In 1867 Baker had written a series of articles, "Long Span Bridges," discussing the application of cantilevers, which were later used in his bridge over the Firth of Forth (1882–90). At the completion of that bridge, Baker was knighted. He served on numerous government commissions and boards and, among other assignments as a consultant, implemented William Willcocks' plans for the Aswān Dam (built 1898–1902). In the United States he was consulted by James B. Eads on the construction of the St. Louis bridge over the Mississippi River, and, when the first Hudson River tunnel threatened to fail, Baker was called in to design a tunneling shield that allowed work to be completed. Baker was president of the Institution of Civil Engineers in 1895–96 and was a vice president of the Royal Society from 1896.

Baker, Carlos (Heard) (b. May 5, 1909, Biddeford, Maine, U.S.—d. April 18, 1987, Princeton, N.J.), American teacher, novelist, and critic known for definitive biographies of Ernest Hemingway and Percy Bysshe Shelley.

Baker received his Ph.D. from Princeton University (1940) and became professor of English there in 1951. His book *Shelley's*

Major Poetry *The Fabric of a Vision* (1948) dwells on Shelley's inner self as visible in his poetry and largely ignores the exterior circumstances of the poet's life. Baker examines Shelley's work within a literary chronology and traces the poet's personal changes through his poems, revealing a many-faceted man. His widely acclaimed *Hemingway: The Writer as Artist* (1952) is regarded as one of the definitive works on the writer. It provides a portrait of an artist and his generation and a critique of Hemingway's novels in moral and aesthetic terms. Baker's *Ernest Hemingway: A Life Story* (1969) is an authoritative biography of the writer. Baker also edited Hemingway's letters into a comprehensive volume.

Baker, George: see Divine, Father.

Baker, George Fisher (b. March 27, 1840, Troy, N.Y., U.S.—d. May 2, 1931, New York, N.Y.), American financier, bank president, and philanthropist who endowed the Graduate School of Business Administration at Harvard.

George Fisher Baker

By courtesy of the Library of Congress, Washington D.C.

When the national banking system was created in 1863, Baker joined with several New York stockbrokers to establish the First National Bank of New York City. Beginning as a teller and small stockholder, he was the active head of the bank by the age of 25. By 1909, when he became chairman of the board, he ranked with J.P. Morgan and James Stillman as a force in American finance and served as director of many corporations. In addition to his gift of \$6 million to Harvard, he made large gifts to other institutions, including New York City's Metropolitan Museum of Art and the American Red Cross.

Baker, George Pierce (b. April 4, 1866, Providence, R.I., U.S.—d. Jan. 6, 1935, New York, N.Y.), teacher of some of the most notable American dramatists, among them Eugene O'Neill, Philip Barry, Sidney Howard, and S.N. Behrman. Emphasizing creative individuality and practical construction (he guided students' plays through workshop performances), Baker fostered an imaginative re-

George Pierce Baker, detail of an oil painting by Deane Keller, 1933; in the Yale University Art Gallery

alism. The critic John Mason Brown and the novelists John Dos Passos and Thomas Wolfe also studied under Baker, who appears as Professor Hatcher in Wolfe's autobiographical novel *Of Time and the River*.

Baker graduated from Harvard University in 1887 and remained there to teach. In 1905 he started his class for playwrights, "47 Workshop" (named after its course number), the first of its kind to be part of a university curriculum. He concerned himself not only with writing but also with stage design, lighting, costuming, and dramatic criticism. Baker's annual lecture tours, following a lectureship at the Sorbonne in 1907, introduced many Americans to European ideas of theatre art. His university productions pioneered advanced staging techniques in the United States.

From 1925 until he retired in 1933, Baker was professor of the history and technique of drama at Yale University, founding a drama school there and directing the university theatre. Many innovative techniques in theatre, motion-picture, and television production had their origins in his work at Yale. Of his writings, the best known are *The Development of Shakespeare as a Dramatist* (1907) and *Dramatic Technique* (1919).

Baker, James Addison, III (b. April 28, 1930, Houston, Texas, U.S.), American government official, political manager, and lawyer who occupied important posts in the Republican presidential administrations of the 1980s and early '90s, including that of U.S. secretary of state (1989-92).

The son of a prosperous Houston attorney, Baker graduated from Princeton University in 1952 and then spent two years in the U.S. Marine Corps. He earned a law degree from the University of Texas at Austin in 1957 and then joined a major Houston law firm, eventually becoming a partner in it. In 1970 Baker's longtime friend George Bush asked him to run Bush's political campaign for the U.S. Senate. Though Bush lost the race, Baker became deeply involved in Republican Party politics thereafter. He was named under secretary of commerce by President Gerald Ford in 1975, and that same year he helped Ford secure the Republican Party's presidential nomination for the 1976 election. Baker served as Ford's campaign manager that year and went on to direct Bush's campaign for the presidential nomination in the Republican primaries of 1980. After Bush accepted the vice presidential slot on a ticket headed by Ronald Reagan that year, Baker joined Reagan's campaign staff as a senior adviser. After Reagan won the election, he appointed Baker White House chief of staff, a post that Baker filled ably until he was made secretary of the Treasury in 1985.

Baker adroitly managed George Bush's successful campaign for the presidential election of 1988 and thereupon was appointed secretary of state. In the latter post he helped the United States reach agreement with the Soviet Union on the reunification of East with West Germany in 1990. In 1990-91 he helped orchestrate the international coalition that opposed Iraq's invasion of Kuwait. Baker was a shrewd and highly effective political manager whose skills were a major factor in the Republicans' retention of the presidency throughout the 1980s. He resigned his post as secretary of state in 1992 in order to serve as White House chief of staff while simultaneously directing Bush's reelection campaign.

Baker, Dame Janet, in full DAME JANET ABBOTT BAKER (b. Aug. 21, 1933, Hatfield, Yorkshire, Eng.), English operatic mezzo-soprano, known for her vocal expression, stage presence, and effective diction. As a recitalist she was noted for her interpretations of the works of Gustav Mahler, Sir Edward Elgar, and Johann Sebastian Bach.

She studied voice in London until 1956, when she won second prize in the Kathleen Ferrier Award, which paid for her studies at the Mozarteum in Salzburg, Austria. She made her operatic debut in 1956 at the Oxford University Opera Club as Roza in Bedřich Smetana's *The Secret* and also sang Eduige in *Rodelinda*, the first of many memorable performances of George Frideric Handel's and other Baroque composers' operatic roles at the Barber Institute in Birmingham.

In 1962 Baker sang the female lead in Henry Purcell's *Dido and Aeneas* and was Polly in Benjamin Britten's *The Beggar's Opera* the following year. In 1971 she created the role of Kate Julian, written especially for her, in Britten's *Owen Wingrave*, first for television and then for the stage. She also won the Hamburg Shakespeare Prize that year. She performed successfully in the Raymond Leppard revivals of early Italian operas, notably as Penelope in Claudio Monteverdi's *Il Ritorno d'Ulisse in patria* in 1972. She sang the 1975 premiere performance of Dominick Argento's song cycle *From the Diary of Virginia Woolf*, which won the Pulitzer Prize. In the following year she was made a Dame of the British Empire. She retired in 1982.

Baker, Josephine (b. June 3, 1906, St. Louis, Mo., U.S.—d. April 12, 1975, Paris, Fr.), dancer and singer who symbolized the beauty and vitality of black American culture, which took Paris by storm in the 1920s.

As a child Baker developed the taste for the flamboyant that was later to make her famous. As an adolescent she became a dancer, touring at 16 with a dance troupe from Philadelphia. In 1923 she joined the chorus in a road company performing the musical comedy *Shuffle Along* and then moved to New York City, where she advanced steadily through the show *Chocolate Dandies* on Broadway and the floor show of the Plantation Club. In 1925 she went to Paris to dance at the Théâtre des Champs-Élysées in *La Revue nègre* and introduced her *danse sauvage* to France. She went on to become one of the most popular music-hall entertainers in France and achieved star billing at the Folies-Bergère, where she created a sensation by dancing seminude in a skirt

Josephine Baker

H. Roger-Viollet

made only of bananas. She became a French citizen in 1937. She sang professionally for the first time in 1930, made her screen debut as a singer four years later, and made several more films before World War II curtailed her career.

During the German occupation of France, Baker worked with the Red Cross and the Résistance, and as a member of the Free French forces she entertained troops in Africa and the Middle East. She was later awarded the Croix de Guerre and the Legion of Honour with the rosette of the Résistance. After the war much of her energy was devoted to Les Milandes, her estate in southwestern France, from which she began in 1950 to adopt babies of all na-

ationalities in the cause of what she defined as "an experiment in brotherhood" and her "rainbow tribe." She retired from the stage in 1956, but to maintain Les Milandes she was later obliged to return, starring in *Paris* in 1959. She traveled several times to the United States during the 1960s to participate in civil-rights demonstrations, and she continued to perform occasionally until her death.

Baker, LaFayette Curry (b. Oct. 13, 1826, Stafford, N.Y., U.S.—d. July 3, 1868, Philadelphia, Pa.), chief of the U.S. Federal Detective Police during the American Civil War and director of Union intelligence and counterintelligence operations.

In 1848 Baker left his home in Michigan, where the family had moved when he was a child, and worked at a variety of occupations in the West. In 1856 he joined the San Francisco Vigilance Command (known as the Vigilantes), a group of self-appointed police whose operations were characterized by arbitrariness and lack of due process. In the next four years he was often employed in an undercover capacity and became adept at techniques of deception and disguise. When the Civil War broke out in 1861, he went to Washington, D.C., and offered his services to General Winfield Scott. Sent to reconnoitre the Richmond, Va., area, he was arrested as a spy but escaped while Confederate president Jefferson Davis sought to determine the validity of the charge.

Baker later worked as a detective in the War Department, the State Department, and the Post Office before succeeding Allan Pinkerton as head of the federal secret service in November 1862. Baker soon penetrated every area of the military and the civil government of the Union as well as the Confederacy, using hundreds of agents and detectives deployed in two forces whose members were unknown to each other.

Baker adopted the motto "Death to Traitors" for himself and his service. He maintained a headquarters and a prison in the Old Capitol building, where he detained many citizens on flimsy evidence or mere suspicion and subjected them to intensive interrogation to extract confessions and information. In 1863 he raised a battalion of cavalry, officially known as the 1st District of Columbia Cavalry but more widely called Baker's Rangers. The unit was used primarily as a counter-guerrilla force against J.S. Mosby and his raiders and was expanded to a full regiment before the war was over.

In 1864 Baker personally uncovered a major fraud in the Treasury Department; broke up the "Northwest Conspiracy," a plan by Confederate terrorists to carry the war to the cities of the North by arson and other means; and uncovered acts of trading with the enemy by prominent Union officials. After Lincoln was assassinated in April 1865, Baker personally planned and managed the pursuit and capture of John Wilkes Booth and his accomplice, D.E. Herold. Baker was accused of negligence in Lincoln's death but, in fact, had no direct responsibility for the president's protection and was on duty in New York when the assassination occurred. His quick response won him a long-sought promotion to brigadier general.

After the Civil War Baker continued his police and intelligence activities, paying particular attention to a large trade in pardons for former Confederates that reached into the White House. Baker, whose disdain for due process frequently left him open to political attack, eventually resigned his post, and his secret service was disbanded when Congress refused it further funding. Baker later testified at Johnson's impeachment trial, making sensational but undocumented charges against

the president. In 1867 he published *History of the United States Secret Service*.

Baker, Newton D(iehl) (b. Dec. 3, 1871, Martinsburg, W.Va., U.S.—d. Dec. 25, 1937, Cleveland, Ohio), lawyer, political leader, and U.S. secretary of war during World War I.

In 1897 Baker began to practice law in his hometown, moving later to Cleveland, where he served two terms (1912–16) as mayor. Baker, who had played an important role in

Woodrow Wilson's nomination in the Democratic National Convention of 1912, was appointed secretary of war by President Wilson and remained in the Cabinet to the end of Wilson's term of office. Although he was, as he himself said, so much of a pacifist that "he would fight for peace," he soon submitted to Congress a plan for universal military conscription, and he efficiently presided over the mobilization of more than 4 million men during World War I.

In 1928 he was appointed by President Calvin Coolidge to the Permanent Court of Arbitration at The Hague, and in 1929 President Herbert Hoover named him to the Law Enforcement Commission. His book, *Why We Went to War*, appeared in 1936.

Baker, Ray Stannard, pseudonym DAVID GRAYSON (b. April 17, 1870, Lansing, Mich., U.S.—d. July 12, 1946, Amherst, Mass.), American journalist, popular essayist, literary crusader for the League of Nations, and authorized biographer of Woodrow Wilson.

A reporter for the *Chicago Record* (1892–98), Baker became associated with *Outlook*, *McClure's*, and the "muckraker" *American Magazine* (1906). He explored the situation of black Americans in *Following the Color Line* (1908). As David Grayson he published *Adventures in Contentment* (1907), the first of his several collections of widely read essays. From 1910, when he first met Woodrow Wilson, Baker became an increasingly fervent admirer. At Wilson's request, Baker served as head of the American Press Bureau at the Paris peace

conference (1919), where the two were in close and constant association. Despite prolonged ill health, Baker wrote *Woodrow Wilson: Life and Letters*, 8 vol. (1927–39). He was awarded the Pulitzer Prize for the work in 1940.

Baker, Sir Samuel White (b. June 8, 1821, London, Eng.—d. Dec. 30, 1893, Sanford Orleigh, Devon), English explorer who, with John Hanning Speke, helped to locate the sources of the Nile River.

The son of a merchant, Baker lived on the Indian Ocean island of Mauritius (1843–45) and in Ceylon (1846–55) before traveling through the Middle East (1856–60). In 1861, with Florence von Sass (who later became his second wife), he went to Africa and for about a year explored the Nile tributaries around the Sudan and Ethiopia border. Using maps supplied by Speke, the Baker expedition set out in February 1863 to find the source of the Nile. In March 1864 Baker determined the source to be a lake, which he named Albert Nyanza (Lake Albert), lying between modern Uganda and Zaire. He was knighted in 1866, the year after he returned to England.

Sir Samuel Baker

BBC Hulton Picture Library

In 1869 the Ottoman viceroy of Egypt, Ismā'il Pasha, asked Baker to command a military expedition to the Nile equatorial regions. There the explorer helped to put down the slave trade and annexed territories of which he was appointed governor general for four years. His books include *The Rifle and the Hound in Ceylon* (1854) and *The Nile Tributaries of Abyssinia* (1867).

Baker, Sara Josephine (b. Nov. 15, 1873, Poughkeepsie, N.Y., U.S.—d. Feb. 22, 1945, New York, N.Y.), American physician who contributed significantly to public health and child welfare in the United States.

After earning an M.D. from the Women's Medical College of the New York Infirmary for Women and Children in 1898, Baker began working for the New York City Health Department, becoming assistant commissioner in 1907. Her concern with the city's high infant mortality rate led to the establishment the next year of the Division of Child Hygiene—the first public agency solely devoted to child health and a model for similar agencies around the world.

As the division's first director, Baker developed pioneering programs that drew public attention to the value of preventive medicine. Her achievements include the introduction of public school health measures, midwife training schools, and baby health stations that dispensed both milk and advice. In 1909 Baker helped to found the American Child Hygiene Association, and in 1911 she organized the Babies Welfare Association, later the Children's Welfare Federation of New York.

In 1917 Baker earned from New York Uni-

versity the first doctorate ever awarded to a woman in the field of public health. After her retirement in 1923, she became a consultant to the federal Children's Bureau and a representative on child health issues to the League of Nations.

Her publications comprise more than 250 popular and scholarly articles and five books on child hygiene. Her autobiography, *Fighting for Life*, was published in 1939.

Baker, Theodore (b. June 3, 1851, New York, N.Y., U.S.—d. Oct. 13, 1934, Dresden, Ger.), American music scholar and lexicographer.

Trained as a young man for business, Baker preferred to study music and went to Germany in 1874 for that purpose. He became a pupil of Oskar Paul at the University of Leipzig and received his Ph.D. there in 1882. His dissertation, based on field research among the Seneca Indians in New York, was the first serious study of American Indian music and provided themes for Edward MacDowell's *Second (Indian) Suite for Orchestra*.

Baker lived in Germany until 1890, returning to the United States the following year and becoming (1892) the literary editor and translator for the publishing house of G. Schirmer, Inc. He remained at Schirmer until his retirement in 1926, when he returned again to Germany.

In addition to his many English translations of books, librettos, and articles (especially those appearing in the *Musical Quarterly*, a Schirmer publication), Baker compiled a useful and popular *Dictionary of Musical Terms* (1895) and *Baker's Biographical Dictionary of Musicians* (1900), the work for which he is best known. This last volume included the names of many musicians never previously mentioned in musical reference works. A second edition was published in 1905, and the dictionary underwent several revisions, the 8th edition being published in 1992.

Baker Island, formerly NEW NANTUCKET, or PHOEBE ISLAND, unincorporated territory of the United States in the South Pacific Ocean, 1,650 miles (2,650 km) southwest of Honolulu. A coral atoll rising to 25 feet (8 m), it measures 1 mile long by 0.7 mile wide and has a land area of about 0.6 square mile (1.5 square km). The uninhabited island is arid and is fringed by a reef.

Sighted (1832) by an American mariner, Captain Michael Baker, the island was claimed (1857) along with nearby Howland Island by the United States under the Guano Act of 1856, but its guano deposits are now exhausted. In the 1930s, rising interest in transpacific aviation prompted the United States to strengthen its claim on Baker by colonizing it from Hawaii. In 1936 it came under the administration of the U.S. Department of the Interior. Evacuated in early 1942, the island was reoccupied by U.S. forces in late 1943, and an air base was built.

Baker v. Carr (1962), U.S. Supreme Court case that forced the Tennessee legislature to reapportion itself on the basis of population. Traditionally, particularly in the South, the populations of rural areas had been overrepresented in legislatures in proportion to those of urban and suburban areas. Prior to the Baker case, the Supreme Court had refused to intervene in apportionment cases; in 1946 in *Colegrove v. Green* the court said apportionment was a "political thicket" into which the judiciary should not intrude. In the Baker case, however, the court held that each vote should carry equal weight regardless of the voter's place of residence. Thus the legislature of Tennessee had violated the constitutionally guaranteed right of equal protection (*q.v.*).

Chief Justice Earl Warren described this decision as the most important case decided after his appointment to the court in 1953.

Citing the Baker case as a precedent, the court held in *Reynolds v. Sims* (1964) that both houses of bicameral legislatures had to be apportioned according to population. It remanded numerous other apportionment cases to lower courts for reconsideration in light of the Baker and Reynolds decisions. As a result, virtually every state legislature was reapportioned, ultimately causing the political power in most state legislatures to shift from rural to urban areas.

Bakersfield, city, seat (1875) of Kern county, south-central California, U.S., in the San Joaquin Valley. It was founded along the Los Angeles and Stockton road in 1869 by Thomas Baker, who reclaimed swamplands along the nearby Kern River. It was an agricultural trade centre for the mines of the Sierra Nevada and the Owens Valley in the 1870s. The Southern Pacific Railroad reached the town in 1874 and the Santa Fe Railway did in 1898. Both railroads established workshops at Bakersfield. San Francisco capitalists, acquiring large-scale landholdings in the area, helped to develop an extensive irrigation system to distribute the waters of the Kern River, after which the region became important in the production of grain, alfalfa, and livestock. The discovery of the Kern River oil fields in 1899 brought an extensive petroleum industry, which was centred at Bakersfield.

The town was quickly rebuilt after a fire destroyed the business section in 1889 and again after an earthquake brought widespread damage in 1952. Bakersfield grew steadily throughout the 20th century, with expanding petroleum-based industries, livestock raising, and the mechanized farming of potatoes, grapes, alfalfa, cotton, and grain. Nearby vineyards produce about one-fourth of the wine made in California. The city has diversified industries manufacturing steel products, textiles, bedding materials, and electronic parts. Tourism is also important. Two important aerospace facilities, the Naval Ordnance Test Station and Edwards Air Force Flight Test Center, are nearby. California State University, Bakersfield, was founded in 1965. Inc. 1898. Pop. (1992 est.) city, 187,985; Bakersfield MSA, 563,678.

Bakewell, Robert (b. 1725, Dishley, Leicestershire, Eng.—d. Oct. 1, 1795, Dishley), agriculturist who revolutionized sheep and cattle breeding in England by methodical selection, inbreeding, and culling.

Bakewell's father was a farmer, with a farm of 440 acres (178 hectares) at Dishley. As a young man, Bakewell traveled about the country learning agricultural techniques and returned to the farm of his ailing father (who

died in 1760). There Bakewell became one of the first to breed both sheep and cattle for meat; previously the animals were bred primarily for wool or work. He developed the Leicestershire longhorn cattle into good meat producers, but they were poor suppliers of milk and were later supplanted by the Short-horns bred by Charles Colling.

Bakewell had more permanent success in developing the Leicester sheep, a barrel-shaped animal that produced long, coarse wool and also provided a good yield of high-quality meat. The first to establish on a large scale the practice of letting animals for stud, he made his farm famous as a model of scientific management.

Bakewell glass, glassware produced at the factory completed in 1808 in Pittsburgh, Pa., U.S., by Benjamin Bakewell, an Englishman from Derby who became known as the father of the flint-glass industry in the United States. The Pittsburgh Flint Glass Manufactory, then Bakewell & Company, and later Bakewell & Page, operated until 1882. In 1810 the factory began to produce both cut and engraved glass, and from the outset the firm was noted for quality and for the brilliance of its cutting. Since American cut glass was both a novelty and a luxury, the firm attracted considerable attention, and until about 1819 Bakewell's factory was the only one making cut and engraved tablewares; among its important early commissions was a comprehensive service of engraved glassware for President James Monroe (1817). Early Bakewell glass is characterized by its elaborate decoration and by its use of shapes and cutting patterns adapted from contemporary Irish glass. Around 1824 a number of cut glass tumblers were produced that had embedded in their bases a bas-relief ceramic profile of an outstanding American (*e.g.*, George Washington, Benjamin Franklin, Andrew Jackson).

The first known patent for pressing glass by mechanical means was granted to John P. Bakewell in 1825 to make pressed glass knobs for furniture. This invention led to the mass production of glass, and for the first time glass tableware and ornamental glass became economical for all income levels.

Bakhchysaray, Russian BAKHCHISARAY, also spelled BACHČISARAJ, city, southern Crimea, Ukraine, on the Simferopol-Sevastopol railway. Before passing to Russia in 1783, it was the capital of the Crimean khanate. The city has many buildings of historical and architectural interest, including the palace of the Tatar khans built in 1519. Pop. (1991 est.) 26,600.

Bakmut (Ukraine): *see* Artemivsk.

Bakht Khan (b. c. 1797—d. 1859), commander in chief of rebel forces in the early stages of the anti-British Indian Mutiny (1857).

Related on his mother's side to the ruling house of Oudh (deposed by the British in 1856), Bakht Khan served for a number of years as a field battery commander in the army of the British East India Company. When the rebellion broke out in May 1857, he led his troops to Delhi, where he emerged as the dominant figure in the independent Indian government proclaimed by the rebels. To control the figurehead Mughal emperor, he established a court of administration, the members of which were elected by the army and the government departments. Forced out of Delhi by the British in September, he is said to have been killed in battle during the last days of the Mutiny.

Bakhtarān, formerly KERMĀNSHĀH, city, western Iran. The city lies in the fertile valley of the Qareh Sū (river) and is situated on the ancient caravan route between the Mediterranean Sea and central Asia. It was founded in the 4th century AD by Bahrām IV of the Sāsānian dynasty. Conquered by the Arabs

Bakewell, detail of an engraving
The Mansell Collection

in 640, the town was called Qirmasin (Qirmashin). Under Seljuq rule in the 11th century, it was the chief town of Kordestān. The Šafavids (ruled 1501–1736) fortified the town, and the Qājārs repulsed an attack by the Turks during Fath ‘Alī Shāh’s rule (1797–1834). Occupied by the Turkish Army in 1915 during World War I, it was evacuated in 1917. The construction of a road in the 1950s over the age-old Khorāsān track added considerably to the importance of the city. It is now a fairly important industrial centre.

The surrounding region is one of the richest agricultural areas of Iran; its agriculture is now mostly mechanized. Irrigation is largely used in the upland valleys. Wheat and barley, corn (maize), clover, beans, oilseeds, rice, fruit, and vegetables are the main crops, and the hills in the area provide good pasturage. The inhabitants are mainly Kurds of many different tribes, most of whom settled in urban areas after World War II. The history of the area extends back into antiquity, as many local monuments of Achaemenid and Sāsānid origin demonstrate—e.g., the rock carvings at Bīsūtūn and Tāg-e Bostān. There are also many prehistoric remains in the form of mounds and formerly inhabited caves. Pop. (1996) 692,986.

Bakhtiari rug, also spelled BAKHTIYĀRĪ, handwoven pile floor covering made under Bakhtiyārī patronage in certain villages of the area southwest of Isfahan in central Iran. Bakhtiari rugs are Ghiordes-knotted on a foundation of cotton.

Bakhtiari rug from Iran, 20th century; in a New Jersey private collection

In a New Jersey private collection, photograph, Otto E. Nelson—EB Inc

The colouring and patterns of these rugs are bold. The field is usually divided into compartments that may be rectangular or produced by an ogival lattice. Occasionally there are tree or medallion decorative schemes. The palette is strong to the point of harshness, with much use of yellow.

Bakhtin, Mikhail, in full MIKHAIL MIKHAILOVICH BAKHTIN (b. Nov. 17 [Nov. 5, Old Style], 1895, Orel, Russia—d. March 7, 1975, Moscow, U.S.S.R.), Russian literary theorist and philosopher of language whose wide-ranging ideas significantly influenced Western thinking in cultural history, linguistics, literary theory, and aesthetics.

Bakhtin is especially known for his work on the Russian writer Fyodor Dostoyevsky, *Problemy tvorchestva Dostoyevskogo* (1929; 2nd ed., 1963, retitled *Problemy poetiki Dostoyevskogo: Problems of Dostoyevsky's Poetics*). In the book Bakhtin expressed his belief in a mutual relation between meaning and context involving the author, the work, and the reader,

each constantly affecting and influencing the others, and the whole influenced by existing political and social forces. Bakhtin further developed this theory of polyphony, or “dialogics,” in *Voprosy literatury i estetiki* (1975; *The Dialogic Imagination*), in which he postulated that language evolves dynamically and is affected by and affects the culture that produces and uses it. A concomitant Bakhtinian phrase is “heteroglossia” (or “multiple voices”), referring to the interaction of the socioideological languages existing within a society. Bakhtin also wrote *Tvorchestva Fransua Rable i narodnaya kultura srednevekovya i Rennsansa* (1965; *Rabelais and His World*).

Bakhtiyārī, also spelled BAKHTIYĀRĪ, one of the nomad peoples of Iran; its chiefs have been among the greatest tribal leaders in Iran and have long been influential in Persian politics. The Bakhtiyārī population of approximately 1,000,000 occupies roughly 25,000 square miles (65,000 square km) of plains and mountains in western Iran. They speak the Lurī dialect of Persian and are Shī‘ite Muslims.

Many of the Bakhtiyārī are nomadic, pastoral tent dwellers who are dependent on their flocks of sheep, goats, and cattle. They migrate their flocks 150 miles each year between their winter pastures in the plains and the summer pastures of the mountains. Agricultural products are mainly obtained by trade or as tax from dependent villages. There has been some urbanization among the Bakhtiyārī resulting from the oil industry.

The Bakhtiyārī are divided into two main tribal groups, the Chahār Lang (“Four Legs”) and the Haft Lang (“Seven Legs”). Each of these groups is controlled by a single chiefly family that holds extensive political power and owns sizable herds and farmlands. The position of *khān*, or paramount leader, of the Bakhtiyārī is held for two years by the chief of the Haft Lang, with the chief of the Chahār Lang as his *ilbeg*, or deputy. For the next two years the two chiefs exchange their posts with each other.

Bakhtiyārī chiefs have long been influential in Iranian politics. In 1909 Bakhtiyārī tribesmen under the Haft Lang chief Sardar Assad captured Tehrān in their successful campaign to press for constitutional reforms in Iran. Many Bakhtiyārī have held prominent public offices since then.

Bakhtiyārī women have long enjoyed a high degree of freedom that is atypical of Muslim women elsewhere. The daughters of tribal leaders are normally given at least an elementary education.

Bakhuis Gebergte, range of hills, west central Suriname, running north–south, about 70 miles (110 km) in length and separating the basins of the Kabalebo and Nickerie rivers (west) from that of the Coppename River (east). The range is relatively low-lying, comprising a northward continuation of the higher Wilhelmina Gebergte, to the south; it reaches a maximum height of 3,369 feet (1,027 m).

Bākī, also spelled BĀQĪ, in full MAHMUD ABDŪLBĀKĪ (b. 1526, Constantinople [now Istanbul]—d. April 7, 1600, Constantinople), one of the greatest lyric poets of the classical period of Ottoman Turkish literature.

The son of a muezzin, he lived in Constantinople. After an apprenticeship as a saddler, he entered a religious college, where he studied Islāmic law. He also came into contact with many famous men of letters and began to write poetry. In 1555 Bākī submitted a qasida (ode) to the Ottoman sultan, Süleyman I, thereby gaining an entrée into court circles. At Süleyman’s death he wrote his masterpiece, an elegy on the sultan that combines grandeur of style with sincere feeling. Later Bākī resumed his religious career, aspiring unsuccessfully to the position of *shaykh al-Islām*, the highest religious office in the empire. He wrote several religious treatises, but his *Divan* (“Collected

Poems”) is considered his most important work. He is especially known for his ghazels (lyrics), in which he laments the ephemeral nature of youth, happiness, and prosperity and urges the reader to enjoy the pleasures of love and wine while he can. His mastery of form expresses itself in perfect versification, a meticulous choice of words, and a skillful use of onomatopoeic effect by which he achieves great musicality. A witty man of the world in his private life, Bākī rejuvenated Ottoman lyric poetry, breaking with the strict laws of classical prosody and instilling a freshness and vitality of both form and imagery that won for him the coveted title of *sulṭān ash-shu‘arā’* (“king of poets”) in his own lifetime.

baking, process of cooking by dry heat, especially in some kind of oven. Bakery products comprise a wide variety of foods, including bread, cookies, pies, pastries, and muffins.

A brief treatment of baking and bakery products follows. For full treatment, see MACROPAEDIA: Food Processing.

Baking dates, in its most rudimentary form, to prehistoric times. At first it involved nothing more than the simple drying of grain seeds in the sun. Eventually the seeds came to be cooked in water, and the resulting gruel was baked on a hot stone, producing a kind of flat bread that was in many ways similar to the Mexican tortilla.

The process of leavening—that is, making bread lighter, thicker, and more flavourful—developed slowly. The Egyptians, it is believed, were the first to consciously use leavening in their baking and also were the first to use ovens. By the middle of the 3rd century BC, they had developed baking methods similar in many ways to those in use today.

During the centuries following, no major advances in baking methods were made, although the Romans introduced some minor technological improvements. Only with the Industrial Revolution of the mid-19th century did the technology of baking begin to advance rapidly. The quality of ingredients improved, and automation began to replace the time-consuming manual process; both developments led to the establishment of a baking industry that by the 20th century produced a wide variety of goods with highly elaborate and efficient machinery.

Only wheat and rye flours have the qualities necessary for the expansion of an initial dough or batter, and wheat is more satisfactory. Although various flours are used in baking, some amount of wheat flour must be added if any significant degree of leavening is desired. Protein in the flour, known as gluten, combines with water to produce an elastic and porous web capable of trapping gas bubbles released by the action of a leavening agent. In bread and in some other sweeter rolls and pastries, baker’s yeast (composed of living cells of the *Saccharomyces cerevisiae* yeast strain) is used to create the leaven. It ferments sugars present in the flour and in other ingredients, giving off carbon dioxide and ethanol. Another leavening method is the use of sourdough, a type of dough that contains acid-generating bacteria that ferment the sugars. Such sweeter bakery products as layer cakes, biscuits, cookies, and muffins make use of chemical reactions rather than fermentation for leaven. Sodium bicarbonate (baking soda) is most commonly used, but it must be properly combined with counteracting acids in order to release a sufficient amount of carbon dioxide. Such a combination is provided in baking powder, whose formula also serves to regulate the timing of the gas’s release.

Another important method of leavening batters is the mixing in of air bubbles from the outside atmosphere. This can be accomplished

only by the inclusion of an ingredient (often egg whites) that can easily be beaten into a foam that can hold air bubbles. This method produces a particularly light and delicate product (for example, angel food or sponge cake).

Important ingredients for baking other than flour, water, and leavening agents are shortening (fats, butter, oils, lard), eggs, milk, and sugars. Shortening tends to make doughs more easily workable and the final product tenderer, while also, in many cases, adding flavour. Egg whites, as mentioned, are often used to produce a light, airy texture, and yolks contribute to the colour, flavour, and texture of baked products. Milk is used for flavouring, and sugars to sweeten and to aid fermentation.

Commercial bakeries employ a variety of techniques ranging from the use of simple home baking methods by smaller companies to the use of highly complex and automated equipment in large commercial operations. Even in many larger bakeries, however, the basic steps of baking in batches remain the same; the ingredients are simply used in much larger quantities. Measured accurately by computers, the ingredients are first mixed into dough or batter, sometimes in large horizontal machines with revolving bars that work the mixture into a uniform structure, and other times in giant mixing bowls similar, except in size, to those found in the home. With yeast-leavened goods, mixing is often done in two stages, permitting an interim period of fermentation and a chance for more control over the variability that some ingredients exhibit from batch to batch. When the ingredients are mixed (and, in the case of yeast leavening, the dough properly fermented), an elaborate series of machines that vary with the product separate and shape the dough or batter into individual units and prepare these for final baking. The batch is then placed in an oven and cooked to specifications.

Continuous baking, an alternative to the batch method, substitutes a steady flow of dough or batter through processing machines in place of the discrete amount of mixtures handled in batches. The ingredients are mixed and fermented in a liquid or semiliquid state and are then cooled into a continuous piece of dough or stream of batter. This is pushed out through an opening of the mixing machine at a steady rate and is sliced into uniform pieces, or it is poured into standardized containers and passed slowly on a conveyor belt through an open-ended oven.

baking powder, leavening agent (*q.v.*) used in making baked goods.

Bakkah (Saudi Arabia): *see* Mecca.

baklava, rich Turkish, Greek, and Middle Eastern pastry of phyllo (filo) dough and nuts. Phyllo is a simple flour-and-water dough that is stretched to paper thinness and cut into sheets, a process so exacting that it is frequently left to commercial manufacturers. For baklava, 30 or 40 sheets of phyllo, each brushed liberally with melted butter, are layered in a baking pan with finely chopped walnuts, pistachios, or almonds. After the pastry is baked it is drenched with a syrup of honey and lemon juice. Cinnamon, ground cloves, cardamom, or rosewater may flavour either the filling or the syrup.

Bakongo (people): *see* Kongo.

Bakony Mountains, mountain range in western Hungary, covering about 1,500 square miles (4,000 square km) between Lake Balaton and the Little Alfold and running southwest-northeast for 70 miles (110 km) from the Zala River. The range forms the major component of the highlands of Dunántúl, or Transdanubia (the Bakony, Vértes, Gerecse, Budai and

Pilis, and Visegrád mountains). The Keszthely and Balatoni Felvidék mountain groups are separated from the main Bakony range by the Tapolca basin and a fault, respectively. Lake Balaton occupies a large tectonic depression south of the Bakony. The mountains consist of flat-topped or undulating fragments of a step-faulted range rising toward the north. Limestone and dolomite constitute most of the Bakony, which range from 700 to 2,300 feet (210 to 700 m). In western and southern Bakony are sheets of basalt. Deposits of lignite, bauxite, and manganese in the Bakony have stimulated industrial development, as at Veszprém and Ajka. Additional deposits of bauxite were discovered in the 1970s near the village of Inarkül. The formerly dense forest cover has been partially removed to provide farmlands in the basins and on the lower flat-tops. Precipitation is moderate (31 inches [800 mm] on the highest parts); most of this seeps through the limestone to emerge as springs on the mountain perimeter. The south-facing slopes overlooking Lake Balaton support a thriving wine industry.

Bakoye River, river in western Africa, rising in the Fouta Djallon massif of Guinea and flowing generally northeast through the sandstone Mandingues Hills to the Mali border. It then flows north-northwest through less elevated terrain to be fed by the Baoulé River. It turns west down a river valley until, at Bafoulabé, Mali, it merges with the Bafing River to form the Sénégal River. The Bakoye is about 250 miles (400 km) long and is unnavigable. It is the only river rising in the area around Sigui, Guinea, that does not flow into the Niger River. Guinea gold from Bouré, on the Bakoye's headstreams, was once an important export.

Bakr, Ahmad Hassan al- (b. 1914, Tikrit, Iraq—d. Oct. 4, 1982, Baghdad), president of Iraq from 1968 to 1979.

Al-Bakr entered the Iraqi Military Academy in 1938 after spending six years as a primary-school teacher. He was a member of the Ba'ath Socialist Party and was forced to retire from the Iraqi army for revolutionary activities in 1959. He became prime minister for 10 months following the Ba'ath coup of 1963 and replaced President 'Abd ar-Rahman 'Arif in the Ba'ath coup of July 17, 1968. Thereafter he governed in concert with the Ba'ath leader Saddam Hussein. His truculent foreign policy effectively isolated him from his Muslim neighbours, and his total opposition to any diplomatic solution to the Arab-Israeli dispute brought him into conflict with more moderate Arab heads of state.

Al-Bakr's border claims against Iran made it impossible to bring the Iraqi Kurds under control until an agreement was reached in 1975. His economic policy began with a cautious continuation of the former regime's five-year plan but turned toward industrial expansion as oil revenues increased. After suffering a heart attack in 1976, al-Bakr delegated most administrative matters to Saddam Hussein, who succeeded him on July 16, 1979.

Baksar (India): *see* Buxar.

Baksar, Battle of, Baksar also spelled BUXAR (Oct. 22, 1764), conflict between the East India Company's forces, commanded by Major Hector Munro, and those of the Mughal emperor, Shāh 'Alam; the Mughal governor of Oudh, Shujā' ud-Dawlah; and the dispossessed governor of Bengal, Mir Qāsim. This decisive battle confirmed the British in the control of Bengal and Bihār after their initial success of Plassey in 1757.

The battle marked the end of the attempt to rule Bengal through a puppet nawab; thenceforth the company took control. In 1765 it was granted the power to collect revenues in Bengal; and Robert Clive began his second governorship, which continued until 1767.

Bakst, Léon, original name LEV SAMOYLOVICH ROSENBERG (b. Feb. 8 [Jan. 27, Old Style], 1866, St. Petersburg, Russia—d. Dec. 28, 1924, Paris, France), Russian artist who revolutionized theatrical design both in scenery and in costume.

Bakst attended the Imperial Academy of Arts at St. Petersburg but was expelled after painting a too-realistic "Pietà." He returned to Russia after completing his studies in Paris and became a court painter. He was a co-founder with Sergey Diaghilev of the journal *Mir Iskusstva* ("World of Art") in 1899. Bakst began to design scenery in 1900, first at the Hermitage court theatre and then at the imperial theatres. In 1906 he went to Paris, where

Costume for an aide-de-camp to the shah for *Scheherazade*, graphite, watercolour, gouache, silver, gold on paper by Léon Bakst, 1910; in the Wadsworth Atheneum, Hartford, Conn.

he began designing stage sets and costumes for Diaghilev's newly formed ballet company, the Ballets Russes. The first Diaghilev ballet for which he designed decor was *Cléopâtre* (1909), and he was chief set designer thereafter, working on the ballets *Scheherazade* and *Carnaval* (both 1910), *Le spectre de la rose* and *Narcisse* (both 1911), *L'après-midi d'un faune* and *Daphnis et Chloé* (both 1912), and *Les papillons* (1914). Bakst achieved international fame with his sets and costumes, in which he combined bold designs and sumptuous colours with minutely refined details to convey an atmosphere of picturesque, exotic orientalism. In 1919 Bakst settled permanently in Paris. His designs for a London production of Peter Ilich Tchaikovsky's *Sleeping Beauty* in 1921 are regarded as his greatest work.

Baku, Azerbaijani BAKY, city, capital of Azerbaijan. It lies on the western shore of the Caspian Sea and the southern side of the Apsheron Peninsula, around the wide, curving sweep of the Bay of Baku. The bay, sheltered by the islands of the Baku Archipelago, provides the best harbour of the Caspian, while the Apsheron Peninsula gives protection from violent northerly winds. The name *Baku* is possibly a contraction of the Persian *bad kube* ("blown upon by mountain winds"). Baku derives its importance from its oil industry and its administrative functions.

The first historical reference to Baku dates from AD 885, although archaeological evidence indicates a settlement there several centuries before Christ. By the 11th century AD, Baku was in the possession of the Shirvān-Shāhs, who made it their capital in the 12th century, although for a period in the 13th and 14th centuries it came under the sway of the Mongols. In 1723 Peter I the Great captured

Fountain in the town square, Baku, Azerbaijan
Luba Paz—Pictorial Parade

Baku, but it was returned to Persia in 1735; Russia captured the town finally in 1806. In 1920 it became capital of the Azerbaijan republic.

The core of present-day Baku is the old town, or fortress, of Icheri-Shekher. Most of the walls, strengthened after the Russian conquest in 1806, survive, as does the 90-ft (27-m) tower of Kyz-Kalasy (Maiden's Tower, 12th century). The old town is highly picturesque, with its maze of narrow alleys and ancient buildings. These include the palace of the Shirvān-Shāhs, now a museum, the oldest part of which dates from the 11th century. Also of the 11th century is the Snyk-Kala Minaret and Mosque (1078–79). Other notable historic buildings are the law court (Divan-Khan), the Dzhuma-Mechet Minaret, and the mausoleum of the astronomer Seida Bakuvi.

Around the walls of the fortress, the regular streets and imposing buildings of modern Baku rise up the slopes of the amphitheatre of hills surrounding the bay. Along the waterfront an attractive park has been laid out. Most industrial plants are located at the eastern and southwestern ends of the city. Greater Baku, divided into 11 districts, encompasses almost the entire Apsheron Peninsula and 48 townships. Among these are townships on islands off the tip of the peninsula and another built on stilts in the Caspian Sea, 60 mi (100 km) from Baku.

The basis of Baku's economy is petroleum. The presence of oil has been known since the 8th century, and by the 15th century oil for lamps was obtained from surface wells. Modern commercial exploitation began in 1872, second only to Ploesti in Romania. The Baku oil field at the beginning of the 20th century was the largest in the world, and it remained the largest Soviet field until the 1940s. Today much of the oil has been exhausted, and, although some wells remain in the city itself, drilling has had to extend to 16,700 ft (5,090 m) underground and outward across the Apsheron Peninsula and into the sea. Many derricks stand in the gulf facing the city. Most of the subordinate townships are drilling centres, linked by a network of pipelines to the local refineries and processing plants. From Baku oil is piped to Batumi on the Black Sea or sent by tanker across the Caspian and up the Volga River. Besides oil processing, Baku is a large centre for the production of equipment for the oil industry, in which 20 factories

are engaged. Other engineering industries are shipbuilding and repair and the manufacture of electrical machinery. Chemicals, cement, textiles, footwear, and foodstuffs are also produced.

Baku is also a major cultural and educational centre, with a university and eight other institutions of higher education, including one specializing in the oil and chemical industries. The Azerbaijan Academy of Sciences comprises numerous scientific-research establishments. The city has a number of theatres and museums as well. Azerbaijanis constitute the largest ethnic group, but there is also a large population of Russians and smaller numbers of other groups. Pop. (1997 est.) 1,727,200.

Baku rug, also called **CHILIA RUG**, handwoven floor covering made near Baku in the eastern Caucasus. It is a variety of Dagestan rug in modified Persian design, the ground pattern usually bearing rows of the pear or leaf forms of the Seraband rugs but larger in scale and more geometric and complex in form. Stepped medallions and stepped cornerpieces may show a toothed outline, resembling the corners of the field of many Ferahan carpets, producing a raylike effect. The border may display a myriad of narrow diagonal stripes, as in some of the rugs from the Shirāz area. The colour scheme may be more muted than is usual in the Caucasus, presumably a concession to the taste of Russian customers. These rugs, with warps and pile of wool, are apt to have wefts of cotton.

Sometimes also ascribed to Baku are certain finely woven Dagestan prayer rugs with rows of pears or leaves, each of which has a serrated outline, as if it were on fire. In these prayer

Baku rug from the Caucasus, 19th century; in a private collection in New York state
In a New York state private collection photograph. Otto E. Nelson

rugs, the warp and weft may show combinations of cotton and silk or wool and cotton strands plied together.

Bakuba (people): *see* Kuba.

bakufu (Japanese history): *see* shogunate.

Bakunin, Mikhail Aleksandrovich (b. May 30 [May 18, old style], 1814, Premukhine, Russia—d. July 1 [June 19, O.S.], 1876, Bern), chief propagator of 19th-century anarchism, a prominent Russian revolutionary agitator, and a prolific political writer. His quarrel with Karl Marx split the European revolutionary movement for many years.

Bakunin was the eldest son of a small landowner in the province of Tver. He grew

up in idyllic surroundings, romantically devoted to four sisters who were nearer to him in age than his younger brothers. His lifetime of revolt began when he was sent to the Artillery School in St. Petersburg and later was posted to a military unit on the Polish frontier. In 1835 he absented himself without leave and resigned his commission, narrowly escaping arrest for desertion. For the next five years he divided his time between Premukhine, where

Bakunin

he plunged into the study of the German philosophers Johann Fichte and Hegel, and Moscow, where he moved in the literary circles of the critic V.G. Belinsky, the novelist Ivan Turgenev, and the publicist Aleksandr Herzen. In 1840, his opinions still in a state of fluid turbulence, he journeyed to Berlin to complete his education. There he fell under the spell of the Young Hegelians, the radical followers of Hegel, and, having moved to Dresden, in 1842 published in a radical journal his first revolutionary credo, ending with the now-famous aphorism: "The passion for destruction is also a creative passion." This brought him a peremptory order to return to Russia and, on his refusal, the loss of his passport. After brief periods in Switzerland and Belgium, Bakunin settled in Paris, where he consorted with French and German Socialists, including Pierre-Joseph Proudhon and Karl Marx, and with numerous Polish émigrés who inspired him to combine the cause of the national liberation of the Slav peoples with that of social revolution. The February Revolution of 1848 in Paris gave him his first taste of street fighting; and after a few days of eager participation he travelled eastward in the hope of fanning the flames in Germany and Poland. In Prague in June 1848, he attended the Slav congress, which ended when Austrian troops bombarded the city; and later in the year, in the secure retreat of Anhalt-Köthen, in Germany, he wrote his first major manifesto, *An Appeal to the Slavs*. He denounced the bourgeoisie as a spent counterrevolutionary force; he called for the overthrow of the Habsburg Empire and the creation in central Europe of a free federation of Slav peoples; and he counted on the peasant and especially on the Russian peasant, with his tradition of violent revolt, as the agent of the coming revolution.

Tired of inaction, Bakunin once more plunged into revolutionary intrigues and, engaging in the Dresden insurrection of May 1849, failed this time to escape arrest. The

Saxon authorities handed him over to Austria and Austria, after a further period of incarceration, to Russia. In May 1851 he was back on Russian soil in the Peter-Paul Fortress in St. Petersburg. There, at the invitation of the chief of police, he wrote an enigmatic *Confession*, which was not published until 1921. Much of it consists of expressions of repentance for misdeeds and abject appeals for mercy. But it includes some gestures of defiance and plays heavily on Bakunin's devotion to the Slavs and hatred of the Germans—sentiments that were noted with interest and approval by the Tsar. They did not, however, help the prisoner. He remained for three years in the Peter-Paul Fortress and for three further years in another fortress, the Schlisselburg, in conditions of rapidly deteriorating health. Finally, in 1857 he was released to live in Siberia. There he contracted a marriage, which was not consummated, with the daughter of a Polish merchant. The governor of Eastern Siberia was a cousin of Bakunin's mother, and it was probably through this connection that he obtained permission in 1861 to travel down the Amur, ostensibly on commercial business. Having reached the coast in a Russian ship, he transferred to an American vessel bound for Japan and travelled via the United States to Great Britain.

Bakunin's arrival in London at the end of 1861 reunited him with Herzen, whom he had last seen in Paris in 1847 and who now occupied a preeminent position among Russian émigrés as editor of *Kolokol* ("The Bell"). Bakunin's 14-month stay in London led to an irretrievable rift with Herzen, who had shed some of the revolutionary ardour of his youth and had already crossed swords with the critic and novelist Nikolay Chernyshevsky and other extreme radicals of the rising Russian generation. He now found Bakunin's financial, as well as political, irresponsibility hard to bear. When the Polish insurrection broke out early in 1863, Bakunin eagerly embarked with a shipload of Polish volunteers for the Baltic. He got only as far as Sweden, where he spent a fruitless summer. At the beginning of 1864 he established himself in Italy, which became his residence for four years. It was there that he framed the main outlines of the anarchist creed that he preached with unsystematic but unremitting vigour for the rest of his life. It was there, too, that he began to weave that complex network, part real, part fictitious, of interlocking secret revolutionary societies that absorbed his energies and bewildered the followers whom he enrolled in them.

The most famous episode of Bakunin's later years was his quarrel with Marx. In 1868, then settled in Geneva, he joined the First International, a federation of working-class parties aiming at transforming the capitalist societies into Socialist commonwealths and their eventual unification in a world federation. At the same time, however, he enrolled his followers in a semisecret Social Democratic Alliance, which he conceived as a revolutionary avant-garde within the International. The same organization could not hold two such powerful and incompatible personalities; and at The Hague congress in 1872 Marx, by an intrigue that had little relation to the causes of the quarrel, secured the expulsion of Bakunin and his followers from the International. The breach split the revolutionary movement in Europe for many years to come. Two of Bakunin's major writings, *L'Empire knouto-germanique et la révolution sociale* (1871) and *Staat en anarchie* (1873), directly reflected his conflict with Marx. Bakunin was as uncompromising a revolutionary as Marx and never ceased to preach the overthrow of the existing order by violent means. But he rejected political control, centralization, and subordination

to authority (while making an unconscious exception of his own authority within the movement). He denounced what he regarded as characteristically Germanic ways of thought and organization and opposed to them the untutored spirit of revolt that he found embodied in the Russian peasant. Bakunin's anarchism took final shape as the antithesis of Marx's communism.

During his last years, which he spent in penury in Switzerland, Bakunin reverted to his preoccupation with central and eastern Europe. He was compromised by a short-lived enthusiasm for S.G. Nechayev, a young Russian nihilist who paraded his contempt for conventional morality, achieved notoriety by murdering a fellow conspirator whom he suspected of intending to betray or desert the cause, and for this crime was eventually extradited to Russia by the Swiss authorities. Bakunin consorted with Russian, Polish, Serb, and Romanian émigrés, among whom he found eager disciples; drafted proclamations; and planned revolutionary organizations. His health grew worse; his financial embarrassments became ever more acute, and he depended on the bounties of a few Italian and Swiss friends. But he never wholly lost the resilience of his revolutionary convictions.

Proudhon and Bakunin rank as the founding fathers of 19th-century anarchism. Bakunin formulated no coherent body of doctrine. His voluminous and vigorous writings were often left incomplete. But his fame and personality inspired a large and widely dispersed following. Small anarchist groups existed in Great Britain, Switzerland, and Germany, whereas the powerful anarcho-syndicalist wing of the French trade unions owed more to Proudhon than to Bakunin. Anarchist movements owing allegiance to Bakunin continued to flourish in Italy and especially in Spain, however, where as late as 1936 the anarchists were the strongest revolutionary party. (E.H.C.)

BIBLIOGRAPHY. The first collection of Bakunin's writings was published in six volumes in French between 1895 and 1913; a complete Russian edition of writings and letters was planned, but only the first four volumes down to 1861 were published (1934–36). A complete edition of the later writings, edited by Arthur Lehning, began publication in 1961 by the Instituut voor Sociale Geschiedenis, Amsterdam. Selected works in English translation were published in G.P. Maximoff (ed.), *Political Philosophy of Bakunin* (1953); Sam Dolgoff (ed.), *Bakunin on Anarchy* (1972); and S. Cox and O. Stevens (eds.), *Selected Writings* (1974, from the Lehning edition). Bakunin has not been well served by biographers: Max Nettlau's manuscript biography (in German), *Michael Bakunin*, 3 vol. (1896–1900), based on a large mass of documents, was distributed to the main European libraries; Y. Steklov's biography (in Russian), 4 vol. (1926–27), is unfriendly and Marxist; E.H. Carr, *Michael Bakunin* (1937), is the best in English.

Bakwanga (Zaire): see Mbuji-Mayi

Bala, Welsh Y BALA, market town, Gwynedd county, historic county of Merioneth (Meirionnydd), Wales, in Snowdonia National Park at the northern end of mountain-girt Bala Lake (Llyn Tegid), the largest natural lake in Wales. The town was founded under a charter of 1324. In the 18th century it became famous both for its knitted stockings and for its huge Methodist revival meetings; it was the home of the Methodist preacher and organizer Thomas Charles. The town has remained small, though it enjoys a thriving tourist trade. The lake offers facilities for angling and yachting. Pop. (1991) 1,922.

Balaam, a non-Israelite prophet described in the Old Testament (Num. 22–24) as a diviner who is importuned by Balak, the king of Moab, to place a malediction on the people of Israel, who are camped ominously on the plains of Moab. Balaam states that he will utter only what his god Yahweh inspires, but

he is willing to accompany the Moabite messengers to Balak. He is met en route by an angel of Yahweh, who is recognized only by Balaam's ass, which refuses to continue. Then Balaam's eyes are opened, and the angel permits him to go to Balak but commands him not to curse but to bless Israel. Despite pressure from Balak, Balaam remains faithful to Yahweh and blesses the people of Israel.

Balabac, island, southwestern Palawan province, extreme southwestern Philippines. Located about 19 miles (30 km) southwest of the southern tip of Palawan island, and hardly twice that north of Borneo, Balabac rises to an elevation of about 1,890 feet (576 m) and has swamps on its northwestern coast. There are coral reefs off its western coast, and the island is particularly noted for its rare glory-of-the-seas cone shells. Philippine territory ends at the southwestern corner of the island, where small motorized canoes operated by Balabac Muslims make frequent border crossings to the nearby islands in Sabah state (Malaysia) off Borneo's northern coast. Coconuts are a major crop on Balabac. Its people are mostly Muslim (Moros). Balabac town is the main centre of settlement. Pop. (1990) 20,056.

Balādhurī, al-, in full AHMAD IBN YAḤYĀ AL-BALĀDHURĪ (d. c. 892), Arabic historian best known for his history of the formation of the Arab Muslim empire.

Al-Balādhurī lived most of his life in Baghdad and studied there and in Syria. He was for some time a favoured visitor at the Baghdad court of the 'Abbāsid caliphs. His chief extant work, a condensation of a longer history, *Futūḥ al-buldān (The Origins of the Islamic State)*, 1916, 1924, tells of the wars and conquests of the Muslim Arabs from the time of the Prophet Muḥammad. It covers the conquests of lands from Arabia west to Egypt, North Africa, and Spain and east to Iraq, Iran, and Sind. Al-Balādhurī drew on oral history and on the few earlier biographies and campaign accounts, giving variants and authorities for them. His history, in turn, was much used by later writers. *Ansāb al-ashrāf* ("Lineage of the Nobles"), also extant, is a biographical work in genealogical order devoted to the Arab aristocracy, from Muḥammad and his contemporaries to the Umayyad and 'Abbāsid caliphs. It contains histories of the reigns of rulers.

Bālāghāt, town, administrative headquarters of Bālāghāt district, Madhya Pradesh state, central India, just east of the Wainganga River. A major road and rail junction, the town is an agricultural trade and manganese-mining centre. Sugar milling is important. The town has two colleges affiliated with the University of Saugar. Formerly called Burha, Bālāghāt was constituted a municipality in 1877.

Bālāghāt district has an area of 3,570 sq mi (9,245 sq km) and comprises a plateau of the Sātpura Range to the north and lowlands to the south. It is divided from the Chhattīsgarh Plain to the east by the Maikala Range. In the Wainganga Valley in the south and southwest, rich soil areas are extensive. Rice, millet, and pulses are the chief crops; cattle are raised on the plateau near Baihar. Manganese, bauxite, mica, copper, and red-ochre deposits are worked. Goḥḍ form one-third of the district's population. There is also a small community of Baiga tribesmen who are skilled woodsmen. Pop. (1991) town, 62,200; metropolitan area, 67,200; district, 1,362,731.

Bālāghāt Range, series of hills in western Mahārāshtra state, western India. Originating in the Western Ghāts at the Harishchandra Range, the range extends southeastward for about 200 miles (320 km) to the border of Mahārāshtra and Karnāṭaka states. Its width varies from 3 to 6 miles (5 to 9 km). Higher in the west, the Bālāghāt hills have elevations of 1,800–2,700 feet (550–825 m), gradually diminishing eastward until they end at the Bhīma River. The flat-topped hills are separated by saddles, which become progressively wider toward the east. The Bālāghāt range forms the watershed between the Godāvāri River to the north and the Bhīma to the south. In the rainier west the hills bear vegetation, but they are barren and stony in the east. Shepherds occupy the entire range, and sheep trails connect the small villages and occasional hilltop temples. Traversing the Bālāghāt are a highway from Pune (Poona) to Nāsik and the railway from Dhond to Manmād.

Balaguer (y Ricardo), Joaquín (Vidella) (b. Sept. 1, 1906, Villa Bisonó, Dominican Republic—d. July 14, 2002, Santo Domingo), lawyer, writer, and diplomat who was vice president of the Dominican Republic (1957–60) during the regime of President Hector Trujillo and was president from 1960 to 1962, 1966 to 1978, and 1986 to 1996.

Balaguer earned a law degree from the University of Santo Domingo and a Ph.D. from the University of Paris. Between 1932 and 1957, he held numerous executive and diplomatic posts in the Dominican government under the Trujillo regime. As secretary of education under Hector Trujillo, brother of dictator General Rafael Trujillo, he established free universities and expanded educational and library facilities. He was sworn in as president when Hector Trujillo resigned because of illness. As General Rafael Trujillo still effectively held all power, Balaguer, who was only the nominal president, could effect little real change or reform. After Rafael Trujillo's assassination in 1961, Balaguer tried to liberalize the government, and the Organization of American States (OAS) lifted the economic sanctions that had been imposed during Trujillo's dictatorship. But Balaguer's changes went too fast for the *trujillistas* and not fast enough for those who demanded the immediate restoration of civil liberties and a more equitable distribution of wealth. A short-lived military coup forced Balaguer to resign in 1962 and take refuge in the United States.

Balaguer returned to the Dominican Republic during the U.S. military intervention of 1965 and ran successfully for president in 1966. Having close ties to the business community, Balaguer achieved steady economic growth while implementing some modest social reforms. He was reelected to the presidency in 1970 and 1974, but these latter terms were marred by political violence, assassinations of government opponents, inflation, and alleged electoral fraud. Balaguer lost the 1978 presidential race (the first election since 1966 to allow the major opposition party to be represented) to Silvestre Antonio Guzmán. Balaguer also lost the presidential elections of 1982, but he regained the presidency in the 1986 elections and was reelected in 1990. He undertook an unprecedented public-works program, which included building roads, bridges, schools, housing projects, and libraries, but the costly projects seriously hampered the economy. In 1994 Balaguer again won the presidency, but, amid charges of electoral fraud and intense international pressure, he agreed to serve only two years of his term. He left office in 1996, and his bid for a seventh presidential term in 2000 was unsuccessful.

Balaguer's many books on Latin-American history, politics, and literature included *La realidad Dominicana* (1947; *Dominican Reality*)

and *Historia de la literatura Dominicana* (1955; "History of Dominican Literature").

Balaguer (i Cirera), Victor (b. Dec. 11, 1824, Barcelona, Spain—d. Jan. 14, 1901, Madrid), Catalan poet and Spanish politician and historian.

Balaguer was a precocious youth; his first dramatic essay, *Pépin el Jorobado; o, el hijo de Carlomagno* (1838; "Pepin the Hunchbacked; or, The Son of Charlemagne"), was staged in Barcelona when he was 14. At 19 he was publicly "crowned" after the production of his second play, *Don Enrique el Dabivoso* (1843; "Don Henry the Bountiful"); several other Romantic historical plays followed. From 1843 to 1868 he led the Liberal Party in Barcelona and promoted local patriotism in Catalonia.

In 1857 he wrote his first poem in Catalan and thereafter adopted the sometime pseudonym of Trovador de Monserrat ("Troubadour of Monserrat"); in 1861 he was proclaimed *mestre de gay saber* ("master of poetical knowledge"), in a revival of an honour given to medieval troubadours. He moved to Madrid to pursue a political life and, during the troubled times centring on the interrupted reign of Isabella II, was alternately in and out of favour of those in power; he finally put aside Catalan nationalism, took the side of the dynasty, and eventually rose to the position of senator in the Spanish legislature.

In his later years Balaguer sought to explain away the severe criticism of Castile that he had earlier expressed in his *Historia de Cataluña y de la Corona de Aragón* (1860–63; "History of Catalonia and of the Crown of Aragon"). This narrative, like his *Historia política y literaria de los trovadores* (1878–79; "Political and Literary History of the Troubadours"), was politically partial in favour of Catalan nationalism and was also often factually inaccurate. As a poet, Balaguer was reminiscent of Manuel José Quintana in his patriotic songs, of José Zorrilla y Moral in his historical ballads, and of Lord Byron in his lyrical poems.

Balakirev, Mily (Alekseyevich) (b. Jan. 2, 1837 [Dec. 21, 1836, Old Style], Nizhni Novgorod, Russia—d. May 29 [May 16], 1910, St. Petersburg), Russian composer of orchestral music, piano music, and songs. He was a dynamic leader of the Russian nationalist group of composers of his era.

Balakirev's early musical education was received from his mother. He also studied with John Field's pupil Alexander Dubuque and with Karl Eisrich, music director to A.D. Uli-bishev, who published well-known books on W.A. Mozart and Ludwig van Beethoven. At

Balakirev, portrait by Léon Bakst, c. 1900–10

Novosti Press Agency

15 Balakirev began to compose and rehearsed the local theatre orchestra. From 1853 to 1855 he studied mathematics at the University of Kazan and wrote, among other things, a piano concerto (completed 1856). He made his first appearance as a concert pianist in Kronshtadt in December 1855. Thereafter Balakirev made a number of appearances as a concert pianist, composed an *Overture on Russian Themes*

and music to *King Lear* (1858–61), and became the mentor of two young composers, César Cui and Modest Mussorgsky. In 1861 and 1862 his circle of disciples was joined by Nikolay Rimsky-Korsakov and Aleksandr Borodin, forming the group known as "The Five." In 1862 he joined the Free School of Music, opened by G.Y. Lomakin in opposition to the St. Petersburg Conservatory, and soon became principal concert conductor.

During the 1860s Balakirev was at the height of his influence. He collected folk songs up and down the Volga and introduced them in a *Second Overture on Russian Themes*, which ultimately became the symphonic poem *Russia*; he spent summer holidays in the Caucasus, gathering themes and inspiration for his brilliant piano fantasy *Islanley* (1869) and his symphonic poem *Tanara* (1867–82); he published the works of composer Mikhail Glinka and visited Prague to produce them; and for a time (1867–69) he conducted the symphony concerts of the Russian Music Society.

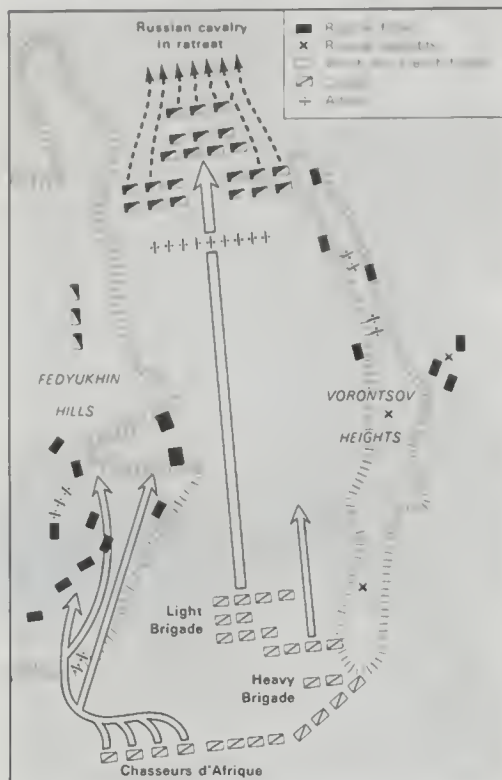

Balakirev's despotic nature and his tactlessness made him innumerable enemies, so that even his friends and young disciples came to resent his tutelage. A series of personal and artistic misfortunes led to his almost complete withdrawal from the world of music during 1872–76 and his taking a post as a railway clerk. Balakirev had passed through a period of acute depression 10 years earlier; now he underwent a more severe crisis from which he emerged a totally changed man, a bigoted and superstitious Orthodox Christian. He gradually returned to the music world, resumed directorship of the Free School, and from 1883 to 1894 was director of the imperial chapel. He also resumed musical composition, completing several works, including a symphony he had abandoned many years before, and writing new ones, among these his *Piano Sonata* (1905), a *Second Symphony* (1908), and a number of piano pieces and songs.

It has been said that it was Balakirev, even more than Glinka, who set the course for Russian orchestral music and lyrical song during the second half of the 19th century. He developed an idiom and technique that he imposed on his disciples (above all on Rimsky-Korsakov and Borodin, and to some extent on Peter Ilich Tchaikovsky) not only by example but by constant autocratic supervision of their own earlier works. His music is superbly colourful and imaginative, but his creative personality was arrested in its development after 1871, and his later work is couched in the idiom of his youth.

Balaklava, Battle of, Balaklava also spelled BALACLAVA (Oct. 25 [Oct. 13, Old Style], 1854), indecisive military engagement of the Crimean War, best known as the inspiration of the English poet Alfred, Lord Tennyson's "Charge of the Light Brigade." In this battle, the Russians failed to capture Balaklava, the Black Sea supply port of the British, French, and Turkish forces in the southern Crimea; but the British lost control of their best supply road connecting Balaklava with the heights above Sevastopol, the major Russian naval centre that was under siege.

Early in the battle the Russians occupied the Fedyukhin and the Vorontsov heights, bounding a valley near Balaklava, but they were prevented from taking the town by General Sir James Scarlett's Heavy Brigade and by Sir Colin Campbell's 93rd Highlanders, who beat off two Russian cavalry advances. Lord Raglan and his British staff, based on the heights above Sevastopol, however, observed the Russians removing guns from the captured artillery posts on the Vorontsov heights and sent orders to the Light Brigade to disrupt them. The final order became confused, how-

ever, and the brigade, led by Lord Cardigan, swept down the valley between the heights rather than toward the isolated Russians on the heights. The battle ended with the loss of 40 percent of the Light Brigade. Tennyson's "Charge of the Heavy Brigade at Balaklava,"

The charge of the Light Brigade at Balaklava

never popular, is unknown except to literary scholars.

Balakovo, city, Saratov *oblast* (province), southwestern Russia, on the left bank of the Volga River. Founded in 1762, it long remained a small agricultural town. Its growth was greatly stimulated by the construction in 1967–70 of the Saratov hydroelectric station on the Volga. Balakovo is also the site of construction of a nuclear power station. A major chemical industry, developed in the 1960s and expanded in the 1980s, produces cord for tires, sulfuric acid, superphosphates, and carbon bisulfide. Local industries also produce marine and stationary diesel engines, construction materials, and foodstuffs; the city has facilities for ship repair. Pop. (1991 est.) 202,100.

balalaika, Russian stringed musical instrument of the lute family. It was developed in the 18th century from the *dombra*, or *domra*, a round-bodied, long-necked, three-stringed lute played in Russia and Central Asia. The balalaika is made in six sizes, from piccolo to double bass, and has a flat back and a triangular table, or belly, that tapers to the fretted neck. The frets are movable, and there is a small, round sound hole in the narrow end of the belly. The three strings, usually gut, are end hitched and strung over a violin-like, or pressure, bridge. They are normally plucked with the fingers, although metal strings are also plucked with a leather plectrum.

The instrument was used in folk music but was also employed in large balalaika orchestras in the 20th century. The representative

size, called the prime, or treble, is usually tuned E-E-A in the octave above middle C.

balance, instrument for comparing the weights of two bodies, usually for scientific purposes, to determine the difference in mass.

The invention of the equal-arm balance dates back to the time of the ancient Egyptians, possibly as early as 5000 BC. In the earliest types, the beam was supported at the centre and the pans were hung from the ends by cords. A later improvement in design was the use of a pin through the centre of the beam for the central bearing, introduced by the Romans about the time of Christ. The invention of knife-edges in the 18th century led to the development of the modern mechanical balance. By the end of the 19th century the balance had been developed in Europe into one of the world's most precise types of measuring devices. In the 20th century, electronic balances were developed, depending on electrical compensation rather than mechanical deflection.

The mechanical balance consists, essentially, of a rigid beam that oscillates on a horizontal central knife-edge as a fulcrum and has the two end knife-edges parallel and equidistant from the centre. The loads to be weighed are supported on pans hung from bearings. For the best design, two or more additional knife-edges are located between the end bearing and the pan, one to prevent tilting of the plane and another to fix the centre of load at a particular point on the end knife-edge. An arresting mechanism prevents damage during loading by separating the knife-edges from their bearings. The deflection of the balance may be indicated by a pointer attached to the beam and passing over a graduated scale or by reflection from a mirror on the beam to a distant scale.

The most obvious method of using a balance is known as direct weighing. The material to be weighed is put on one pan, with sufficient known weights on the other pan such that the beam will be in equilibrium. The difference between the zero reading and the reading with the pans loaded indicates the difference between loads in scale divisions. Such a direct weighing requires that the arms be of equal length. When the error resulting from unequal arms is greater than the required precision, the substitution method of weighing may be used. In this method, counterpoise weights are added to one pan to balance the unknown load on the other. Then, known weights are substituted for the unknown load. This method requires only that the two arms of the beam

maintain the same lengths during the weighing. Any effect of inequality is the same for both loads and is therefore eliminated.

Small quartz microbalances with capacities of less than a gram have been constructed with a reliability much greater than is ordinarily found with small assay-type balances having a metal beam with three knife-edges. Microbalances are used chiefly to determine the densities of gases, particularly of gases obtainable only in small quantities. The balance usually operates in a gas-tight chamber, and a change in weight is measured by the change in the net buoyant force on the balance due to the gas in which the balance is suspended, the pressure of the gas being adjustable and measured by a mercury manometer connected with the balance case.

The ultramicrobalance is any weighing device that serves to determine the weight of smaller samples than can be weighed with the microbalance—*i.e.*, total amounts as small as one or a few micrograms. The principles on which ultramicrobalances have been successfully constructed include elasticity in structural elements, displacement in fluids, balancing by means of electrical and magnetic fields, and combinations of these. Measurement of the effects produced by the minute masses weighed has been made by optical, electrical, and nuclear radiation methods of determining displacements and by optical and electrical measurements of forces used to restore a displacement caused by the sample being weighed.

The success of traditional balances in modern times has relied on the elastic properties of certain suitable materials, especially quartz fibres, which have great strength and elasticity and are relatively independent of the effects of temperature, hysteresis, and inelastic bending. The most successful and practical ultramicrobalances have been based on the principle of balancing the load by applying torque to a quartz fibre. One simple design utilizes a rigid fibre as a horizontal beam, supported at its centre by a stretched horizontal quartz torsion fibre sealed to it at right angles. On each end of the beam a pan is suspended, one counterbalancing the other. The deflection of the beam caused by adding the sample to one pan

Rider analytical balance

From McGraw-Hill *Encyclopedia of Science and Technology*, Copyright (1971), used with permission of McGraw-Hill Book Co

is restored by rotating the end of the torsion fibre until the beam is again in its horizontal position and the full range of torsion in the suspending fibre can be applied to the mea-

surement of the load added to one pan. The amount of torsion necessary for restoration is read by means of a dial attached to the end of the torsion fibre. The weight is obtained by calibrating the balance against known weights and reading the value from the calibration chart of weight versus torsion. Unlike direct displacement balances that rely only on the elasticity of the structural members, the torsion balance allows gravity to balance the largest component of the load, *i.e.*, the pans, and results in greatly increased load capacity.

Balances of the late 20th century are usually electronic and far more accurate than mechanical balances. A scanner measures the displacement of the pan holding the object to be weighed and, by means of an amplifier and possibly a computer, causes a current to be generated that returns the pan to its zero position. Measurements are read on a digital screen or printout. Electronic weighing systems not only measure total mass but also may determine such characteristics as average weight and moisture content.

Balanchine, George, original name GEORGY MELITONOVICH BALANCHIVADZE (b. Jan. 22 [Jan. 9, old style], 1904, St. Petersburg, Russia—d. April 30, 1983, New York City), most influential choreographer of classical ballet in the United States in the 20th century. His works, characterized by a cool neoclassicism, include *The Nutcracker* (1954) and *Don Quixote* (1965), both pieces choreographed for the New York City Ballet, of which he was a founder (1948), the artistic director, and the chief choreographer. He was also a pioneer in choreography for the musical theatre and motion pictures.

The European years. Georgy Balanchivadze, a Georgian, was one of a generation of dancers who spent the World War I years at the Imperial School of Ballet at the Mariinsky Theatre. The theatre closed for some months in 1917, and, until the Imperial School reopened in 1918 as the Soviet State School of Ballet, he had to support himself with unskilled jobs or by playing piano in a cinema. After three more years of study, he was graduated. The son of a composer, he had also studied music at the Petrograd (St. Petersburg) Conservatory (1921–24).

As a student Balanchivadze had already tried choreography. His first work, as early as 1920, was a short piece danced to Anton Rubinstein's *Nuit*. He also choreographed works for evenings of experimental ballet performed by himself and his colleagues at the State School of Ballet. The school's directors discouraged this activity, however. He mounted some new and experimental ballets for the Mikhailovsky Theatre in Petrograd. Among them were *Le Boeuf sur le toit* (1920) by Jean Cocteau and Darius Milhaud and a scene for *Caesar and Cleopatra* by George Bernard Shaw.

Balanchivadze was one of the first ballet dancers to leave the Soviet Union, initially to tour with a small group, the Soviet State Dancers, which also included Aleksandra Danilova, Tamara Gevergeva (later Geva), and Nicolas Efimov. They toured Germany, London, and Paris, where in June 1925 he joined Sergey Diaghilev's Ballets Russes. (It was Diaghilev who at that time simplified Balanchivadze to Balanchine.)

It was as a choreographer that Diaghilev envisaged Balanchine—Bronislava Nijinska had recently left Diaghilev, and Balanchine assumed her duties—and in 1925 the Ballets Russes danced Balanchine's *Barabau*, the first of 10 ballets Balanchine was to mount for Diaghilev. Of the ballets he choreographed for Diaghilev, two survive notably in the world repertoire: *Apollo* (1928), the first example of his individual neoclassical style, and *Le Fils prodigue* (*The Prodigal Son*, 1929).

When Diaghilev died in 1929, Balanchine worked successively with the Royal Danish Ballet and with the Ballet Russe de Monte Carlo, adding significantly to his reputation by composing *La Concurrence* (1932) and *Cotillon* (1932). In 1933 he was one of the founders of the avant-garde company Les Ballets 1933, whose work so enormously impressed the American dance enthusiast Lincoln Kirstein that he invited Balanchine to organize the School of American Ballet and the American Ballet company (of which Kirstein was cofounder and director), thus beginning the association of "Mr. B.," as the ballet world knows him, and ballet in the United States.

Balanchine

The American years. The American Ballet became the resident ballet company at the Metropolitan Opera in New York City, and, while there, Balanchine produced among other works *Le Baiser de la fée* (1937; *The Fairy's Kiss*). He was also creative in a totally different sphere, as pioneer choreographer for Broadway musicals and Hollywood motion pictures, including the celebrated *Slaughter on Tenth Avenue* ballet in *On Your Toes* (1936).

The end of the largely unsatisfactory association between the American Ballet and the Metropolitan Opera came in 1938. Kirstein founded Ballet Caravan in 1936, with a repertoire of ballets by American choreographers. In 1941 this company and what remained of the American Ballet were united for a Latin-American tour, for which Balanchine composed *Concerto barocco* and *Ballet Imperial*. During the World War II period, Balanchine worked in the United States for the Original Ballet Russe, for Ballet Russe de Monte Carlo, and in Hollywood or on Broadway.

Kirstein was determined, however, to establish American ballet under Balanchine's artistic direction. In 1946 he founded the Ballet Society, which developed in 1948 into the New York City Ballet. First centred at the New York City Center and later at the New York State Theatre at Lincoln Center, this company became particularly identified with Balanchine. A prolific creator in various styles, he was responsible for most of the New York City Ballet's extensive repertoire, having created more than 150 works for the company. Among the works choreographed for the company were the full-length versions of *The Nutcracker* and *Don Quixote*.

In 1964 the American dance world was stirred when the Ford Foundation, having granted nearly \$8,000,000 to strengthen professional ballet in the United States, presented the entire amount to the New York City Ballet, its affiliated School of American Ballet, and six other ballet companies—all under the direct or indirect influence of Balanchine. He continued as artistic director and ballet master of the New York Ballet until late in 1982, when ill health forced him to relinquish his duties.

Although he worked mainly in the United States, Balanchine was an international choreographer, and almost every leading ballet company in the world has mounted at least one of his ballets. Best known abroad are his interpretations of musical compositions, either in a serious vein, such as Brahms' *Liebeslieder Walzer* (1960), or broadly comic, such as Hershy Kay's *Western Symphony* (1954), or richly Romantic, such as Robert Schumann's *Davidsbündlertänze* (1980).

Balanchine had a special artistic relationship with the composer Igor Stravinsky. Stravinsky's connection with the ballet started with Diaghilev, and Balanchine's first association with his music was in choreographing a new version of *Le Chant du rossignol* (*The Song of the Nightingale*) for the Ballet Russe in 1925. A long series of Stravinsky-Balanchine ballets followed; some of them were composed in collaboration. In 1972, a year after Stravinsky's death, the New York City Ballet staged a Stravinsky Festival. Ten years later, in 1982, a second Stravinsky Festival was held during the centenary of the composer's birth. Balanchine choreographed 4 of the 14 Stravinsky works performed. Other modern composers whose music Balanchine set to dance are Arnold Schoenberg (*Opus 34*) and Charles Ives (*Ivesiana*).

Balanchine studied his scores intensively as a preliminary to composition and began dance creation only at the first rehearsal. He said that his ideas came from working with his dancers, but he rarely discussed his ideas with them. He invented rapidly and without indulging in

fits of temperament. This approach, together with a predominating impression of cool intellectuality rather than warm emotion in the body of his work, established Balanchine, to an outside view, as a slightly remote and superhuman personality. The other side of the coin showed a man who enjoyed working with every kind of musical entertainment in the theatre and in motion pictures. (K.S.W.)

BIBLIOGRAPHY. An autobiographical chapter is contained in George Balanchine and Francis Mason, *Balanchine's Complete Stories of the Great Ballets*, rev. and enl. ed. (1977). See also Bernard Taper, *Balanchine*, rev. and updated ed. (1974), a full account of the man and his work; and Anatole Chujoy, *The New York City Ballet* (1953, reprinted 1981), an account of publications of Balanchine and his company.

Balanopales, order of dicotyledonous flowering plants comprising the family Balanopaceae, with a single genus (*Balanops*) and 12 species of trees and shrubs that have simple, alternately positioned or somewhat whorled leaves. The plants are further characterized by flowers that lack showy parts (sepals and petals). The male and female flowers occur on separate plants (*i.e.*, the plants are dioecious), the male in catkins (elongated, dangling clusters) and the female solitary. Each female flower consists of a single ovule-bearing structure (pistil) composed of two or three carpels, or structural units, and containing two or three imperfectly separated chambers (locules), each with two ovules. The upper part of the pistil is formed into two short processes (styles), each terminated by two long, tapering stigmas, or pollen-receptive surfaces. The pistil is seated in a basal whorl (involucre) of many overlapping, scalelike bracts forming a cupule that persists in the mature fruit, giving it an acorn-like appearance. The order is distributed mainly in New Caledonia, with populations occurring also in Vanuatu, Fiji, and limited tropical areas of Queensland, Australia. The order is an ancient group whose evolutionary position is controversial but thought to be closest to the beech order (Fagales); both are considered to have a common ancestor.

Balanophoraceae, the balanophora family of flowering plants, which includes about 18 genera containing more than 100 species of root parasites that are distributed primarily throughout the tropics. The Balanophoraceae are sometimes placed in their own order, Balanophorales, although they are usually considered to be members of the sandalwood order (Santalales). The club-shaped flower spikes of balanophora plants resemble fungi in their appearance and also in their emergence from the soil. The unisexual flowers range in colour from pale yellow to deep purple. The unlobed, scalelike leaves lack the chlorophyll necessary for food production, and thus the plants must obtain their nourishment by parasitizing other plants. Balanophoraceae species attach their tuberous rhizomes (underground stems)

Club-shaped flower spikes and scalelike leaves of *Balanophora fungosa* emerging from the floor of a rain forest near Gympie, Queensland, Australia

Cyril Webster/A N T Photo Library

to the roots of host trees by means of highly modified roots (haustoria), through which water and nutrients pass from host to parasite. Plants of the genera *Balanophora* and *Langsdorffia* contain an inflammable waxy material, and the stems have been used as candles in South America. The rhizomes of these plants are sometimes processed to produce wax, but the plants are not abundant enough for commercial wax production.

Balantidium, genus of ovoid protozoans of the holotrichous order Trichostomatida. Uniformly covered with longitudinal rows of minute, hairlike projections (cilia), *Balantidium* exists as a parasite in the intestines of pigs, apes, and other animals. The species *B. coli* can, in rare cases, infect humans and cause balantidiosis (balantidial dysentery), a relatively severe disease causing formation of intestinal ulcers. *Balantidium*, which feeds on red blood cells, cell fragments, and cell debris, is transmitted to new hosts by rounded cysts passed in excrement and subsequently ingested by a new host.

Balao, oil port, Esmeraldas province, north-western Ecuador, on the Pacific Ocean, adjacent to Esmeraldas city. Its development is entirely due to its choice as the terminus for the Trans-Ecuadorian Pipeline, built 1970-72 to exploit the rich petroleum deposits of Ecuador's Napo province, in El Oriente region, the tropical rain forest of the headwaters of the Amazon east of the Andes. Balao's terminal, opened August 1972, is the seaward end of the 313-mi (504-km) oil transportation system, one of the world's highest major pipelines, which crosses the Andes at a maximum elevation of over 13,300 ft (4,054 m).

The port accommodates 100,000-ton tankers, and special installations have been built to guard against pollution of Pacific waters from possible spillages. The port, pipeline, and oil fields were developed by local subsidiaries of Texaco, Inc. and Gulf Oil Corp., which were headquartered in the United States. By 1977 Ecuador owned the major share of its petroleum industry.

Balarāma, in Hindu mythology, the elder half-brother of Krishna, with whom he shared

Balarāma, bronze sculpture from Kurkihar, Bihar, early 9th century; in the Patna Museum, India

P. Chandra

many adventures. Sometimes Balarāma is considered one of the 10 avatars (incarnations) of the god Vishnu, particularly among those members of Vaiṣṇava sects who elevate Krishna to the rank of a principal god. Other legends identify him as the incarnation in human form of the serpent Śeṣa, and he may originally have been an agricultural deity. As early as the 2nd-1st century BC he is depicted holding a plowshare and a pestle with a snake canopy above his head and may be among the earliest Brahmanic gods to be given sculptural representation. In painting he is always shown with fair skin, in contrast to Krishna's blue complexion. The stories associated with him emphasize his love of wine and his enormous strength. He was rarely worshiped independently.

Balard, Antoine-Jérôme (b. Sept. 30, 1802, Montpellier, Fr.—d. March 30, 1876, Paris), French chemist who in 1826 discovered the

Balard

Boyer—H. Roger Violette

element bromine, determined its properties, and studied some of its compounds. Later he proved the presence of bromine in sea plants and animals.

In studying salt marsh flora from Mediterranean waters, Balard, after crystallizing sodium chloride and sodium sulfate from the seawater, saturating the residue with chlorine, and distilling the product, discovered the only liquid nonmetallic element, bromine.

An exponent of the potential value of the sea as a source of chemicals, Balard taught at Montpellier École de Pharmacie, from which he had graduated in 1826. He became professor of chemistry at the Sorbonne (1842) and at the Collège de France, Paris (1851).

balas ruby, variety of the gemstone ruby spinel (*q.v.*).

Balāsh, also spelled VALĀKHSĪ (fl. late 5th century), Sāsānian king (reigned 484-488), succeeding his brother Fīrūz I. Soon after he

Balāsh, coin, 5th century

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd

ascended the throne, Balāsh was threatened by the dominance of invading Hephthalites, a nomadic eastern tribe. Supported by Zarmihr, a feudal chief, Balāsh suppressed an uprising by his rebel brother Zareh. Later, however, he was abandoned by Zarmihr, and shortly afterward he was deposed and blinded. The crown was given to a son of Fīrūz, Kavadh I.

Balashikha, also spelled BALAŠICHA, city, Moscow *oblast* (province), western Russia, situated 15 miles (25 km) east of Moscow on the banks of the Pekhorka River. Balashikha developed in the 19th century, first as the site of a cloth factory and later as a centre for papermaking. In Soviet times it underwent rapid growth and was incorporated in 1939. The city is now a heavy-industrial centre, specializing in machine building. Balashikha's 19th-century townscape contrasts markedly with the newer sections. Pop. (1997 est.) 135,000.

Balasure, also called BĀLESHWAR, town, northeastern Orissa state, eastern India. Balasure lies on the Burhābalang River, 7 miles (11 km) from the Bay of Bengal. It was the site of a British settlement in 1633; Dutch, Danish, and French merchants followed later in the 17th century. The Dutch and Danish settlements were ceded to the British in 1846, but the French holding remained until 1947. In the 18th century Balasure became important in rice trading and the salt industry. Besides rice, the town now trades in fish, hardware, and other products; other economic activity includes rice milling, light manufacturing, fish curing, and weaving. It has several colleges affiliated with Utkal University. Good road and rail links exist to Calcutta and to other Orissa towns.

Balasure is situated on a strip of alluvial land on the Bay of Bengal. The principal crop of the region is rice, and fishing and weaving are important. Pop. (1991) 85,442.

Balassi, Bálint, Balassi also spelled BALASSA (b. Oct. 20, 1554, Zólyom, Hung.—d. May 30, 1594, Esztergom), the outstanding Hungarian lyric poet of his time, remaining uninvolved in his native literature until the end of the 18th century.

Balassi was born into one of the richest Protestant families of the country and lived an adventurous life, fighting against the Turks and against his own relatives, who sought to despoil him of his heritage. At first his poetry was conventional, but his powerful personality soon found original expression. He wrote vividly about the beauties of the countryside and the rough pleasures of warfare. His love poems show genuine feeling. Balassi was the inventor of a stanza form that was copied by later poets. His conversion to Roman Catholicism led to a religious poetry in which he exhibited a strong spirituality. He died of wounds received during the siege of Esztergom.

Balat (ancient city, Turkey): *see* Miletus.

balata, also called GUTTA BALATA, hard rubberlike material made by drying the milky juice produced principally by the bully tree (species *Manilkara bidentata*) of Guyana and the West Indies. The tree is tapped by cutting zigzag gashes in the bark and collecting the latex in cups, to be coagulated in trays. Like gutta-percha, balata is inelastic, tough, leathery, and water-resistant, and it softens when heated. It is often used as a substitute for the more expensive gutta-percha, chiefly in the manufacture of golf balls and machine belting.

Balaton, Lake, largest lake of central Europe, located in central Hungary about 50 miles (80 km) southwest of Budapest. It has an area of 231 square miles (598 square km) and extends for 48 miles (77 km) along the southern foothills of the Bakony Mountains of Hungary. At its widest point, Lake Balaton measures about 9 miles (14 km) across. Its maximum depth is 37 feet (11 m). The Zala River provides the largest inflow of water. Water outflow is through the sluice gates of Siófok, toward the eastern end of the lake, and the entire contents of the lake are replenished about every two years.

The bed of the Balaton is relatively young; it was formed at the end of the Pleistocene Epoch, less than 1,000,000 years ago. Originally, there were five small lakes that extended in a north-south chain, but these coalesced when erosion broke down the dividing ridges. Traces of these former lakes can still be seen in the configuration of Lake Balaton today, and the Tihany Peninsula—which projects from the northern shore, narrowing the lake to a width of 1 mile (1.6 km)—is the remnant of one of the dividing ridges.

The climate of the region is rather continental, with warm and sunny weather prevailing from May to October. In winter the lake is covered with a sheet of ice about 8 inches (20 cm) thick. As the prevailing winds are from the northwest, the southeastern shore of the lake is subject to erosion of its banks by wave action. Oscillations in the levels of the water surface known as seiches, the product of local variations of atmospheric pressure aided by currents in the water, increase the erosive effect. In the Tihany Narrows, the water currents flow with a speed of up to 5 feet (1.5 m) per second.

The chemical composition of the lake differs greatly from that of most central European lakes. The predominant anions, or negatively charged chemical components, are carbonate and sulphate, while the corresponding cations, or positive components, are magnesium, calcium, and sodium. Their interaction has given the lake its sulfo-carbonate character.

The regions around the lake are inhabited by a rich and interesting variety of plant and animal life. There is a wildlife reserve in the Tihany Peninsula, and another one in the extensive reedbeds near Keszthely, where rare water birds nest. The southern border of the lake is very fertile, and the volcanic soils to the northwest form the basis of a noted wine-growing region.

Agriculture nevertheless declined in significance as a result of the development of the tourist industry in the second half of the 20th century. A number of watering places sprang up, notable among which were Siófok, on the southern shore, and Balatonfüred, on the northern shore. The town of Balatonfüred was also traditionally known for its medicinal springs. The oldest and best-known settlement is Tihany, noted for its museum and biological station.

Balatonfüred, resort town, Veszprém *megye* (county), central Hungary, on the north shore of Lake Balaton. The town has been known for at least 250 years as a health spa and resort. In the town centre is Gyógy Tér ("Healing Square"), where the waters of volcanic springs rise up under a pavilion. There are 11 medicinal springs in the area that are said to have a stimulating effect on the heart and nerves. The foothills of the Bakony Mountains to the north protect the town from cold winds and help make the district one of the most celebrated wine-growing regions of Hungary. Pop. (2000 est.) 13,247.

Balbases, Ambrogio di Filippo Spinola, Marquess (Marqués) **de los**: *see* Spinola, Ambrogio di Filippo.

Balbinus, Decimus Caelius Calvinus (d. 238). Roman emperor in 238.

A patrician, Balbinus was a Salian priest, twice a consul, and proconsul in Asia. In 238, when the Senate led a rebellion of the Italian cities against Maximinus (emperor 235–238), it placed the government in the hands of a board of 20, one of whom was Balbinus, and then chose Balbinus and Pupienus Maximus to be joint emperors. Maximus, a former city prefect, was extremely unpopular with the people of Rome. When the enraged populace besieged the Senate and emperors in the Capitol, Balbinus and Maximus extricated themselves by appointing as caesar the young

Gordian, grandson of the original leader of the revolt.

Balbinus remained in Rome while Maximus advanced to defeat Maximinus. When Maximus returned, Balbinus, fearing his colleague intended to make himself sole ruler, quarreled

Balbinus, marble bust; in the Villa Albani, Rome

Alinari—Art Resource

with him. The Praetorian Guards in the city took advantage of the dispute to kidnap both emperors; the two were murdered as their captors tried to escape from the German guards. Gordian was thereupon proclaimed sole emperor.

Balbo, Cesare, Count (Conte) (b. Nov. 27, 1789, Turin, Piedmont [Italy]—d. June 3, 1853, Turin), Piedmontese political writer, a liberal but cautious constitutionalist who was influential during the Italian Risorgimento and served as the first prime minister of Sardinia-Piedmont under the constitution of March 5, 1848.

Balbo grew up while Piedmont was annexed to France and began his career by entering the Napoleonic bureaucracy, wherein he acquired a wide knowledge of Italy. When the house of Savoy was restored to the kingdom of Sardinia in 1814, Balbo's service to Napoleon was held against him; although he had little respect for the regime of Victor Emmanuel I and was friendly with liberals in Turin, he disapproved of revolution and remained loyal to the dynasty. Nevertheless, he fell into official disgrace because of his association with some leaders of the revolution in March 1821 and his attempt to persuade the future king Charles Albert to lead the constitutionalist movement. Balbo left Turin for several years and devoted himself to writing.

Balbo's most famous book, *Delle speranze d'Italia* (1844; "The Hopes of Italy"), showed the antirevolutionary nature of his patriotism and liberalism. He wrote that the independence of Italy from Austria was desirable, but Austria should be compensated with territory in the Balkans; that the interests of the papacy should be safeguarded; and that a confederation might be the best political organization for Italy. In *Lettere di politica e letteratura edite ed inedite* (1847), Balbo called for a specifically moderate Italian party.

Encouraged by Charles Albert's grant of the constitutional *statuto* in 1848, Balbo accepted the office of prime minister on March 13. Alarmed by the democratic agitation in Italy, he resigned in July 1848, later served as Piedmontese emissary to Pope Pius IX, and refused the premiership in 1852.

Balbo, Italo (b. June 6, 1896, near Ferrara, Italy—d. June 28, 1940, Tobruk, Libya), Italian airman and fascist leader who played a decisive role in developing Benito Mussolini's air force.

After studying at Florence University and the Institute of Social Science in Rome, Balbo

served as an officer in the Alpine Corps during World War I. An early Fascist, he led the Blackshirt militia in the March on Rome (October 1922). In rapid succession Mussolini made him a general of militia (1923), under-

Italo Balbo

secretary of state for air (1926), air minister (1929), and air marshal (1933).

Upgrading military as well as commercial aviation, Balbo became famous for his promotion of mass international flights to demonstrate Italy's air power. Though he was one of Fascism's best salesmen, his pro-British sentiment and his rising popularity among Italians may have caused Mussolini to remove him from the limelight by appointing him governor of Libya. Balbo was killed when his plane, it was stated, failed to give correct recognition signals and was shot down by Italian guns in Tobruk harbour.

Balboa, Pacific terminal port in Panamá province, central Panamá, at the southern end of the Panamá Canal. It lies between the canal docks and Ancón Hill, which separates it from Panamá City. Founded in 1914 and named for Vasco Núñez de Balboa, European discoverer of the Pacific, it has extensive harbour

Monument to George Washington Goethals, builder of the Panamá Canal, in Balboa, Panamá

installations, drydocks, marine and railroad repair shops, warehouses, and a coaling plant. Balboa is noted for its orchid gardens, with more than 400 orchid varieties.

The former Canal Zone (*q.v.*) was administered from Balboa Heights, on a hill overlooking Balboa. Pop. (2000 prelim.) district, 2,358.

Balboa, Vasco Núñez de (b. 1475, Jerez de los Caballeros, or Badajoz, Extremadura province, Castile—d. Jan. 12, 1519, Acla, near Darién, Panamá), Spanish conquistador and explorer, who was head of the first stable settlement on the South American continent (1511) and who was the first European to sight the Pacific Ocean (on Sept. 25 [or 27], 1513, from "a peak in Darién").

Career in the New World. Balboa came from the ranks of that lower nobility whose

sons—"men of good family who were not reared behind the plow," in the words of the chronicler Gonzalo Fernández de Oviedo y Valdés—often sought their fortunes in the Indies. In 1500 he sailed with Rodrigo de Bastidas on a voyage of exploration along the coast of present-day Colombia. Later, he settled in Hispaniola (Haiti), but he did not prosper as a pioneer farmer and had to escape his creditors by embarking as a stowaway on an expedition organized by Martín Fernández de Enciso (1510) to bring aid and reinforcements to a colony founded by Alonso de Ojeda on the coast of Urabá, in modern Colombia. The expedition found the survivors of the colony, led by Francisco Pizarro, but Ojeda had departed. On the advice of Balboa the settlers moved across the Gulf of Urabá to Darién, on the less hostile coast of the Isthmus of Panamá, where they founded the town of Santa María de la Antigua, the first stable settlement on the continent, and began to acquire gold by barter or war with the local Indians. The colonists soon deposed Enciso, Ojeda's second in command, and elected a town council; one of its two *alcaldes*, or magistrates, was Balboa. With the subsequent departure of Enciso for Hispaniola, Balboa became the undisputed head of the colony. In December 1511 King Ferdinand sent orders that named Balboa interim governor and captain general of Darién.

Balboa meanwhile had organized a series of gold- and slave-hunting expeditions into the Indian chiefdoms of the area. His Indian policy combined the use of barter, every kind of force, including torture, to extract information, and the tactic of divide and conquer by forming alliances with certain tribes against others. The Indians of Darién, less warlike than their neighbours of Urabá and without poisoned arrows, were not formidable foes and often fled at the approach of the Spaniards. The Spanish arsenal included their terrible war dogs, sometimes used by Balboa as executioners to tear Indian victims to pieces.

The Spaniards were told by Indians that to the south lay a sea and a province infinitely rich in gold—a reference to the Pacific and perhaps to the Inca Empire. The conquest of that land, their informants declared, would require 1,000 men. Balboa hastened to send emissaries to Spain to request reinforcements; the news they brought created much excitement, and a large expedition was promptly organized. But Balboa was not given command. Charges brought against him by his enemies had turned King Ferdinand II against him, and, as commander of the armada and governor of Darién, the King sent out the elderly, powerful nobleman Pedro Arias Dávila (usually called Pedrarias). The expedition, numbering 2,000 persons, left Spain in April 1514.

Discovery of the Pacific. Meanwhile, Balboa, without waiting for reinforcements, had sailed on Sept. 1, 1513, from Santa María for Acla, at the narrowest part of the isthmus. Accompanied by 190 Spaniards and hundreds of Indian carriers, he marched south across the isthmus through dense jungles, rivers, and swamps and ascended the cordillera; on Sept. 25 (or 27), 1513, standing "silent, upon a peak in Darién," he sighted the Pacific. Some days later he reached the shore of the Gulf of San Miguel and took possession of the Mar del Sur (South Sea) and the adjacent lands for the king of Castile. He then recrossed the isthmus, arriving at Santa María in January 1514. His letters and those of a royal agent who had been sent to Darién to prepare the ground for the coming of Pedrarias, announcing the discovery of the "South Sea," restored Balboa to royal favour; he was named *adelantado* (governor) of the Mar del Sur and of the provinces of Panamá and Coiba but remained subject to the authority of Pedrarias, who arrived in Darién, now a crown colony and renamed Castilla del Oro, in June 1514.

Relations between the two men were, from

the first, troubled by the distrust and jealousy of the ailing, ill-natured Pedrarias toward the younger man. The first bishop of Darién, Juan de Quevedo, sought to act as peacemaker and arranged a temporary reconciliation; in a turnabout Pedrarias by proxy betrothed his daughter María in Spain to Balboa. But the underlying causes of friction remained. The suspicious Pedrarias pursued a tortuous policy designed to frustrate Balboa at every turn; but he at last gave Balboa grudging permission to explore the South Sea. By dint of enormous efforts Balboa had a fleet of ships built and transported in pieces across the mountains to the Pacific shore, where he explored the Gulf of San Miguel (1517–18). Meantime, the stream of charges of misconduct and incapacity levelled against Pedrarias by Balboa and others had finally convinced the crown of Pedrarias' unfitness to govern; news arrived in Darién of his imminent replacement by a new governor who would subject Pedrarias to a *residencia* (judicial review of his conduct in office). Pedrarias doubtless feared that Balboa's presence and testimony would contribute to his total ruin and decided to get rid of his rival. Summoned home on the pretext that Pedrarias wished to discuss matters of common concern, Balboa was seized and charged with rebellion, high treason, and mistreatment of Indians, among other misdeeds. After a farcical trial presided over by Gaspar de Espinosa, Pedrarias' chief justice, Balboa was found guilty, condemned to death, and beheaded with four alleged accomplices in January 1519. (B.K.)

BIBLIOGRAPHY. The standard biography in English, well-documented and well-written, is Kathleen Romoli, *Balboa of Darién: Discoverer of the Pacific* (1953), which also contains an extensive bibliography of sources. There is a judicious survey of Balboa's career in Amando Melón y Ruiz de Gordejuela, *Los primeros tiempos de la colonización. Cuba y las Antillas. Magallanes y la primera vuelta del mundo* (1952). For a discussion of Balboa's route to the Pacific, see Angel Rubio, *La ruta de Balboa y el descubrimiento del Océano Pacífico* (1965). All modern accounts take as their points of departure the great chronicles of Pietro Martire d'Anghiera, *De orbe novo*, trans. by Francis A. MacNutt, 2 vol. (1912, reprinted 1970); Gonzalo Fernández de Oviedo y Valdés, *Historia general y natural de las Indias*, ed. by Juan Pérez de Tudela Bueso, 5 vol. (1959); and Bartolomé de las Casas, *Historia de las Indias*, ed. by Augustin Millares Carlo and preliminary study by Lewis Hanke, 2nd ed., 3 vol. (1965). See also C.L.G. Anderson, *Life and Letters of Vasco Núñez de Balboa* (1941).

Balbuena, Bernardo de (b. 1568, Valdepeñas, Spain—d. Oct. 11, 1627, San Juan, P.R.), poet and first bishop of Puerto Rico, whose poetic descriptions of the New World earned him an important position among the greatest poets of colonial America.

Balbuena, taken to Mexico as a child, studied there and in Spain. Returning to the New World, he held minor church offices in Jamaica (1608) and became bishop of Puerto Rico (1620), remaining there until his death.

Balbuena is best remembered for two epic poems, *La grandeza mexicana* (1604; "The Greatness of Mexico") and *El Bernardo o la victoria de Roncesvalles* (1624; "Bernardo; or, The Victory at Roncesvalles"), and for a collection of eclogues, *El siglo de oro en las selvas de Erifile* (1608; "The Golden Age in the Jungles of Erifile"). Much of his work was lost when his library was destroyed by the Dutch in the attack on San Juan in 1625.

Balbus, Lucius Cornelius (fl. 1st century BC), wealthy Roman, originally from Gades (modern Cádiz, Spain), who exerted influence on the major Roman political figures of the last years of the republic.

Gnaeus Pompey conferred Roman citizenship on Balbus and his family for his services against the rebel Quintus Sertorius in Spain.

Becoming friendly with all political parties in Rome, Balbus had the determining role in the formation of the "first triumvirate" (60) and was one of the city's chief financiers. He won the favour of Julius Caesar, accompanying the general as chief of staff to Spain (61) and Gaul (58). In 56, however, Balbus' enemies had him prosecuted for illegally assuming the rights of a Roman citizen, a charge directed as much against the "triumvirs" as against the defendant. With Cicero, Pompey, and Marcus Licinius Crassus speaking on his behalf, Balbus was acquitted. At the beginning of the Civil War (49–45) he attempted to persuade Cicero to mediate between Caesar and Pompey. Balbus then became Caesar's private secretary; he attached himself to Octavian after Caesar's murder in 44. He was consul—the first time for a provincial—in 40. Balbus published a diary, now lost, of the chief events of his life.

Balch, Emily Greene (b. Jan. 8, 1867, Jamaica Plain [now in Boston], Mass., U.S.—d. Jan. 9, 1961, Cambridge, Mass.), American sociologist, political scientist, economist, and pacifist, a leader of the women's movement for peace during and after World War I; she received the Nobel Prize for Peace in 1946 jointly with John Raleigh Mott. She was also noted for her sympathetic and thorough study of Slavic immigrants in the United States.

A member of the first graduating class at Bryn Mawr (Pennsylvania) College, she taught at Wellesley (Massachusetts) College from 1897. She founded a settlement house in Boston and served on the Massachusetts commissions on industrial relations (1908–09) and immigration (1913–14) and the Boston city

Emily Greene Balch

planning board (1914–17). To prepare *Our Slavic Fellow Citizens* (1910), she lived in Slavic-American neighbourhoods in various cities and traveled to eastern Europe for first-hand knowledge of the Slavic homelands.

A member of the Society of Friends (Quakers), she was a delegate to the International Congress of Women, The Hague (1915), and she helped found the Women's International League for Peace and Freedom, of which she was secretary-treasurer (1919–22, 1934–35). For opposing U.S. entry into World War I, she was dismissed from her professorship at Wellesley in 1918. Realizing the intractability of Nazi Germany and Japan, she approved U.S. participation in World War II. Her writings on peace include *Approaches to the Great Settlement* (1918).

Balchaš, Ozero (lake, Kazakhstan): see Balkhash, Lake.

Balcon, Sir Michael (b. May 19, 1896, Birmingham, Warwick, Eng.—d. Oct. 17, 1977, Hartfield, East Sussex), motion-picture producer, a leader in the British cinema industry.

He began his career as a producer in 1922, founded and directed Gainsborough Pictures, Ltd., in 1928, and became the director of production for Gaumont-British Pictures, Ltd., in 1931. From 1936 to 1938 he worked as pro-

ducer for Metro-Goldwyn-Mayer and from 1938 to 1959 as executive producer of Ealing Films, Ltd. In 1959 he became an independent producer. He was knighted in 1948.

Balcon, 1970

By courtesy of Sir Michael Balcon

Balcon believed that British films should be designed for a specific home market, as opposed to those who wanted to compete with Hollywood in the international market, resulting in Ealing's production of patriotic adventure films during World War II. After the war Balcon produced at Ealing a series of witty comedies (many of them starring Alec Guinness) reflecting the social conditions of post-war Britain, such as *Passport to Pimlico* (1949), *Kind Hearts and Coronets* (1949), and *The Lavender Hill Mob* (1951); they found an international audience.

balcony, external extension of an upper floor of a building, enclosed up to a height of about three feet (one metre) by a solid or pierced screen, by balusters (see also balustrade), or by railings. In the medieval and Renaissance periods, balconies were supported by corbels made out of successive courses of stonework or by large wooden or stone brackets. Since the 19th century, supports of cast iron, reinforced concrete, and other materials have become common.

In Islāmic countries the faithful are called to prayer from the top balcony of a minaret. In Japanese architecture, based on wooden structures, a balcony is provided around each, or part of each, story.

bald crow (bird): see rockfowl.

bald cypress, either of two species of ornamental and timber conifers constituting the genus *Taxodium* (family Taxodiaceae), native to swampy areas of southern North America. The name bald cypress, or swamp cypress, is used most frequently as the common name for *T. distichum*, economically the most important species.

A young bald cypress is symmetrical and pyramidal; as it matures, it develops a coarse, wide-spreading head. Its tapering trunk is usually 30 metres (about 100 feet) tall and one metre in diameter. The reddish-brown bark weathers to an ashy gray. An old tree is usually hollow and is known as pecky, or peggy, cypress in the lumber trade, because of small

Bald cypress (*Taxodium distichum*)

Alan Pitcam from Grant Heilman

holes in the wood caused by a fungus. A tree growing in wet soil is strongly buttressed about the base, and its horizontal roots often send conical, woody projections called "knees" above the waterline. The knees, thought to be air-obtaining organs and stabilizers for the submerged roots, are popular household ornaments.

The smaller pond, or upland, cypress of the southeastern U.S., a variety of the bald cypress, sometimes is considered to be a separate species (*T. ascendens*). It has erect branches and shorter, more scalelike leaves.

The closely related Montezuma or Mexican cypress (*T. mucronatum*) is native to the southwestern U.S., Mexico, and Guatemala. It is distinguished from the bald cypress by its shorter, persistent leaves and larger cones.

bald eagle (*Haliaeetus leucocephalus*), the only eagle solely native to North America, which is the national bird of the United States.

The bald eagle is actually a sea eagle (genus *Haliaeetus*) that commonly occurs inland along rivers and large lakes. The adult male is about 90 cm (36 inches) long and has a wingspan of 2 m (6.6 feet). Females, which grow somewhat larger than males, may reach 108 cm (43 inches) in length and have a wingspan of 2.5 m (8 feet). Both sexes are dark brown, with a white head and tail. The bird is not actually bald; its name derives from the conspicuous appearance of its white-feathered head. The beak, eyes, and feet are yellow.

The bald eagle's nest is a large platform of sticks built atop a large, isolated tree or pinnacle of rock located within easy flight of water. Nests are usually about 1.5 m (5 feet) wide, but old nests can be almost twice this size. The two or three eggs laid within take slightly longer than a month to hatch. Both parents share in the incubation and feeding of the young. The immature birds are brown with whitish tail and wing linings, but the pure white head and tail plumage do not appear until the birds are four to five years old.

Bald eagles pluck fish out of the water with their talons, and sometimes they follow seabirds as a means of locating fish. Bald eagles also rob ospreys of their fish. Besides live fish, bald eagles also prey on other birds, small mammals, snakes, turtles, and crabs, and they readily eat carrion.

Bald eagles may have numbered in the hundreds of thousands when they were declared the American national bird in 1782, but their numbers steadily declined over the next two centuries owing to human activities and persecution. The birds were hunted, both for sport and for bounties offered by state and federal governments, and because they were thought to menace livestock. In Alaska, where eagles perched on fish traps and scared away the salmon (an annoyance eventually overcome by fitting the traps with devices to discourage perching), Alaskan bounty hunters killed more than 100,000 eagles in the period 1917–52. The U.S. government's Bald Eagle Protection Act of 1940 made it illegal to kill bald eagles (Alaska was exempt), but the birds' numbers continued to decline, primarily because of the effects of the pesticide DDT, which came into widespread agricultural use after World War II. DDT accumulated in the bird's tissues and interfered with the formation of the eggshells; the thin, weak eggs were easily broken. By the early 1960s, the number of bald eagles in the coterminous United States had dropped to fewer than 450 nesting pairs.

In 1972 the use of DDT was banned in the United States, and in 1978 the U.S. government declared the bald eagle an endangered species in all but a few of the northernmost states. By the late 1980s, these measures had enabled the birds to replenish their numbers in

the wild. The bald eagle was reclassified from endangered to threatened status in 1995, by which time there were an estimated 4,500 nesting pairs in the lower 48 states. By 2000 the population had increased to more than 6,300 pairs.

Bald eagle (*Haliaeetus leucocephalus*)

Alexander Sprunt, IV

Some authorities distinguish two subspecies with ranges that partially overlap: the "southern" bald eagle (*H. leucocephalus leucocephalus*) inhabits most of the continental United States, its largest populations residing in Florida; the "northern" bald eagle (*H. leucocephalus alascanus*) inhabits the area from Maine to the Pacific Northwest and is widespread in Alaska and nearby regions of Canada.

Like all hawks and eagles, the bald eagle belongs to the family Accipitridae of the order Falconiformes. See also eagle.

baldachin, also spelled **BALDACHINO**, or **BALDAQUIN**, also called **CIBORIUM**, in architecture, the canopy over an altar or tomb, supported on columns, especially when freestanding and disconnected from any enclosing wall. The term originates from the Spanish *baldaquin*, an elaborately brocaded material imported from Baghdad that was hung as a canopy over an altar or doorway. Later it came to stand for a freestanding canopy over an altar.

Early examples of the baldachin are found in Ravenna and Rome. The characteristic form consists of four columns supporting entablatures, which carry miniature colonnades topped by a pyramidal or gabled roof. In Ro-

Baldachin, St. Peter's, Vatican City, by Gian Lorenzo Bernini, 1624-33

SCALA—Art Resource

manesque work, arches generally replaced the entablatures, and gables frequently topped the four sides, as is the case in the Church of San Ambrogio in Milan. Few baldachins of the Gothic period remain, and their use outside Italy seems to have been intermittent; there is, however, a rich Gothic example in the Sainte-Chapelle at Paris (1247-50), reconstructed by Eugène-Emmanuel Viollet-le-Duc in the 19th century. In the Renaissance the use of the baldachin became more common, and during the 17th century elaborate structures were built, probably as a result of the influence of the enormous bronze baldachin that Gian Lorenzo Bernini designed for the altar of St. Peter's in Rome.

Balder, Old Norse **BALDR**, in Norse mythology, the son of the chief god Odin and his wife Frigg. Beautiful and just, he was the favourite of the gods. Most legends about him concern his death. Icelandic stories tell how the gods amused themselves by throwing objects at him, knowing that he was immune from harm. The blind god Höd, deceived by the evil Loki, killed Balder by hurling mistletoe, the only thing that could hurt him. After Balder's funeral, the giantess Thökk, probably Loki in disguise, refused to weep the tears that would release Balder from death.

Some scholars believe that the passive, suffering figure of Balder was influenced by that of Christ. The Danish historian Saxo Grammaticus (c. 1200), however, depicts him as a warrior engaged in a feud over the hand of a woman.

baldness, also called **ALOPECIA**, the lack or loss of hair. Two primary types of baldness can be distinguished: permanent hair loss arising from the destruction of hair follicles, and temporary hair loss arising from transitory damage to the follicles. The first category is dominated by male-pattern baldness, which occurs to some degree in as much as 40 percent of some male populations. The hair loss in male-pattern baldness progresses gradually, beginning with a characteristic recession of the hairline at the front or thinning of the crown hair and proceeding, in extreme cases, until only a thin rim of hair remains at the sides and back of the head (the "Hippocratic wreath").

Male-pattern baldness has a hereditary basis; it varies in degree and seems to be caused by imbalances in the level of male hormones (testosterone and androgens) circulating in the blood. Male-pattern baldness is usually seen in persons with comparatively heavy body and facial hair and is common among people of European descent and of indigenous Australian descent. In the latter it is often accompanied by balding of the calves of the legs. It is rare among Asians, American Indians, and Africans. Other causes of permanent baldness include many scar-producing skin diseases and injuries, inborn lack of hair development, and severe injury to hair follicles by chemical or physical agents.

A temporary loss of hair occurs fairly commonly after conditions accompanied by high fever but may also be produced by X rays, ingestion of metals (such as thallium, tin, and arsenic) or drugs, malnutrition, some inflammatory skin diseases, chronic wasting diseases, and endocrine disorders. Alopecia areata, a fairly common disorder of unknown cause characterized by sharply outlined patches of sudden complete baldness, is also usually temporary.

There are two medical treatments for male-pattern baldness. The first, hair transplantation, involves the transplanting of hair follicles from areas of the scalp where hair is still growing to areas where it is not—e.g., from the back to the front of the head. The second treatment consists of the topical application of drugs. One drug, minoxidil, when applied to the scalp on a daily basis, is thought to be ef-

fective in preventing further hair loss in many cases and in growing new hair on bald or thinning areas in a much smaller proportion of cases.

Baldovinetti, Alesso, Alesso also spelled **ALESSIO** (b. Oct. 14, 1425?, Florence [Italy]—d. Aug. 29, 1499, Florence), painter whose work, though seldom innovative, exemplified the careful modeling of form and the accurate depiction of light characteristic of the most progressive style of Florentine painting during the last half of the 15th century. At the same time, he contributed importantly to the fledgling art of landscape painting.

Baldovinetti is presumed to have been an assistant to Domenico Veneziano, whose influence is reflected in the clear, pervasive light of

"Madonna and Child," oil on canvas by Alesso Baldovinetti, c. 1465; in the Louvre, Paris

Giraudon—Art Resource

his earliest surviving works: "The Baptism of Christ," "Marriage at Cana," and "The Transfiguration" (Museo di San Marco, or Museo dell'Angelico, Florence). He achieved his fully mature style in his masterpiece, "The Nativity" (1460-62), a fresco in the Church of SS. Annunziata, Florence. Although Baldovinetti's technical experiments led to the fresco's rapid decay, it shows the pale colours, atmospheric light, and integration of detail with large-scale design that characterized most of his later works, such as "Madonna and Child" (c. 1465; Louvre, Paris). Both "The Nativity" and "Madonna" include views of the Arno River valley and are among Europe's earliest paintings of actual landscapes.

Baldovinetti also did two strips of mosaic decoration over Lorenzo Ghiberti's doors on the Baptistery in Florence (1453-55) and a St. John the Baptist over the south doorway of Pisa Cathedral (1462). He also prepared designs for intarsias, or wood inlays, and for stained glass.

baldpate, popular North American game duck, also known as the American wigeon. See wigeon.

Baldung-Grien, Hans (b. c. 1484, Schwäbisch Gmünd, Württemberg [Germany]—d. 1545, Imperial Free City of Strasbourg [now Strasbourg, Fr.]), painter and graphic artist, one of the most outstanding figures in northern Renaissance art. He served as an assistant to Albrecht Dürer, whose influence

is apparent in his early works, although the demonic energy of his later style is closer to that of Matthias Grünewald.

His work is extensive and varied. It ranges from religious paintings and secular portraits to designs for tapestries and stained glass. He is noted for representations of the Virgin Mary, in which he combined landscapes, figures, light, and colour with an almost magical serenity. His portrayals of age, on the other hand, have a sinister character and a mannered virtuosity. His best known work in painting is the High Altar of the cathedral at Freiburg im Breisgau, Ger., for which he also designed the stained-glass choir windows.

Baldung-Grien's paintings are equalled in importance by his extensive body of drawings, engravings, and woodcuts of an intense vitality. The *Todentanz* ("dance of death") and the "death and the maiden" theme occur frequently in his graphic works. An early supporter of the Reformation, he executed a woodcut in which Martin Luther is protected by the Holy Spirit in the form of a dove.

Baldung-Grien was a member of the Strasbourg town council, as well as official painter to the episcopate. His works also appear in the church at Elzach and the museums of Basel, Karlsruhe, Cologne, Freiburg, and Nürnberg.

BELGIUM

● **Baldwin I:** see Baudouin I.

CONSTANTINOPLE

● **Baldwin I** (b. 1172—d. 1205), count of Flanders (as Baldwin IX) and of Hainaut (as Baldwin VI), a leader of the Fourth Crusade, who became the first Latin emperor of Constantinople.

The son of Baldwin V, count of Hainaut, and Margaret of Alsace, countess of Flanders, he was an ally of the English royal house of the Plantagenets, fighting at the side of Richard I against Philip II Augustus of France. During the Fourth Crusade, which was conceived by Pope Innocent III in 1198 and was fought not against the Muslims but against the Byzantine Christians, he took part in the capture of Constantinople and the installation of the pro-Latin Alexius IV Angelus as emperor in 1203; after Alexius and his father, Isaac II, were deposed in February 1204, the crusaders and their Venetian allies seized power, and Baldwin, with Venetian support, was chosen as ruler of a new Latin state. He was crowned emperor on May 16, 1204, in the church of the Hagia Sophia. The Pope, although initially shocked at the crusaders' pillage of Constantinople and disconcerted by their failure to consult him on the partition of the empire, quickly recognized the Latin emperor.

Baldwin created a new government, based on the western European feudal model, to replace the traditional hierarchy of the Byzantine Empire. In October 1204 he enfeoffed 600 knights with lands formerly held by Greek nobles.

A Byzantine revolt in Thrace provided the Bulgarian tsar Kaloyan with a pretext for invasion. Baldwin led a small force to confront him at Adrianople in March 1205. Defeated, taken prisoner, and executed by the Bulgars, he was succeeded by his brother Henry.

● **Baldwin II PORPHYROGENITUS** (Born to the Purple), byname BALDWIN OF COURTENAY, French BAUDOIN PORPHYROGÉNÈTE, or BAUDOIN DE COURTENAY (b. 1217, Constantinople—d. October 1273, Foggia, Kingdom of Sicily), the last Latin emperor of Constantinople, who lost his throne in 1261 when Michael VIII Palaeologus restored Greek rule to the capital.

The son of Yolande, sister of Baldwin I, the first Latin emperor of Constantinople, and Peter of Courtenay, the third Latin emperor, he came to the throne after the death of his brother Robert, the fourth emperor, in 1228. In his minority the regency was entrusted to John of Brienne, the titular king of Jerusalem. During this time, invasions by the Greeks under the emperor John III Ducas Vatatzes at Nicaea and by the Bulgars under Tsar John Asen II substantially reduced the territory of the empire, leaving only the area around Constantinople to the Latins. In 1236 and 1245 Baldwin went to western Europe to solicit funds and military aid; his treasury was empty, and he was forced to break up parts of the imperial palace for firewood. He sold a large number of alleged relics that had been kept at Constantinople, including Jesus' crown of thorns and a large portion of the True Cross, to the French king Louis IX, who placed them in the Sainte-Chapelle in Paris. When Michael VIII Palaeologus captured Constantinople on July 25, 1261, Baldwin fled through Greece to Italy and France. In May 1267 he persuaded Charles of Anjou, king of Naples and Sicily, to pension him and sign a treaty for the reconquest of the empire; in October 1273 he married his son Philip to Charles's daughter Beatrice. Nothing came of this alliance, however, for Baldwin died a few days later.

FLANDERS

● **Baldwin I**, byname BALDWIN IRON-ARM, French BAUDOIN BRAS-DE-FER, Dutch BOUDEWIJN DE IJZERE ARM (d. 879), the first ruler of Flanders. A daring warrior under Charles II the Bald of France, he fell in love with the King's daughter Judith, the youthful widow of two English kings, married her (862), and fled with his bride to Lorraine. Charles, though at first angry, was at last conciliated, and made his son-in-law margrave (*Marchio Flandriae*) of Flanders (864), which he held as a hereditary fief. The Norsemen were at this time continually devastating the coastlands, and Baldwin was entrusted with this outlying borderland in order to defend it. He was the first of a line of strong rulers, who early in the 10th century exchanged the title of margrave for that of count.

● **Baldwin II**, byname BALDWIN THE BALD, French BAUDOIN LE CHAUVÉ, Dutch BOUDEWIJN DE KALE (d. 918), second ruler of Flanders, who, from his stronghold at Bruges, maintained, as his father Baldwin I before him, a vigorous defense of his lands against the incursions of the Norsemen. On his mother's side a descendant of Charlemagne, he strengthened the dynastic importance of his family by marrying Aelfthryth, daughter of Alfred the Great, of Wessex, Eng.

● **Baldwin IV**, byname BALDWIN THE BEARDED, French BAUDOIN LE BARBU, Dutch BOUDEWIJN DE SCHONE BAARD (b. c. 980—d. May 30, 1035), count of Flanders (988–1035) who greatly expanded the Flemish dominions. He fought successfully both against the Capetian king of France, Robert II, and the Holy Roman emperor Henry II. Henry found himself obliged to grant to Baldwin IV in fief Valenciennes, the burgraveship of Ghent, the land of Waes, and Zeeland. The count of Flanders thus became a feudatory of the empire as well as of the French crown. The French fiefs are known in Flemish history as Crown Flanders (*Kroon-Vlaanderen*), the German fiefs as Imperial Flanders (*Rijks-Vlaanderen*). Baldwin's son—afterwards Baldwin V—rebelled in 1028 against his father at the instigation of his wife Adela, daughter of Robert II of France; but two years later peace was sworn at Oudenaarde, and the old count continued to reign until his death.

● **Baldwin V**, also called BALDWIN OF LILLE, French BAUDOIN DE LILLE, Dutch

BOUDEWIJN VAN RIJSEL (d. Sept. 1, 1067), count of Flanders who became one of the most influential figures of 11th-century Europe. He was an active, enterprising man and greatly extended his power by wars and alliances. He obtained from the Holy Roman emperor Henry IV the territory between the Scheldt and the Dender as an imperial fief, as well as the margravate of Antwerp. So powerful had he become that on the decease of Henry I of France he was appointed regent during the minority of Philip I (1060–66). Before his death he saw his eldest daughter Matilda (d. 1083) sharing the English throne with William the Conqueror; saw his eldest son, Baldwin of Mons, in possession of Hainaut in right of his wife Richilde, heiress of Regnier V (d. 1036); and saw his second son, Robert the Frisian, regent (*voogd*) of the county of Holland.

● **Baldwin IX:** see Baldwin I under Baldwin (Constantinople).

HAINAUT

● **Baldwin VI:** see Baldwin I under Baldwin (Constantinople).

JERUSALEM

● **Baldwin I**, byname BALDWIN OF BOULOGNE, French BAUDOIN DE BOULOGNE (b. 1058?—d. April 2, 1118, al-'Arish, Egypt), king of the crusader state of Jerusalem (1100–18), who expanded the kingdom and secured its territory, formulating an administrative apparatus that was to serve for 200 years as the basis for Frankish rule in Syria and Palestine.

Son of Eustace II, count of Boulogne, and Ida d'Ardenne, Baldwin was the younger brother of Godfrey of Bouillon (*q.v.*), whom he accompanied on the First Crusade (1096–99). While Baldwin was campaigning against the Seljuq Turks in Anatolia, Toros, the Christian prince of Edessa (Urfa, Tur.), promised to make him his heir in return for military aid. Baldwin forced Toros to abdicate and took possession of Edessa in 1098. He consolidated his new principality and strengthened its ties with the native Armenians by marrying Arda, the daughter of an Armenian noble.

In July 1100 his brother Godfrey died in Jerusalem, and Baldwin was summoned by the nobles to succeed him as *Advocatus Sancti Sepulchri* (Defender of the Holy Sepulchre). After leading a campaign in the south to impress the Egyptian Fatimids with his strength, and after subduing the opposition of the crusader nobles, he was crowned king of Jerusalem in December.

Once he had consolidated his strength at home, Baldwin seized the coastal cities of Arsuf (Tel Arshaf, Israel) and Caesarea (Ḥorbat Qesari, Israel) in 1101; by 1112 he had captured all the coastal cities except Ascalon and Tyre. In 1115 he built the castle of Krak de Montréal to protect the kingdom in the south.

In 1113 Baldwin forced his wife to enter a convent and married Adelaide of Saona, countess dowager of Sicily. He died without an heir and was succeeded by Baldwin du Bourg, a cousin whom he had named count of Edessa in 1100.

● **Baldwin II**, byname BALDWIN OF BOURG, French BAUDOIN DU BOURG (d. August 1131, Jerusalem), count of Edessa (1100–18), king of Jerusalem (1118–31), and crusade leader whose support of the religious-military orders founded during his reign enabled him to expand his kingdom and to withstand the attacks of Seljuq Turks.

A son of Hugh, count of Réthel, in the Ardennes region of France, he held the castle of Bourg as a feudal domain and was at first referred to as Baldwin du Bourg. He accompanied his cousins Godfrey of Bouillon and

Baldwin (later King Baldwin I of Jerusalem) to Palestine with the First Crusade (1096). In 1100 he was named count of Edessa (now Urfa, Tur.) by Baldwin I when the latter became king of Jerusalem. The Seljuq Turks moved against Edessa in 1104, capturing Baldwin on May 7. Ransomed in 1108, he fought his way into Edessa to reclaim his principality from the regent, Tancred, and later recovered most of the lost territory.

On April 14, 1118, Baldwin was crowned king of Jerusalem. Though captured by the Turks and held hostage from 1123 until 1124, in subsequent years he succeeded in expanding his territory and directing attacks against Muslim Damascus with the aid of the Hospitalers and the Templars, crusading religious-military orders. Having had only daughters from his Armenian wife, Morfia, Baldwin gave his daughter Melisend in marriage to Fulk V, count of Anjou and Maine, in 1129 and named them as his successors.

• **Baldwin III** (b. 1131—d. Feb. 10, 1162, Beirut), king of the crusader state of Jerusalem (1143–62), military leader whose reputation among his contemporaries earned him the title of "ideal king."

Son of King Fulk of Jerusalem (reigned 1131–43) and of Melisend, the daughter of Fulk's predecessor, Baldwin II, Baldwin and his mother were coreulers from 1143 to 1151. During the period of their joint rule, the Latin colonies in Palestine were strengthened by the Second Crusade from the West (1147).

In 1151 Baldwin, following his assumption of sole rule, had to suppress a civil war that broke out between his supporters and those of his mother. He intervened frequently in the affairs of the Christian states of Tripoli and Antioch and captured Ascalon from the Egyptian Fātimids in August 1153, but he failed to prevent the capture of Damascus by the Muslim leader Nureddin the following year.

In 1158 Baldwin married Theodora Comnenus, niece of the Byzantine emperor Manuel I Comnenus. He and Manuel planned a joint attack against Nureddin, but it failed to materialize.

Baldwin III was highly respected by his contemporaries. Well-educated, he imposed his authority on his barons without resorting to force, and he avoided imposing oppressive taxes. His qualities gained him the love of his subjects and the esteem of his enemy Nureddin.

• **Baldwin IV**, byname **BALDWIN THE LEPER**, French **BAUDOIN LE LÉPREUX** (b. 1161—d. March 1185, Jerusalem), king of Jerusalem (1174–85), called the "leper king" for the disease that afflicted him for most of his short life. His reign saw the growth of factionalism among the Latin nobility that weakened the kingdom during the years when its greatest adversary, the Muslim leader Saladin, extended his influence from Egypt to Syria.

Educated by William, archdeacon of Tyre, Baldwin was crowned four days after his father died. Too young at age 13 to rule the kingdom, he was assisted by his kinsman Raymond III, count of Tripoli, who acted as his regent until 1177. Baldwin's health steadily deteriorated, requiring periodic appointment of other regents and contributing to power struggles among the nobility.

In November 1177 Saladin marched from Egypt to attack Ascalon, and Baldwin rushed to the aid of the city. Trapped within its fortifications, he broke out and defeated Saladin near Mont Gisard. A two-year truce was arranged in 1180, but soon after it expired Saladin captured Aleppo (June 1183), thus completing the encirclement of Jerusalem.

In an attempt to keep the succession to the throne in his family, the childless Bald-

win crowned his nephew king as Baldwin V in November 1183, naming Raymond of Tripoli and Jocelin III of Courtenay the boy's guardians.

• **Baldwin V** (b. 1177, Jerusalem—d. August 1186, Acre), nominal king of Jerusalem who reigned from March 1185 until his death a year and a half later.

The son of William of Montferrat and Sybil, the sister of King Baldwin IV, Baldwin V came to the throne when his uncle died of leprosy at the age of 24. The able knight Raymond III, count of Tripoli, acted as regent for the young king, managing to obtain with Saladin, in 1185, a four-year truce that gave the kingdom of Jerusalem a much-needed respite from Muslim attacks. Upon his death, Baldwin was succeeded by Guy de Lusignan, Sybil's second husband.

• **Baldwin, Frank Stephen** (b. April 10, 1838, New Hartford, Conn., U.S.—d. April 8, 1925, Denville, N.J.), inventor best-known for his development of the Monroe calculator.

His first calculator, the arithmometer (patented 1875), could add, subtract, multiply, and divide. Economic conditions, however, prevented its immediate manufacture. The Baldwin computing engine (1890) was followed by the Baldwin calculator (1902), but not until 1912 (patent date, 1913), in association with Jay Monroe, did he perfect the Monroe calculator. He remained research director of the Monroe Calculating Machine Company until his death.

• **Baldwin, Henry** (b. Jan. 14, 1780, New Haven, Conn., U.S.—d. April 21, 1844, Philadelphia), associate justice of the United States Supreme Court (1830–44).

Baldwin graduated with honours from Yale University in 1797 and studied law, subsequently opening his practice in Pittsburgh. He was elected to the first of three terms to the U.S. House of Representatives in 1816. He was a supporter of protective tariffs and played a leading role in Florida treaty negotiations before ill health forced him to resign in 1822.

An ardent supporter of President Andrew Jackson, he hoped to be named secretary of the treasury but was instead appointed to the U.S. Supreme Court. Initially, his respect for Chief Justice John Marshall allied him to the liberal interpreters of the Constitution, but he gradually moved to a middle ground. He attempted to put his judicial principles in a systematic framework in *A General View of the Origin and Nature of the Constitution and Government of the United States* (1837), but his decisions on the Court were unpredictable. His most important opinion was handed down in the Florida Land Case, *United States v. Arredondo* (1832), which made strict adherence to treaties a basic element of public land policy.

• **Baldwin, James (Arthur)** (b. Aug. 2, 1924, New York City—d. Dec. 1, 1987, Saint-Paul, Fr.), American essayist, novelist, and playwright whose eloquence and passion on the subject of race in America made him an important voice, particularly in the late 1950s and early 1960s, in the United States and, later, through much of western Europe.

The eldest of nine children, he grew up in poverty in the black ghetto of Harlem in New York City. From 14 to 16 he was active during out-of-school hours as a preacher in a small revivalist church, a period he wrote about in his semiautobiographical first and finest novel, *Go Tell It on the Mountain* (1953), and in his play about a woman evangelist, *The Amen Corner* (performed in New York City, 1965).

James Baldwin
UPI—EB Inc

After graduation from high school, he began a restless period of ill-paid jobs, self-study, and literary apprenticeship in Greenwich Village, the bohemian quarter of New York City. He left in 1948 for Paris, where he lived for the next eight years. (In later years, from 1969, he became a self-styled "transatlantic commuter," living alternatively in the south of France and in New York and New England.) His second novel, *Giovanni's Room* (1956), deals with the white world and concerns an American in Paris torn between his love for a man and his love for a woman. Between the two novels came a collection of essays, *Notes of a Native Son* (1955).

In 1957 he returned to the United States and became an active participant in the civil-rights struggle that swept the nation. His book of essays, *Nobody Knows My Name* (1961), explores black-white relations in the United States. This theme was central to his novel *Another Country* (1962), which examines sexual as well as racial issues.

The New Yorker magazine gave over almost all of its Nov. 17, 1962, issue to a long article by Baldwin on the Black Muslim separatist movement and other aspects of the civil-rights struggle. The article became a best-seller in book form as *The Fire Next Time* (1963). His bitter play about racist oppression, *Blues for Mister Charlie* ("Mister Charlie" being a black term for a white man), played on Broadway to mixed reviews in 1964.

Though Baldwin continued to write until his death—publishing works including *Going to Meet the Man* (1965), a collection of short stories; and the novels *Tell Me How Long the Train's Been Gone* (1968), *If Beale Street Could Talk* (1974), and *Just Above My Head* (1979); and *The Price of the Ticket* (1985), a collection of autobiographical writings—none of his later works achieved the popular and critical success of his early work.

• **Baldwin, James Mark** (b. Jan. 12, 1861, Columbia, S.C., U.S.—d. Nov. 8, 1934, Paris), philosopher and theoretical psychologist who exerted influence on American psychology during its formative period in the 1890s. Concerned with the relation of Darwinian evolution to psychology, he favoured the study of individual differences, stressed the importance of theory for psychology, and was critical of narrow experimentalism.

During a year of study in Berlin and at the University of Leipzig (1884–85), Baldwin became acquainted with the new experimental psychology and its founder, Wilhelm Wundt. To answer the need for English textbooks in the new psychology, he wrote a *Handbook of Psychology*, 2 vol. (1889–91). In 1889 he became professor of philosophy at the University of Toronto, where he established a psychological laboratory. Later, as professor of psychology and philosophy at Princeton University

(1893–1903), where he established another laboratory, he published two works advancing evolutionary principles in psychology, *Mental Development in the Child and the Race* (1895) and *Social and Ethical Interpretations in Mental Development* (1897). With James McKeen Cattell, he founded the *Psychological Review* (1894), from which other publications also developed, including the *Psychological Index* and the *Psychological Bulletin*.

Baldwin edited the contributions of some 60 philosophers and psychologists in his *Dictionary of Philosophy and Psychology*, 3 vol. (1901–05), the final volume of which was a 1,200-page bibliography by Benjamin Rand. Associated with Johns Hopkins University, Baltimore (1903–09), he then spent five years in Mexico City as an adviser to the National University of Mexico. During this period he completed *Genetic Logic*, 3 vol. (1906–11), which examined the nature and development of thought and meaning. Settling in Paris (1913), he lectured at various provincial universities and in 1919 became professor at the *École des Hautes Études Sociales* in Paris.

Baldwin, Matthias William (b. Dec. 10, 1795, Elizabethtown, N.J., U.S.—d. Sept. 7, 1866, Philadelphia, Pa.), manufacturer whose significant improvements of the steam locomotive included a steam-tight metal joint that permitted his engines to use steam at double the pressure of others.

Originally trained as a jeweler but experienced in industrial design and manufacture, Baldwin was approached in 1832 by the Philadelphia and Germantown Railroad, which needed a locomotive. The commission proved to be the start of the Baldwin Locomotive Works. During its founder's lifetime, the plant built more than 1,500 locomotives.

Among Baldwin's philanthropies was education for black children. His abolitionist sympathies led to a Southern boycott of his engines shortly before the American Civil War.

Baldwin, Robert (b. May 12, 1804, York, Upper Canada [now in Ontario, Can.]—d. Dec. 9, 1858, Toronto), statesman who was joint leader with Louis Hippolyte LaFontaine of the first and second Liberal administrations in Canada, which established the principle of responsible, or cabinet, government in Canada.

Called to the bar in 1825, Baldwin began his political career as a member (1829–30) of the Legislative Assembly of Upper Canada for York. In 1836 he served briefly on the Executive Council of Upper Canada and supported the union of Canada, condemning the Rebellion of 1837. He served (1840) on the Executive Council under Charles Poulett Thomson (later Baron Sydenham) but resigned, joining the opposition. In 1842, under the governor-generalship of Sir Charles Bagot, Baldwin and LaFontaine formed a Liberal administration and held office until Bagot's successor, Sir Charles Metcalfe, caused several ministers to resign. In the 1843 election the governor-generalship was narrowly sustained, but in 1848 the Liberals were returned to power. Under James Bruce, 8th Earl of Elgin, Baldwin and LaFontaine saw the realization of their aim of responsible government and the enactment of other reforms, including municipal self-government for Canada West (Upper Canada, now in Ontario) and freeing of the University of Toronto from sectarian control.

Feeling increasingly out of sympathy with the advanced reformers in his party and offended by an attempt to abolish the Court of Chancery in Canada West, which he had personally helped to establish, Baldwin resigned in 1851. He was not reelected to Parliament by Toronto, largely because of his uncommitted attitude toward the Clergy Reserves question, regarding the secularization of the one-eighth of crown lands in Canada set apart for the support of a Protestant clergy. In 1858 the

coalition Liberal-Conservative Party invited him to stand for a seat in the upper house, but, dissociated from the radicals, he could not identify with the conservative element of the Liberal Party either. In retirement he devoted himself to the improvement of Anglo-French relations in Canada.

Baldwin, Roger Nash (b. Jan. 21, 1884, Wellesley, Mass., U.S.—d. Aug. 26, 1981, Ridgewood, N.J.), American civil-rights activist, cofounder of the American Civil Liberties Union (ACLU).

Born into an aristocratic Massachusetts family, Baldwin attended Harvard University (B.A., 1904; M.A., 1905). He then taught sociology at Washington University in St. Louis, Mo. (1906–09), and also served as chief probation officer of the city's Juvenile Court (1907–10) and secretary of the reformist Civic League of St. Louis (1910–17). When the United States entered World War I, Baldwin became head of the pacifist American Union Against Militarism (predecessor of the ACLU), which defended draft resisters and conscientious objectors; in 1918–19 he spent nine months in jail for refusing to be drafted. Afterward, he wandered about for a year, joining the Industrial Workers of the World (IWW) and finally ending up in New York City in 1920 to help found the ACLU. He was its director (1920–50) and then its national chairman (1950–55).

During Baldwin's tenure as head of the ACLU, the organization acquired such diverse clients as teacher John T. Scopes in the 1925 Tennessee "Monkey Trial"; the Jehovah's Witnesses, which won free-press rights in 1938; James Joyce, who had the ban lifted from his novel *Ulysses*; and Henry Ford, who was granted the right to distribute antiunion pamphlets. The ACLU defended persons of all persuasions, including radicals on the far left and on the far right.

In 1940 Baldwin became disenchanted with the communists and removed them from the ACLU's board of directors. In the end he made civil rights a universal cause—a reversal of conditions in the 1920s and '30s, when civil liberties were widely regarded suspiciously as a radical or leftist cause.

Baldwin, Stanley, 1st Earl Baldwin of Bewdley, Viscount Corvedale of Corvedale (b. Aug. 3, 1867, Bewdley, Worcestershire, Eng.—d. Dec. 14, 1947, Astley Hall, near Stourport-on-Severn, Worcestershire [now in Hereford and Worcester]), British Conservative politician, three times prime minister between 1923 and 1937; he headed the government during the General Strike of 1926, the Ethiopian crisis of 1935, and the abdication crisis of 1936.

A relative of the author Rudyard Kipling and the painter Sir Edward Burne-Jones, Baldwin was the only son of Alfred Baldwin, chairman of the Great Western Railway and head of a large concern that included iron and steel manufactories and collieries. Young Baldwin was educated at Harrow and at Trinity College, Cambridge. He managed his father's diversified heavy industries for several years. From 1908 to 1937 he was a member of the House of Commons.

In December 1916 he became parliamentary private secretary to Andrew Bonar Law, chancellor of the Exchequer in David Lloyd George's World War I coalition ministry. From 1917 to 1921 Baldwin served as financial secretary of the treasury, and in 1921 he became president of the Board of Trade. In October 1922, Bonar Law and Baldwin induced a majority of the Conservative members of Parliament to repudiate Lloyd George's coalition. Baldwin was then appointed chancellor of the Exchequer in the new Conservative government headed by Bonar Law. Sent to Washington, D.C., in January 1923 to settle the British World War I debt to the United States, Baldwin was widely criticized at home

for negotiating terms less favourable to Great Britain than had been expected. When ill health forced Bonar Law to retire from his position, it nonetheless was Baldwin whom King George V asked, on May 22, 1923, to form a government. For six months, in the face of uneasy developments abroad, such as the Italian seizure of Corfu, and mounting unemployment at home, Baldwin's government pursued a tranquil course. In October he appealed for a mandate to reverse Bonar Law's free-trade policy; but a mandate was refused, and Baldwin's first ministry ended Jan. 22, 1924.

Baldwin returned to office Nov. 4, 1924, following the downfall of the first Labour prime minister, Ramsay MacDonald. The economic reforms—including the restoration of the wartime McKenna duties (a 40-percent income tax and a 50-percent excess-profits tax), the gold standard, and the silk tax—proposed by Baldwin's appointee to the Exchequer, Winston Churchill, failed to prevent a further

Stanley Baldwin, 1932
Bassano and Vandyk

slump in the coal trade. When the miners went on strike (May 4, 1926) and they were supported with sympathetic strikes in other vital industries, Baldwin proclaimed a state of emergency, organized volunteers to maintain essential services, and refused to negotiate further with labour until the strike was called off (it ended May 12, 1926). The following year he secured passage of the antiunion Trade Disputes Act.

A Conservative electoral defeat over the issues of unemployment and the Trade Disputes Act caused Baldwin to resign June 4, 1929. Returning to the government in 1931 as lord president of the council in MacDonald's national coalition ministry, he promoted the 10 percent ad valorem tariff and the Ottawa agreements of 1932, which established economic protectionism and impelled numerous Liberal ministers to resign. Upon Adolf Hitler's rise to power in Germany in 1933, Nazism first became recognized as an international threat. Because Baldwin feared the domestic political consequences of British rearmament and a firm foreign policy to meet that threat, he failed to act, later saying, "My lips were sealed."

From June 7, 1935, to May 28, 1937, Baldwin once more was prime minister. In view of the Italian conquest of Ethiopia, the unopposed German reoccupation of the Rhineland, and German-Italian intervention in the Spanish Civil War, he began to strengthen the military establishment while showing little outward concern. His government faced public outrage over the agreement (December 1935) between Sir Samuel Hoare, the British foreign secretary, and Pierre Laval, the French premier, to permit fascist Italy to have its way in Ethiopia. At home, the determination of the new king, Edward VIII, to marry an American divorcee, Wallis Warfield Simpson, endangered the prestige of the monarchy and perhaps the unity of the British Empire. Baldwin procured Edward's abdication (Dec.

10, 1936) and satisfied public opinion. Five months later he resigned in favour of Neville Chamberlain, accepted an earldom, and retired from politics.

Bâle (Switzerland): *see* Basel.

Bale, John (b. Nov. 21, 1495, Cove, Suffolk, Eng.—d. November 1563, Canterbury, Kent), bishop, Protestant controversialist, and dramatist whose *Kyng Johan* is asserted to have been the first English history play. He is notable for his part in the religious strife of the 16th century and for his antiquarian studies, including the first rudimentary history of English literature.

Bale was educated at a Carmelite convent in Norwich and at Cambridge. He was the prior of Carmelite convents at Maldon, Doncaster, and Ipswich at various times but became a Protestant and at some date (probably 1533) left his order, married, and became rector of Thorndon, Suffolk. Frequently attacked and once imprisoned for his religious views, he took refuge on the European continent from 1540 to 1548 and from 1553 until after the accession of Elizabeth in 1558. In 1560 he was appointed to the staff of Canterbury Cathedral.

Bale's voluminous writings are characterized by a fiercely partisan spirit, crude but vigorous satire, and frequent scurrility. His plays, only five of which survive, are thought to belong to the early 1530s. They employ the old forms of miracle and morality play as vehicles of Protestant propaganda. His most ambitious effort was three biographical catalogs of English writers: the *Illustrium majoris Britanniae scriptorum* (1548); the revised and much-expanded *Scriptorum illustrium majoris Britanniae catalogus* (1557–59; reprinted 1977); and an autograph notebook, first published in 1902 by R.L. Poole and M. Bateson as *Index Britanniae Scriptorum Quos Collegit J. Baleus*. Though not always accurate, this early literary history is invaluable to students of the medieval and early Tudor periods.

Balearic Islands, Spanish ISLAS BALEARES, archipelago in the western Mediterranean Sea, and a *comunidad autónoma* ("autonomous community") of Spain coextensive with the Spanish *provincia* of the same name and established by the statute of autonomy in 1983.

The archipelago lies 50 to 190 miles (80 to 300 km) east of the Spanish mainland and has a land area of 1,936 square miles (5,014 square km). There are two groups of islands. The eastern and larger forms the Balearics proper and includes the principal islands of Majorca (Spanish: Mallorca) and Minorca (Menorca) and the small island of Cabrera. The western group is known as the Pitiusas and includes the islands of Ibiza and Formentera. The archipelago is an extension of the sub-Baetic mountains of peninsular Spain, and the two are linked by a sill near Cape Nao in the province of Alicante. The Balearics exhibit a varied terrain, with undulating hills, plateaus, and lowlands. Minorca has extensive plains. Annual precipitation is low, rarely exceeding 18 inches (450 mm), and occurs mainly in the autumn and spring.

The Balearics were conquered by the Vandals in 526 and fell to the Byzantines in 534. The Muslim occupation of the islands was complete by 903. James I of Aragon conquered the islands of Majorca and Ibiza between 1229 and 1235, and Minorca fell to his descendant, Alfonso III, in 1287. The Balearics were established as an autonomous kingdom in 1298 and rejoined Aragon in 1349. The British

captured Mahón in 1708, and the Treaties of Utrecht in 1713 ceded Minorca to the British, who occupied it until 1802. The Balearics were established as a Spanish province in 1833.

A regionalist movement emerged in the late 19th century but failed to consolidate. A statute of autonomy was proposed in 1931, but not until the Organic Law of Feb. 25, 1983, was one finally enacted.

Palma is the capital as well as the military, judicial, and ecclesiastical centre of the autonomous community. The government encompasses the insular councils of Majorca, Minorca, and Ibiza-Formentera.

The raids of Barbary pirates discouraged settlement along the coast until the 19th century. The spread of tourism since the mid-19th century has led to the concentration of the population along the coastal areas and the depopulation of the hinterland. The population of Majorca and Minorca is heavily concentrated in the larger cities, while that of the islands of Ibiza and Formentera tends to be dispersed. Farmland is often subdivided into *minifundios* (small landholdings), the number of *latifundios* (large landholdings) having declined sharply since 1920.

Emigration from the hinterland has sharply reduced the agricultural workforce in the islands. The traditional Mediterranean crops of wheat, grapes, and olives predominated until 1830, when improved transport allowed new

Balearic Islands

cash crops to be taken to more distant markets. These include almonds, peaches, apricots, carob, and tomatoes. Dry farming predominates, though the waterwheels and windmills that were introduced by the Muslims for irrigation persist. Sir Richard Kane, governor of Minorca between 1712 and 1736, introduced cattle and sheep from North Africa and pigs from Sardinia; these breeds continue to be raised.

Manufacturing is of relatively little importance, and most establishments have fewer than five employees. Manufactures include shoes, furniture, and textiles. Fine lace and embroidery are made for tourists. Tourism, which dominates the economy, offers only seasonal employment, with much of the workforce idle during the winter.

Varied civilizations have left their marks on the islands, and, although the prehistoric talayotic civilization (so termed from its characteristic rough stone towers called talayots) seems to have continued without much modification, the focal position of the islands in the Mediterranean laid them open to continued influence from civilizations centred farther to the east, as many archaeological finds attest. Important discoveries of bronze swords and single and double axes, antennae swords, and heads and figures of bulls and other animals all bear witness to foreign influence over long periods of time. Pottery, mostly of the native talayotic types, seems to have persisted with little change until the Roman occupation. Historical evidence points to at least 2,600 years of settlement, for the islands were successively ruled by Carthaginians, Romans, Vandals, Moors, and Spaniards, all of whom have left their mark. *See also* Majorca; Minorca; Ibiza. Pop. (1991 prelim.) 702,770.

baleen whale, also called TOOTHLESS WHALE, any of several whales of the suborder Mysticeti (order Cetacea), distinguished from other groups by a specialized feeding structure, the baleen, or whalebone. Whalebone was once widely used for stays in women's corsets and is still used in some industrial brushes.

The baleen, which is used to strain plankton and small crustaceans from the water, consists of two horny plates attached to the roof of the mouth. Each plate is composed of a series of parallel slats with fringes that mat together to form a sieve. There are about 300 slats in each triangular-shaped plate, which may be as long as 3.6 m (12 feet) in the right whale.

For more information on baleen whale species and groups, *see* blue whale; fin whale; gray whale; humpback whale; right whale; orqqual; sei whale.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Balenciaga, Cristóbal (b. Jan. 21, 1895, Guetaria, Spain—d. March 23, 1972, Valencia), Spanish dress designer who created elegant ball gowns and other classic designs.

Balenciaga began seriously studying dressmaking at the age of 10, when the death of his father, a sea captain, made it necessary for his mother to support the family by sewing. His first trip to Paris at 15 inspired him to become a couturier, and by age 20 he had his own dressmaking establishment at the fashionable summer resort of San Sebastián in Spain.

In the next 15 years Balenciaga became the leading couturier of Spain. In 1937, when the Spanish Civil War disrupted his business, he moved to Paris. For the next 30 years his collections featured sumptuously elegant dresses and suits. Balenciaga helped popularize the trend toward capes and flowing clothes without waistlines in the late 1950s and the use of plastic for rainwear in the mid-1960s. In 1968 the house of Balenciaga closed, and he retired.

baler, largest living snail, a species of conch (*q.v.*).

Bales, Peter, also called PETER BALESIUS (b. 1547, London, Eng.—d. 1610?), English calligrapher who devised one of the earliest forms of shorthand, published in his book *Arte of Brachygraphie* (1590).

A highly skilled copyist, Bales gained fame for his microscopic writing, producing a Bible about the size of a walnut. He inscribed a number of texts within a circumference about that of a penny, mounted this example of dexterous penmanship on a ring, and presented it to Queen Elizabeth I, who greatly admired it. His skill in imitating handwriting was used for secret state purposes by Elizabeth's principal secretary, Sir Francis Walsingham, and helped uncover Anthony Babington's plot to assassinate the queen. He headed a penmanship school in 1590, when he published *Writing Schoolemaster, in Three Parts*.

Bāleshwar (India): *see* Balasore.

Balewa, Sir Abubakar Tafawa (b. 1912, Bauchi, Northern Nigeria—d. January 1966, near Ifo, Nigeria), Nigerian politician, leader in the Northern Peoples Congress (NPC), and the first federal prime minister. A commoner by birth, an unusual origin for a political leader in the NPC, Balewa was both a defender of northern special interests and an advocate of reform and Nigerian unity.

Balewa was a teacher by profession and was one of the first Northern Nigerians to be sent to London University Institute of Education (1945). On his return in 1946 he was elected to the House of Assembly of the Northern Region and in 1947 was one of five representatives to the Central Legislative Council in

Lagos. He was reelected to the assembly in 1951 despite the hostility of some conservative *amirs* of the generally Muslim north.

From 1952 until his death Balewa served in the federal government: he was minister of works and of transport in the middle 1950s, and then, as leader of the NPC in the House of Representatives, he was made the first prime minister of Nigeria. After the preindependence elections of 1959, he again became prime minister in a coalition government of the NPC and Nnamdi Azikiwe's National Council of Nigeria and the Cameroons. As prime minister of independent Nigeria, he was sharply circumscribed in his powers by those delegated to regional premiers. He proved unable to mitigate the growing tensions of 1964–66, manifested by a partial boycott of the election in 1964, army unrest, and outbreaks of violence in the Western Region. He was killed in the first of two Nigerian army coups in 1966.

Balfe, Michael William (b. May 15, 1808, Dublin—d. Oct. 20, 1870, near Ware, Hertfordshire, Eng.), singer and composer, best

Balfe, lithograph by F. Salabert

By courtesy of the trustees of the British Museum photograph J.R. Freeman & Co. Ltd

known for the facile melody and simple vocal effects of his opera *The Bohemian Girl*.

Balfe appeared as a violinist at the age of nine and began composing at about the same time. In 1823 he went to London, where he played in the orchestra at Drury Lane Theatre, and in 1825 was taken to Rome by Count Mazzara, a wealthy patron. Between 1827 and 1833 he sang leading baritone roles in operas by Rossini, Meyerbeer, and others in Paris and Italy. His own early operas were written on Italian librettos and produced at Palermo, Pavia, and Milan between 1829 and 1833, after which he returned to London. His first English opera, *The Siege of Rochelle*, was produced at Drury Lane in 1835. His popularity was established; in 1838 he sang Papageno in the first English performance of *The Magic Flute*, and with *Le Puits d'amour* (Paris, 1843) he began a series of French operas.

The Bohemian Girl (Drury Lane, 1843) was the most successful of all his operas and was produced in many countries, in French, German, Italian, and Russian. Two of the ballads from it, "When Other Lips" and "I Dreamt That I Dwelt in Marble Halls," have been published in many arrangements.

Balfe produced several other operas in London; essayed managing and conducting with little success; and between 1849 and 1864 travelled in France, Germany, Italy, and Russia.

Balfour (of Whittingehame), Arthur James Balfour, 1st earl of, Viscount TRAPRAIN (b. July 25, 1848, Whittingehame, East Lothian, Scot.—d. March 19, 1930, Woking, Surrey, Eng.), British statesman who maintained a position of power in the British Conservative Party for 50 years; he was prime minister from 1902 to 1905, and as foreign secretary from 1916 to 1919 he is perhaps best remembered for his World War I statement (the Balfour Declaration) expressing official British approval of Zionism.

The son of James Maitland Balfour and a nephew of Robert Cecil, 3rd marquess of Salisbury, Balfour was a member of a highly intellectual, wealthy, and aristocratic circle. He was educated at Eton and at Trinity College, Cambridge, and, upon leaving Cambridge, he entered Parliament as a Conservative member for Hertford. In 1879 he published his *Defence of Philosophic Doubt* in which he endeavoured to show that scientific knowledge depends just as much as theology upon an act of faith. In the great Victorian struggle between science and religion, Balfour was on the side of religion. He continued to take a keen interest in scientific and philosophical problems throughout his life.

Balfour was president of the Local Government Board in his uncle's first government (1885–86). In the second Salisbury ministry (1886–92), he was secretary for Scotland and then chief secretary for Ireland, with a seat in the Cabinet. An implacable opponent of Irish Home Rule, he earned the name "Bloody Balfour" because of his severity in suppressing insurrection. At the same time he opposed the evils of English absentee landlordism in Ireland and made various concessions for the purpose of "killing home rule by kindness."

Known as a formidable parliamentary debater, Balfour became (1891) leader of the House of Commons and first lord of the treasury, thus being second in command to Lord Salisbury. During W.E. Gladstone's last Liberal ministry (1892–94), he led the opposition in the House of Commons. In the last of Salisbury's three governments (1895–1902), Balfour became more powerful as his uncle's health declined. Although he disapproved of the policies that resulted in the South African (Boer) War (1899–1902), he insisted that the British win the war decisively.

After Salisbury's retirement, Balfour served as prime minister from July 12, 1902, to Dec. 4, 1905. He sponsored and secured passage of the Education Act (Balfour Act; 1902), which reorganized the local administration of elementary and secondary schools. The Wyndham Land Purchase Act (1903) encouraged the sale of land to tenant farmers in Ireland. The Committee of Imperial Defense (created 1904) made possible a realistic worldwide British strategy. None of these measures was especially popular with the voters. Balfour also decided to meet a shortage of miners in South Africa by importing large numbers of indentured Chinese, a decision that was condemned by humanitarians and by British organized labour. After a Cabinet crisis in 1903, Balfour regained prestige in the completion of negotiations for the Anglo-French agreement (Entente Cordiale; 1904), a major change in British foreign policy, by which the supremacy of Great Britain in Egypt and of France in Morocco was recognized. Increasing Conservative disunity over the question of abandoning free trade finally caused him to resign, although he remained the official party leader until November 1911.

On May 25, 1915, when H.H. Asquith formed a wartime coalition ministry, Balfour succeeded Winston Churchill as first lord of

Arthur James Balfour, c. 1900
Bassano and Vandyk

the Admiralty. In the political crisis of December 1916, he ceased to support Asquith and turned to David Lloyd George, in whose new coalition he became foreign secretary. In that office he had little to do with the conduct of World War I or with the peace negotiations.

His most important action occurred on Nov. 2, 1917, when, prompted by the Zionist leaders Chaim Weizmann and Nahum Sokolow, he wrote a letter to Baron Rothschild, head of the English branch of the Jewish banking family, that contained the so-called Balfour Declaration. This declaration, pledging British aid for Zionist efforts to establish a home for world Jewry in Palestine, gave great impetus to the establishment of the state of Israel.

After the war Balfour served twice (1919–22, 1925–29) in the Cabinet post of lord president of the council. He was largely responsible for the negotiations that led to the definition of relations between Great Britain and the dominions—the Balfour Report (1926)—which was to be expressed in the Statute of Westminster in 1931. In 1922 he was created an earl. His *Chapters of Autobiography* (1930) was edited by B.E.C. Dugdale, who also wrote *Arthur James Balfour*, 2 vol. (1936).

Balfour, Francis Maitland (b. Nov. 10, 1851, Edinburgh—d. July 19, 1882, near Martigny-Ville, Switz.), British zoologist, younger brother of the statesman Arthur James Balfour, and a founder of modern embryology.

Francis Maitland Balfour, engraving
The Mansell Collection

His interest in the subject was aroused by the lectures of the British physiologist Michael Foster, and, after graduation from Cambridge in 1873, Balfour obtained one of the university's chairs at the Stazione Zoologica in Naples, an international centre for marine biological research. During the next five years, he made many original observations about the embryonic development of vertebrate urogenital organs (e.g., kidneys, sex organs) and the origin of spinal nerves. These discoveries, along with his descriptions of the initial changes in the ovum after fertilization and of the early stages of the embryo, provided crucial information on the evolution of invertebrates to vertebrates.

He returned to Cambridge in 1876 to lecture on animal morphology and there published *A Treatise on Comparative Embryology* (1880–81), which laid the foundations of modern embryology. Such was his fame that he was invited to succeed the eminent biologists George Rolleston at Oxford and Sir Charles Wyville Thomson at Edinburgh, but he refused both offers to remain at Cambridge, where in 1882 a special professorship in animal morphology was created for him. Before he could assume his new position, however, he died in a fall while attempting to scale the unconquered Aiguille Blanche of Mont Blanc.

Balfour Declaration (Nov. 2, 1917), statement of British support for "the establishment

in Palestine of a national home for the Jewish people." It was made in a letter from Arthur James Balfour, the British foreign secretary, to Lionel Walter Rothschild, 2nd Baron Rothschild, a leader of British Jewry.

The Balfour Declaration, issued through the continued efforts of Chaim Weizmann and Nahum Sokolow, Zionist leaders in London, fell short of the expectations of the Zionists, who had asked for the reconstitution of Palestine as "the" Jewish national home. The declaration specifically stipulated that "nothing shall be done which may prejudice the civil and religious rights of existing non-Jewish communities in Palestine." Nevertheless, it aroused enthusiastic hopes among Zionists and seemed the fulfillment of the aims of the World Zionist Organization.

The British government hoped that the declaration would rally Jewish opinion, especially in the United States, to the side of the Allies and that the settlement in Palestine of a pro-British Jewish population might help to protect the approaches to the Suez Canal in neighbouring Egypt.

The Balfour Declaration was endorsed by the principal Allied powers and was included in the British mandate over Palestine, approved by the League of Nations on July 24, 1922. In May 1939 the British government altered its policy in a white paper recommending a limit of 75,000 further immigrants and an end to immigration by 1944. Zionists condemned the new policy, accusing Britain of favouring the resident Palestinian Arabs of the region.

Bali (India): see Bally.

Bali, island and *propinsi* ("province") in the Lesser Sunda Islands, Indonesia, 1 mile (1.6 km) east of the island of Java. Most of Bali is mountainous (essentially an extension of the central mountain chain in Java), the highest point being Mount Agung, or Bali Peak, 10,308 feet (3,142 m) in height and known locally as the "navel of the world." It proved to be an active volcano, erupting in 1963 (after a dormancy of 120 years), killing more than

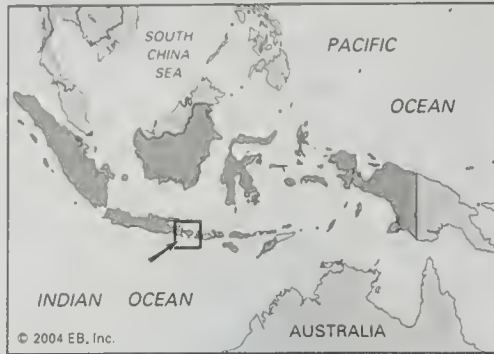

Rice paddies on Bali, Indonesia

Shostal—EB Inc

1,500 persons and leaving thousands homeless. The main lowland is south of the central mountains. The period of the southeast monsoon (May to November) is the dry season. Bali's flora (mostly hilly tropical rain forest) and fauna resemble those of Java. Some teak grows on Bali, and the giant banyan (*waringin*) trees are held sacred by the Balinese. Tigers are found in the west, and deer and wild pigs are numerous.

When Islām triumphed over Hinduism in Java (16th century), Bali became a refuge for many Hindu nobles, priests, and intellectuals. Today it is the only remaining stronghold of Hinduism in the archipelago, and Balinese life is centred on religion—a blend of Hinduism (especially that of the Śaivite sect), Buddhism, Malay ancestor cult, and animistic and magical beliefs and practices. Places of worship are numerous and widespread, and there is a firm belief in reincarnation. Caste is observed,

though less strictly than is the case in India, since nine-tenths of the population belong to the Śūdra, the lowest caste. The nobility is divided into priests (Brahman), the military and ruling royalty (Kshatriya), and the merchants (Vaisya). Some Muslims and Chinese live in northern and western Bali, and there are a few Christians. The Balinese language is distinct from that of eastern Java, but the upper-class form contains many Javanese and Sanskrit words.

Bali

The two major towns are Singaraja and Denpasar, the provincial capital; others include Klungkung, a centre of wood carving and gold and silver industries; Gianyar, with a lively market; Kuta, Sanur, and Nusa Dua, centres of the flourishing tourist trade; and Ubud, in the foothills, a centre for European and American artists, with a fine art museum. All Balinese villages have temples and an assembly hall, usually located on a square that serves for festivals and markets. Each family lives in its own compound surrounded by earthen or stone walls. Population density in the lowlands is more than 1,500 per square mile (580 per square km).

Balinese farmers, raising principally rice, are organized into cooperative water-control boards. The average farm is 2.5 acres (1 hectare). About one-fourth of the agricultural acreage is irrigated, the remainder being used for yams, cassava, corn (maize), coconuts, fruits, and, occasionally, oil palm and coffee plantings. A large cattle population is supplemented by smaller livestock. There are several meat-processing plants; fishing is only a minor occupation. Food must be imported because of the growing population, but exports include beef, pork, coffee, copra, and palm oil. Tourism and the sale of craft articles are important to the economy. There is an airport near Denpasar.

The Balinese are fond of music, poetry, dancing, and festivals, are extraordinarily able in arts and crafts, and are passionately fond of betting games, especially cockfighting. A typical Balinese gamelan (orchestra) consists of various percussion instruments, a two-string violin, and a flute; and every village has its gamelan club. Stage plays and, especially, dancing are an integral part of Balinese life, serving magico-religious purposes or telling stories by pantomime. The artistic temperament is also evident in sculpture, painting, silverwork, and wood carving and bone carving and in the animal-shaped wooden coffins in which corpses are carried to the cremation ground.

Visited by Chinese traders and Indian literati, the Balinese had embraced Hinduism by the 7th century AD. Mahendradatta, the mother of Airlangga (who ruled Java from 1019 to c. 1049), married Udayana, the Balinese king, and many Javanese Hindus immigrated to Bali. In 1284 Kertanagara, last king of Tumapel (Singhasari) in Java, captured Bali; upon his death in 1292, the island regained its independence. Bali came under the rule of the Majapahit empire of eastern Java in 1343 and continued under the Majapahits until the empire was overthrown in 1478 by Muslims.

The Dutch first visited Bali in 1597, when the island was divided among a number of warring Muslim states. The Dutch annexed the northern Balinese states of Buleleng and Jembrana in 1882, and, in the 1894 Dutch invasion of nearby Lombok Island, the Balinese prince, Anak Agung Kutut, was killed. In 1906 the Dutch attacked Denpasar, massacred about 3,600 Balinese, and captured the whole island. Bali was occupied by the Japanese during World War II. In 1946 a battle was fought between Dutch troops and Indonesian revolutionary forces at Marga in western Bali. The island became part of the Republic of Indonesia in 1950. A terrorist bombing on the island in 2002 killed some 180 people. Area *propinsi*, 2,175 square miles (5,633 square km). Pop. (2000) *propinsi*, 3,151,162.

Bali cattle: see banteng.

Balikesir, city, northwestern Turkey, situated on rising ground above a fertile plain that drains to the Sea of Marmara. It lies about where the ancient Roman town of Hadrianotherae lay. In the early 14th century, Balikesir was an important town of the Turkmen Karasi emirate, which was soon absorbed into the Ottoman Empire. The old town and its bazaar, which occupy the upper slopes, contain numerous inns and mosques dating from the early Ottoman period. Below the old town are the modern administrative buildings, the railway station, a teacher-training school, and residential districts. The centre of a rich agricultural province, Balikesir is linked by rail with İzmir and Ankara by way of Kütahya. Industries produce cotton textiles, flour, rugs, and leather goods.

The area around Balikesir has a milder climate than that of inner Anatolia, and its rich soil produces a varied crop of cereals, beans, fruits, vegetables, sesame, cotton, tobacco, and olives. It is also rich in minerals: iron, lead, zinc, antimony, chromium, lignite, and boracite. In the area are many ancient historical and archaeological sites, including those at Edremit, Gönen, and Kaz Dağı (ancient Mount Ida). Pop. (2000) 215,436.

Balikpapan, bay and seaport, Kalimantan Timur *propinsi* ("province"), Indonesia, situated on the eastern coast of Indonesian Borneo, facing the Makasar Strait. It is the site of a major oil refinery that processes both imported and local crude oils. There are producing oil fields—which are operated, though they are no longer controlled, by British-American-Dutch interests—that have been in operation there since 1899 as well as in the coastal region stretching approximately 60 miles (100 km) toward the northeast. The refinery was destroyed in 1942 as part of a "scorched-earth" policy, in the face of the Japanese invasion, but it was rebuilt after World War II. Pop. (2000 prelim.) 409,023.

Balinese, people of the island Bali, Indonesia. They differ from other Indonesians in adhering to the Hindu religion, though their culture has been heavily influenced by the Javanese. Their language belongs to the Austronesian (Malayo-Polynesian) linguistic family.

In the Balinese village each family lives in its own compound, surrounded by earthen or stone walls. The shady courtyard is usually divided into three sections containing, respectively, the rice granaries and cattle sheds, the sleeping quarters and kitchen, and the house temple. The living quarters have walls of clay and roofs of thatch or palm leaves. All villages have temples and an assembly hall, usually located on a square that serves for festivals and markets.

Balinese life centres upon religion, which is Hindu Śaivism (Shaivism) fused with Buddhism, ancestor cults, and belief in spirits and magic. The Balinese believe in reincarnation, and the dead are cremated in order to liberate their souls for the onward journey.

Caste practices exist, but, because most of the population belong to the lowest caste, there is little formality among the villagers. As in Java, there are different modes of speech to reflect differences in social rank.

Each village is a self-contained community, venerating common ancestors and usually subdivided into cooperative societies whose members assist each other in temple maintenance, festivals, and family rites. Family relationships are reckoned through the male line. Marriage is often limited to members of the same *dadia*, or kinship organization. Rice is the main crop; others include yams, sweet potatoes, cassava, and corn (maize).

Baliol FAMILY: *see* Balliol family.

Baliol, Edward de: *see* Edward under Edward (Scotland).

Baliol, John de: *see* John under John (Scotland).

Balkan Entente, also called BALKAN PACT (Feb. 9, 1934), mutual-defense agreement between Greece, Turkey, Romania, and Yugoslavia, intended to guarantee the signatories' territorial integrity and political independence against attack by another Balkan state (*i.e.*, Bulgaria or Albania). The agreement provided for a Permanent Council, composed of the members' foreign ministers, that would coordinate legislation and foster economic cooperation.

Despite professions of unity, the Balkan Entente was ineffective against growing German economic and political influence in the Balkans (1934–39) and against actual Axis aggression during World War II, when Albania had already fallen to the Italians. The entente likewise offered no security to Romania against the territorial claims of either the Soviet Union or Hungary.

Balkan gripe: *see* Q fever.

Balkan League (1866–68), an alliance organized by the Serbian prince Michael III (Mihailo Obrenović). Concluded by the governments of Serbia, Romania, Montenegro, and Greece and a Bulgarian revolutionary society, it tried to drive the Turks from the Balkans and to unite the South Slavs in a single state. The league planned a coordinated rebellion against the Turks, but the assassination of Prince Michael (June 10, 1868) derailed the plans and destroyed the league.

Balkan Mountains, Bulgarian STARA PLANINA ("Old Mountains"), Latin HAEMUS, chief range of the Balkan Peninsula and Bulgaria and an extension of the Alpine-Carpathian folds. The range extends from the Timok River valley near the Serbia and Montenegro border, spreading out eastward for about 330 miles (530 km) into several spurs, rising to 7,795 feet (2,376 m) at Botev peak, and breaking off abruptly at Cape Emine on the Black Sea. The Balkan Mountains form the major divide between the Danube River (north) and the Maritsa River (south) and are crossed by about 20 passes (notably Shipka Pass), by several railway lines, and by the Iskür River. Mineral resources include bituminous and anthracite coal, graphite, and metallic ores, and there are thermal and mineral springs. High alpine meadows descend to coniferous and deciduous forests. Mountain towns such as Veliko Tŭrnovo were focuses for early Bulgarian nationalist movements in the 19th century.

Although no longer a barrier to movement, except in winter, when snow cover is deep, the range is a climatic barrier between the continental climate of the Danube River valley and the transitional continental climate south of the mountains. Rainfall exceeds 40 inches (1,000 mm) on the range, with long, severe winters. The valleys and basins are suitable for agriculture, and there is a small tourist industry.

Balkan Wars (1912–13), two successive military conflicts that deprived the Ottoman Empire of almost all its remaining territory in Europe.

The First Balkan War was fought between the members of the Balkan League—Serbia, Bulgaria, Greece, and Montenegro—and the Ottoman Empire. The Balkan League was formed under Russian auspices in the spring of 1912 to take Macedonia away from Turkey, which was already involved in a war with Italy. The league was able to field a combined force of 750,000 men. Montenegro opened hostilities by declaring war on Turkey on Oct. 8, 1912, and the other members of the league followed suit 10 days later.

The Balkan allies were soon victorious. In Thrace, the Bulgarians defeated the main Ottoman forces, advancing to the outskirts of Constantinople (now Istanbul) and laying siege to Adrianople (Edirne). In Macedonia, the Serbian army achieved a great victory at Kumanovo that enabled it to capture Bitola and to join forces with the Montenegrins and enter Skopje. The Greeks, meanwhile, occupied Salonika (Thessaloniki) and advanced on Ioánnina. In Albania, the Montenegrins besieged Shkodër, and the Serbs entered Durrës.

The Turkish collapse was so complete that all parties were willing to conclude an armistice on Dec. 3, 1912. A peace conference was begun in London, but after a coup d'état by the Young Turks in Constantinople in January 1913, war with the Ottomans was resumed. Again the allies were victorious: Ioánnina fell to the Greeks and Adrianople to the Bulgarians. Under a peace treaty signed in London on May 30, 1913, the Ottoman Empire lost almost all of its remaining European territory, including all of Macedonia and Albania. Albanian independence was insisted upon by the European powers, and Macedonia was to be divided among the Balkan allies.

The Second Balkan War began when Serbia, Greece, and Romania quarreled with Bulgaria over the division of their joint conquests in Macedonia. On June 1, 1913, Serbia and Greece formed an alliance against Bulgaria, and the war began on the night of June 29/30, 1913, when King Ferdinand of Bulgaria ordered his troops to attack Serbian and Greek forces in Macedonia. The Bulgarians were defeated, however, and a peace treaty was signed between the combatants on Aug. 10, 1913. Under the terms of the treaty, Greece and Serbia divided up most of Macedonia between themselves, leaving Bulgaria with only a small part of the region.

As a result of the Balkan Wars, Greece gained southern Macedonia as well as the island of Crete. Serbia gained the Kosovo region and extended into northern and central Macedonia. Albania was made an independent state under a German prince. The political consequences of the wars were considerable. Bulgaria, frustrated in Macedonia, looked to Austria for support, while Serbia, which had been forced by Austria to give up its Albanian conquests, regarded Vienna with greater hostility than ever. The heightened tensions in the Balkans reached their climax in World War I, which was sparked by the assassination of the Austrian heir-apparent by a Serb in Sarajevo, Bosnia, on June 28, 1914.

Balkanization, division of a multinational state into smaller, ethnically homogeneous entities. It also is used to refer to ethnic conflict within multiethnic states. The term was coined at the end of World War I to describe the ethnic and political fragmentation that followed the breakup of the Ottoman Empire, particularly in the Balkans. The term is today invoked to explain the disintegration of some multiethnic states and their devolution into dictatorship, ethnic cleansing (*q.v.*), and civil war.

Balkanization has occurred in places other than the Balkans, including in Africa in the

1950s and '60s following the dissolution of the British and French colonial empires there. In the early 1990s the disintegration of Yugoslavia and the collapse of the Soviet Union led to the emergence of several new states—many of which were unstable and ethnically mixed—and then to violence between them. Many of the successor states contained seemingly intractable ethnic and religious divisions, and some made irredentist territorial claims against their neighbours. Armenia and Azerbaijan, for example, suffered from intermittent violence over ethnic enclaves and borders. In the 1990s in Bosnia and Herzegovina, ethnic divisions and intervention by Yugoslavia and Croatia led to widespread fighting between Serbs, Croats, and Bosniacs (Muslims) that resulted in the deaths of more than 10,000 people. (R.W.P.)

Balkans, also called BALKAN PENINSULA, the easternmost of Europe's three great southern peninsulas and, collectively, the countries located there. The term "Balkan" came into use only in the mid-19th century and initially referred to the land lying south of the Stara Planina, a mountain range in Bulgaria that the Turks referred to as the Balkan Mountains. After the earlier term "Turkey-in-Europe" was rendered obsolete by the disintegration of the Ottoman Empire, "Balkans," meaning "Mountain" in Turkish, became a synonym for the European parts of the Ottoman Empire, and it also came to include some areas formerly under Austrian Habsburg or Russian control. Geographers, ethnographers, and historians have laboured fruitlessly for a century and a half to establish unambiguous natural boundaries to the Balkan region. In contemporary usage the term "Balkans" comprises the countries of Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Macedonia, Moldova, Romania, Serbia and Montenegro, and Slovenia. Parts of Greece also fall within the region.

A brief treatment of the Balkans follows. For full treatment, *see* MACROPAEDIA: Balkan States.

The land. The geographic character of the Balkans is shaped largely by mountain ranges: the Balkan Mountains lie east-west across Bulgaria, the Rhodope Mountains extend along the Greek-Bulgarian border, the Dinaric range extends down the Adriatic coast to Albania, and the Pindus Mountains provide a spinal column for Greece. The region is bounded in the north by the Julian Alps and by the Carpathians. Among these ranges, extensive areas of good arable land are relatively scarce: the valleys of the Danube, Sava, and Vardar rivers, eastern Bulgaria, and parts of the Aegean Sea coast provide valuable resources in this respect. By far the most important of such areas is the Danubian Plain. The mountains also place serious difficulties in the way of communication in some areas, and they have a significant impact on the climate of the peninsula. The northern and central parts of the Balkan Peninsula have a central European climate, characterized by cold winters, warm summers, and well-distributed rainfall. The southern and coastal areas, however, have a Mediterranean type of climate, with hot, dry summers and mild, relatively rainy winters.

The people. Because the Balkan Peninsula has been a region of migration and mixing of peoples for many centuries, ethnic diversity has come to be one of its most characteristic social and political features. The most numerous of the groups is the South Slavs, who form the majority of the population in Bulgaria, Serbia and Montenegro, Bosnia and Herzegovina, Croatia, Slovenia, and Macedonia. The Bulgarians, Macedonians, and Slovenes speak their own Slavic languages, while the

Slavs of Serbia and Montenegro, Croatia, and Bosnia and Herzegovina all speak dialects of Serbo-Croatian. Dating from the 9th century, when local tribes began to be converted to Christianity either by adherents of the Roman Catholic or Orthodox churches, the South Slav languages have been written in either the Latin script (parts of Bosnia and Herzegovina, Croatia, and Slovenia) or the Cyrillic script (Serbia and Montenegro, Bulgaria, parts of Bosnia and Herzegovina, and Macedonia). The Albanians and Greeks both speak ancient and very distinctive, non-Slavonic languages, while the Romanians, though heavily influenced by neighbouring Slavs, speak a Latin-based tongue. Substantial minorities of Magyars (Hungarians), Turks, Roma (Gypsies), and others continue to use their own languages.

Religion also imparts a significant measure of diversity. The Slovenes and Croats are predominantly Roman Catholic, as are numbers of Albanians and Romanians. Islām is the faith of the Turkish minority, the majority of Albanians and Roma, and some Bulgarians. Especially in Bosnia and Herzegovina but also in Macedonia and Serbia and Montenegro, many indigenous Slavs converted to Islām following the arrival of the Ottoman Turks in the 14th century, and these people, while undistinguished from their neighbours in other ways, regard themselves as ethnic Muslims. Elsewhere, churches of the Eastern Orthodox tradition predominate, organized on a national basis—e.g., Bulgarian, Greek, Macedonian, Romanian, Serbian, and Albanian.

Ethnicity came to be especially important in the Balkans during the 19th century, when the division of the Habsburg and Ottoman empires began to result in modern states without respect for patterns of language or religious adherence. As a result, there are large Albanian populations in both Serbia and Macedonia, and Greece has important Albanian and Slav minorities. There are substantial Magyar settlements both in northern Serbia and Romanian Transylvania. The most widely dispersed of all the Balkan peoples are the Serbs, who live in great numbers in Bosnia and Herzegovina and in Croatia.

Balkans

Economic history. Although many parts of the Balkan Peninsula are relatively rich in natural resources, the region has generally lagged behind the rest of Europe with respect to economic development. Historically, the mixed terrain of mountains, hills, valleys, and plains meant a scarcity of good farmland and an absence of roads, which in turn hindered commerce and the growth of towns. For many centuries, the basic settlement was the small, self-sufficient farming village, and large towns and cities were few or nonexistent. Moreover, the rule of the Ottoman Empire tended to dis-

courage technical innovation and commerce, while those areas within the Habsburg lands were treated as sources of agricultural produce and raw materials to serve industrial centres located elsewhere in that empire.

It was not until their independence was achieved in the 19th and early 20th centuries that it became feasible to embark on the road of industrialization. But when independent states did begin to emerge, they often found that infrastructural development served foreign economic interests rather than their own needs. The preponderance of small landholdings in most areas, together with high birthrates and rapidly growing populations, meant that despite attempts at land reform undertaken after 1918, agriculture remained technically backward and yielded small marketable surpluses. Another serious obstacle to development was massive spending on armed forces, which were perceived to be vital in a region of unstable and small states that were ethnically divided and subject to the pressure of powerful outside interests. Only in Slovenia, parts of Croatia, the Danubian Plain, and the Romanian oil fields was there any significant economic modernization before 1945.

After World War II, during which the Balkans suffered great material and human damage, the entire region with the exception of Greece fell under communist regimes. Progress was made at this time in the building of infrastructure and of such basic services as housing, education, and health. Even so, heavily centralized planning systems were imposed, subordinated to the needs of the Soviet Union; the result was technical backwardness, inefficiency, and lack of sectoral balance. In Romania a potentially sound economic base provided by oil was squandered by the extraordinary policies of Nicolae Ceaușescu (leader of Romania from 1965 to 1989). Albania's Stalinist regime led the country into deep isolation and left it the poorest country in Europe. Yugoslavia's system of "workers' self-management" proved both more flexible and more responsive to the need for consumer goods; this, together with the strength of its private sector in agriculture, generated a greater prosperity than in any of the other socialist countries. Greece stood outside the socialist system, its economic performance assisted by tourism, trade, and an unusually high level of remittances from Greeks working abroad.

Throughout most of the region a rather dogmatic communist identification of economic progress with the development of mining and manufacturing resulted in a general neglect of agriculture, excessively high rates of urbanization, an aging rural population, and massive (though largely concealed) urban unemployment. After the collapse of communist regimes throughout the region in 1989, economic reconstruction was endangered by lack of modern managerial skills and technological sophistication, shortage of investment, the loss of traditional markets, and the real practical and legal difficulties involved in programs of privatization.

Political history. The political history of the Balkans begins with the emergence of Greek city-states in the second half of the 2nd millennium BC. These were consolidated from time to time into larger units, such as the empire of Alexander I the Great in the 3rd century BC. Shortly after Alexander's death, the Romans began to extend their control throughout the peninsula, creating the provinces of Illyricum, Moesia, and Dacia. In AD 395 the Roman Empire was divided, and most of Rome's possessions in the Balkans were transferred to the eastern empire, with its capital in Constantinople (now Istanbul, Turkey). This developed into the Byzantine Empire, which had a predominantly Greek rather than Latin culture—a political and cultural divide that widened after the schism between the Roman Catholic and Orthodox

churches during the 11th century. The rule of Byzantium was repeatedly challenged by migratory Asian peoples, Goths, Huns, Avars, Bulgars, Pechenegs, and others. During the 6th and 7th centuries southward-migrating Slav tribes crossed the Danube River and began to settle in the Balkans, spreading as far as northern Greece. A Turkic-speaking people called the Bulgars arrived from the Volga region in the 7th century and assimilated a Slavic language and culture. A number of substantial but transitory Slav states were created during the medieval period, the largest and most durable being that of the Serb Nemanjić dynasty, which flourished between the mid-12th and mid-14th century. Norman knights and Latin Crusaders also sought to impose their authority on parts of the region.

The Ottoman Turks began their advance into the Balkans after 1358. The Christian states proved unable either to mount a combined resistance or to secure sufficient support from other European powers. By the end of the 15th century the Turks had occupied the entire peninsula, except for some isolated coastal areas. They took Constantinople itself in 1453 and thus put an end to the Byzantine Empire. They took Belgrade in 1521 and even pushed into central Europe, being repulsed at Vienna in 1529.

The Ottomans ruled much of the Balkans for the next 400 years. Initially, the religious toleration and administrative efficiency of their regime compared favourably with those which it replaced. Its vigor and effectiveness depended, however, upon the flow of booty gained through constant military expansion, and by the 18th century this expansion was halted. The ruling elite failed to make the transition to a settled and stable order; corruption and maladministration set in, and increasingly frequent local rebellions led to intervention by the European powers in the Balkans.

The Ottoman Empire began a slow process of decline and dismemberment. At the conclusion of the war of 1683–99, Austria, Russia, Venice, and Poland forced the Ottomans to sign the Treaty of Carlowitz, in which the Ottomans ceded to the Austrian Habsburgs most of Hungary, Transylvania (now in eastern Hungary and western Romania), Croatia, and Slavonia. This agreement established what was to be a relatively stable Austrian-Ottoman frontier along the Danube and Sava rivers.

During the 18th century Russia extended its borders steadily southward to the Black Sea, and by the Treaty of Küçük Kaynarca (1774) it gained the right to intervene on behalf of the Balkan Christians in their relations with the Ottoman government. Ottoman authority in the Balkans continued to erode. The Greek revolution of 1821–29 and the Russo-Turkish War of 1828–29 forced the Turks (under the Treaty of Adrianople) to grant autonomy to Serbia, Moldavia, and Walachia and to grant full independence to Greece. The state of Serbia was created in 1830.

The disposition of the Ottoman Empire's remaining territories in the Balkans was thenceforth a major point of conflict and contention between the great European powers until the end of World War I. In 1861 the principalities of Moldavia and Walachia merged to form what would become Romania. An uprising against Ottoman rule in Bosnia and Herzegovina in 1875 had far-reaching consequences, drawing first Serbia and Montenegro and then Russia into what became the Russo-Turkish War of 1877–78. The Ottomans were defeated, and peace treaties concluded at San Stefano and revised at the Congress of Berlin (1878) enlarged both Serbia and Montenegro, gave full independence to Romania, created an independent Bulgaria, and placed Bosnia and Herzegovina under Austro-Hungarian administration. (Bosnia was annexed outright in 1908.) By 1890 only Macedonia and Albania remained to Turkey in the Balkans.

A protracted period of maneuvering followed in which the European Great Powers sought to gain control of these remaining Turkish possessions in Europe. They were forestalled in 1912 when Bulgaria, Greece, Montenegro, and Serbia formed an alliance against Turkey and, in two Balkan Wars (1912–13), ended Ottoman rule in Europe. Macedonia was divided (principally between Greece and Serbia) and an independent Albania was formed.

Although the borders drawn in 1913 laid the basis for the modern map of the Balkans, instability continued, largely due to conflicting Austro-Hungarian and Serbian ambitions over Bosnia and Herzegovina. The assassination of the Austrian archduke Francis Ferdinand in Bosnia by a young Serbian revolutionary on June 28, 1914, resulted in an Austrian declaration of war on Serbia that, because of a network of interlocking military alliances throughout Europe, precipitated World War I.

The defeat of Austria-Hungary in World War I permitted further redrawing of the map of the Balkans. Slovenia, Croatia, and Slavonia were freed from Habsburg rule and joined with Serbia and Montenegro to form a Kingdom of Serbs, Croats, and Slovenes. Romania was greatly enlarged when it received much of Transylvania from Hungary. The interwar period was one of great instability for the Balkans, however, as newly formed states sought to establish themselves against a background of continuing international political and economic crisis. Fledgling democracies lapsed into dictatorship in Romania and Bulgaria, and the Kingdom of Serbs, Croats, and Slovenes became "Yugoslavia" after a royal coup d'état in 1929.

During World War II the Balkan Peninsula once more became a field in which larger European interests fought for control. Romania and Bulgaria were initially drawn into alliance with the Axis powers of Germany and Italy. Germany occupied Yugoslavia and Greece, and Italy annexed Albania. The Soviet Union had liberated most of the Balkans by early 1945, however. The powerful Soviet Red Army brought Romania and Bulgaria under Soviet-sponsored regimes in 1945; and the strength of indigenous communist resistance movements in Yugoslavia and Albania also moved these countries into the Soviet sphere of influence for a time. Civil war in Greece was waged until 1949, when the communists were defeated. Subsequently Bulgaria, Moldova, and Romania were all firmly incorporated into the Soviet system through the Warsaw Pact military alliance and Comecon. The Yugoslavs, on the other hand, developed a distinctively liberal form of communism at home and a stance of nonalignment in international affairs, while Albania retreated into deep isolation and a rigid form of Stalinism. Free from Soviet tutelage, Greece hovered between democracy, socialism, and military dictatorship, its international stance shaped more by poor relations with Turkey than by any threat from the Soviet Union.

For 40 years after World War II, Balkan politics were dictated by the Cold War between the superpowers. It was only with the collapse of the Soviet Union after 1989 that the Balkan states rediscovered possibilities for real political change. Everywhere in the region, ruling communist parties were displaced from power, although, in most countries of the region, reconstructed socialist parties managed to survive within new democratic systems. The construction of democratic politics was seriously hampered, however, by the lack of a tradition of political participation, by vestiges of dictatorial order, by severe economic problems, and by ethnic divisions. These problems were experienced most acutely in Yugoslavia, whose disintegration into its component republics was accompanied by a bloody and bitter civil war. Eventually, Bosnia and Herzegovina, Croatia, Macedonia, and Slove-

nia gained independence, and in 2003 Yugoslavia (consisting only of the republics of Serbia and Montenegro) was renamed Serbia and Montenegro. (J.B.A./Ed.)

Balkh, also called VAZĪRĀBĀD, village in northern Afghanistan that was formerly Bactra, the capital of ancient Bactria. It lies 14 miles (22 km) west of the city of Mazār-e Sharīf and is situated along the Balkh River. A settlement existed at the site as early as 500 BC, and the town was captured by Alexander the Great about 330 BC. Thereafter it was the capital of the Greek satrapy of Bactria. In succeeding centuries the city fell to various nomadic invaders, including the Turks and Kushāns, until it was decisively taken by the Arabs in the 8th century. Balkh then became

Shrine of Khvājeh Abū Naṣr Pārsā, 16th century, Balkh, Afg.

K. Horold—Bavaria Verlag

the capital of Khorāsān; it enlarged greatly in size under the 'Abbāsids and Sāmānids. Balkh was completely destroyed by the Mongols under Genghis Khan in 1220. Thereafter it lay in ruins until, after its capture by Timur, it was rebuilt early in the 15th century. But in 1480 the alleged discovery of the tomb of 'Alī, the Prophet Muḥammad's son-in-law, in neighbouring Mazār-e Sharīf once again reduced Balkh to insignificance. Balkh was incorporated into Afghanistan in 1850.

The modern village of Balkh is situated amid extensive ruins, chief among them the outer walls of ancient Bactra, which are more than 7 miles (11 km) in circumference. Other remains of Balkh's splendour include ancient Buddhist reliquary mounds and later Islāmic shrines and mosques. The shrine of Khvājeh Abū Naṣr Pārsā is a remnant of its historic past. Pop. (latest est.) 2,735.

Balkhash (city, Kazakhstan): *see* Balqash.

Balkhash, Lake, also spelled BALQASH, or BALCHAŠ, lake, situated in east-central Kazakhstan. The lake lies in the vast Balkhash-Alakol basin at 1,122 feet (342 m) above sea level and is situated 600 miles (966 km) east of the Aral Sea. It is 376 miles (605 km) long from west to east. Its area varies within significant limits, depending on the water balance. In years in which there is an abundance of water (as at the beginning of the 20th century and in the decade 1958–69), the lake's area reaches 6,900–7,300 square miles (18,000–19,000 square km). In drought-afflicted periods, however (as at the end of the 19th century and in the 1930s and '40s), the area of the lake decreases to 6,000–6,300 square miles (15,500–16,300 square km). Such changes in area are accompanied by changes in the water level of about 10 feet (3 m). Such variability is caused by the structure of the basin and fluctuations in climate. Jutting far out into the lake is the Sarymsek Peninsula (Poluostrov), which divides Balkhash into two separate hydrologic parts: a western part, wide and shal-

low, and an eastern part, narrow and relatively deep. Accordingly, the width of the lake changes from 46 to 17 miles (74 to 27 km) in the western part and 6 to 12 miles (10 to 19 km) in the eastern part. The depth of the western part does not exceed 36 feet (11 m), whereas the eastern part reaches 85 feet (26 m). The two parts of the lake are united by a narrow strait, the Uzynaral, with a depth of about 21 feet (6 m).

The large Ili River, flowing in from the south, spills into the western part of the lake, and it contributed 80–90 percent of the total influx into the lake until a hydroelectric project reduced the volume of the river's inflow late in the 20th century. Only such small rivers as the Karatal, Aksu, Ayaguz, and Lepsa feed the eastern part of the lake. With almost equal areas in both parts of the lake, this situation creates a continuous flow of water from the western to the eastern section. The water of the western part was almost fresh and suitable for industrial use and consumption, but that of the eastern part has long been salty.

The north banks of the lake are high and rocky, with clear-cut traces of ancient terraces. The south banks are low and sandy, and wide belts of them are covered with thickets of reeds and numerous small lakes. These low-lying banks are periodically flooded by the waters of the lake.

Harsh climatic conditions prevail, and the warm summers and cold winters significantly affect the whole regime of the lake. The average annual water temperature in the western part of the lake is 50° F (10° C); in the eastern part it is 48° F (9° C). Average precipitation is approximately 17 inches (430 mm). The lake remains frozen from the end of November to the beginning of April.

Carbonates predominate in the ground deposits of the lake. The fauna of the lake was formerly rich but declined from the 1970s owing to the lake's deteriorating water quality. Before these declines began, 20 species of fish inhabited the lake, of which six were peculiar to the lake itself. The remainder had been introduced to the lake and include the sazan, sturgeon, eastern bream, pike, and Aral barbel. The main food fish were the sazan, pike, and Balkhash perch.

The economic importance of Lake Balkhash had greatly increased during the first part of the 20th century. Most significant was the fishing and fish breeding begun in the 1930s. A regular shipping service with a large freight turnover also developed. Also of great economic significance to the region was the construction of the Balkhash copper-refining plant, around which the large city of Balkhash grew on the north shore of the lake. However, in 1970 the Kapchagay hydroelectric-power station began operations on the Ili River. The diversion of water to fill the Kapchagay reservoir and to provide for irrigation reduced the flow of the Ili River by two-thirds and caused a decline in the lake's water level. The surface of Lake Balkhash dropped 7 feet (2.2 m) between 1970 and 1987. The lake has become increasingly saline and has also suffered pollution from the leakage of fuel-storage depots and from copper mining and processing along its shores. Much of the catch from the fishing industry is now quarantined, and the forest and wetland habitats around the lake have shrunk.

ball, spherical or ovoid object for throwing, hitting, or kicking in various sports and games. The ball is mentioned in the earliest recorded literatures and finds a place in some of the oldest graphic representations.

Some form of ball game is portrayed on early Egyptian monuments. Even among the Romans, who disliked participation sports,

ball play was extremely popular. The Roman baths set aside an apartment for ball play, and many gentlemen had ball courts in their private villas. The ancient Roman ball was usually made of leather strips sewn together and filled with various materials. The smallest, the *harpastum*, was a hard ball stuffed with leathers. The largest, the *foliis*, contained an air-filled bladder, similar to a modern soccer ball or basketball.

In many early games the ball was simply thrown back and forth among a group of individuals, but there were also genuine team games and competitions among the ancient Greeks. Ball games were especially popular at Sparta.

One early Greek game known as *episkyros* involved two teams of equal numbers. Between them a white line was laid out, and, at some distance behind each team, another line was marked. The play consisted in throwing the ball back and forth until one team in the exchange was finally forced back over its rear line.

Ball playing also is of great antiquity in western Europe, and an early form of lacrosse was well established among the American Indians before Christopher Columbus sailed the Atlantic.

As skills required in games using the ball alone, and more particularly in games involving the use of various implements for striking it, were developed and refined, balls became specialized and available in a multiplicity of types. The weight and circumference of various balls have been changed over the years as the other equipment and rules of the individual sports have changed in order to increase the interest of the spectators. An example is the change made in the American football, with the popularization of the forward pass, from the egg-shaped rugby ball to a more

Greek ball players, relief on a statue base from Athens, about 510 BC; in the National Archaeological Museum, Athens

elongated shape that was easier to throw with accuracy. This variation changed the sport from a running game to one in which the forward pass also played an exciting role.

Ball, Albert (b. Aug. 21, 1896, Nottingham, Nottinghamshire, Eng.—d. May 7, 1917, Annoeullin, near Lens, Fr.), British fighter ace during World War I who achieved 43 victories in air combat.

Ball was educated at Trent College, which he left in 1913. On the outbreak of World War I, he joined the army. During the summer of 1915 he learned to fly at his own expense at Hendon, Middlesex, obtaining his pilot's certificate in October 1915, and transferred to the Royal Flying Corps. Having served in France as an army cooperation pilot from February 1916, he was posted in June to No. 11 fighter squadron (flying Nieuport Scout airplanes) and later to No. 60 and 56 squadrons (flying S.E.5s). In spite of his skill and daring, Captain Ball was shot down and killed over Annoeullin, near Lens, in 1917, possibly by gunfire from the ground, but exactly how he was killed is not definitely known. He won

the Victoria Cross, as well as numerous other honours.

Ball, Sir Alexander John, 1ST BARONET (b. 1757, Gloucestershire, Eng.—d. Oct. 25, 1809, Malta), rear admiral, a close friend of

Sir Alexander Ball, detail of an oil painting by H.W. Pickersgill; in the National Maritime Museum, Greenwich Hospital Collection

Admiral Lord Nelson, who directed the blockade of Malta (1798–1800) and served as civil commissioner (governor) of the island (1802–09).

Ball served under Admiral Sir George Rodney in the West Indies and was present at Rodney's great victory over the French off Dominica (April 12, 1782). Promoted to captain in 1783, Ball did not receive his first command until 1790. On May 20, 1798, he saved Lord Nelson's flagship from running ashore after being dismasted in a storm, and the two became close friends.

On Feb. 9, 1799, while he was blockading Malta, the island's legislature elected him president and commander in chief. After the French had surrendered Malta (September 1800), the British Admiralty withheld Ball

from naval service, despite Nelson's plea in his favour. He was created a baronet in 1801 and then was made governor of Malta, where he remained the rest of his life. He was praised highly by the poet Samuel Taylor Coleridge, who was his secretary on Malta in 1804.

Ball, Hugo (b. Feb. 22, 1886, Pirmasens, Ger.—d. Sept. 14, 1927, St. Abbondio, Switz.), writer, actor, and dramatist, a harsh social critic, and an early critical biographer of German novelist Hermann Hesse (*Hermann Hesse, sein Leben und sein Werk*, 1927; "Hermann Hesse, His Life and His Work").

Ball studied sociology and philosophy at the universities of Munich and Heidelberg (1906–07) and went to Berlin (1910) to become an actor. He was a founder of the Dadaist movement in art.

A staunch pacifist, Ball left Germany during World War I and moved to neutral Switzerland (1916). His more important works include *Kritik der deutschen Intelligenz* (1919; "Critique of German Intelligence") and *Die Flucht aus der Zeit* (1927; "The Flight from Time").

Ball, John (d. July 15, 1381, St. Albans, Hertfordshire, Eng.), one of the leaders of the Peasants' Revolt in England.

A sometime priest at York and at Colchester, Ball was excommunicated about 1366 for inflammatory sermons advocating a classless society, but he continued to preach in open marketplaces and elsewhere. After 1376 he was often imprisoned, and at the outbreak of the rebellion (June 1381) he was rescued from Maidstone prison by Kentish rebels, whom he accompanied to London. There he incited a crowd at Blackheath with the popular text "When Adam dalf [dug] and Eve span [spun], Who was then a gentleman?" An account in the *Anonimalle Chronicle* by a witness of the London events states that he urged the killing of lords and prelates.

After the rebellion collapsed, Ball was tried and hanged at St. Albans. Knowledge of his career comes almost entirely from prejudiced chroniclers. Jean Froissart calls him the mad priest of Kent. Ball is the subject of William Morris' romance *The Dream of John Ball*.

Ball, Lucille, in full LUCILLE DÉSIRÉE BALL (b. Aug. 6, 1911, Celoron, near Jamestown, N.Y., U.S.—d. April 26, 1989, Los Angeles, Calif.), radio and motion-picture actress and

Lucille Ball and Desi Arnaz

Photofest

longtime comedy star of American television. Her program *I Love Lucy* was a situation-comedy series first telecast by the Columbia Broadcasting System (CBS) on Oct. 15, 1951. In various guises it was broadcast until 1957, and again in 1962–68 and 1968–74.

Young Lucille set her mind early on a theatrical career and at age 15 gravitated to Manhattan, where she enrolled in a drama school and worked in various odd jobs. She took up modeling, which, after several years, led to minor roles in motion pictures, beginning in 1933, mostly at RKO studios. After a decade of this, more substantial parts materialized. In 1947 she took the part of a harebrained housewife in a radio series on CBS, and this brought her wide notice.

In 1940 Ball married a popular bandleader, Desi Arnaz (1917–86). She later helped create the television comedy series *I Love Lucy*, in which she and Arnaz played a husband and wife constantly beset by outlandish encounters and mishaps. The show was extremely popular, both in its network run and in reruns, and its influence on the situation comedy was felt for years thereafter.

Ball, Thomas (b. June 3, 1819, Charlestown, Mass., U.S.—d. Dec. 11, 1911, Montclair, N.J.), sculptor whose work had a marked influence on monumental art in the United States, especially in New England.

Ball began his career as a wood engraver and miniaturist. An accomplished musician, he fashioned many early cabinet busts of musicians. Among his best-known works are an equestrian statue of George Washington (Public Garden, Boston) and the Lincoln "Emancipation" group (Washington, D.C.). He published his autobiography, *My Threescore Years and Ten*, in 1891.

ball-and-socket joint, also called **SPHEROIDAL JOINT**, in vertebrate anatomy, a joint in which the rounded surface of a bone moves within a depression on another bone, allowing greater freedom of movement than any other kind of joint. It is most highly developed in the large shoulder and hip joints of mammals, including humans, in which it provides swing for the arms and legs in various directions and also spin of those limbs upon the more stationary bones.

To make the best use of the Britannica, consult the INDEX first

ball bearing, one of the two members of the class of rolling, or so-called antifriction, bearings (the other member of the class is the roller bearing). The function of a ball bearing is to connect two machine members that move relative to one another in such a manner that the frictional resistance to motion is minimal. In many applications one of the members is a rotating shaft and the other a fixed housing.

There are three main parts in a ball bearing: two grooved, ringlike races and a number of balls. The races are of the same width but different diameters; the smaller one, fitting inside the larger one and having a groove on its outside surface, is attached on its inside surface to one of the machine members. The larger race has a groove on its inside surface and is attached on its outside surface to the other machine member. The balls fill the space between the two races and roll with negligible friction in the grooves. The balls are loosely restrained and separated by means of a retainer or cage.

The most common ball bearing, with one row of balls, is usually classified as a radial ball bearing, but its capacity for carrying an axial, or thrust, load may exceed its radial capacity. The angular-contact bearing has one side of the outer-race groove cut away to allow the insertion of more balls, which enables the bearing to carry large axial loads in one direction only. Such bearings are usually used in pairs so that high axial loads can be carried in both directions. The clearances in a single-row ball bearing are so small that no appreciable misalignment of a shaft relative to a housing can be accommodated. One type of self-aligning bearing has two rows of balls and a spherical inner surface on the outer race. For pure thrust loads there are ball thrust bearings that consist of two grooved plates with balls between. The outstanding advantage of a ball bearing over a sliding bearing is its low starting friction. At speeds high enough to develop a load-carrying oil film, however, the friction in a sliding bearing may be less than in a ball bearing.

ball cactus, any of 25 species of the genus *Notocactus*, family Cactaceae, native in grasslands of South America. Small, globose to cylindroid, they are commonly cultivated as

Ball cactus (*Notocactus*)

G E Nicholson

potted plants. *N. scopa* and *N. leninghausii*, silver ball and golden ball cacti respectively, are most common and are valued for their woolly hair. These and other hairy *Notocactus* species have small, often yellow to red flowers, sometimes only about 1 centimetre (1/2 inch) in diameter. Another group, not hairy, has larger flowers, to about 6 cm.

ball lightning, also called **GLOBE LIGHTNING**, aerial phenomenon that occurs as a moving luminous sphere several inches in diameter. It usually occurs near the ground during thunderstorms, may be red, orange, or yellow in colour, and is often accompanied by a hissing sound and distinct odour. It lasts only a few seconds and dies out suddenly, either silently or explosively. Ball lightning has been observed to cause damage by burning or melting. Its relation, if any, to common lightning is uncertain. Its causes are unknown, but among the explanations of ball lightning are the following: air or gas behaving abnormally; high-density plasma; an air vortex containing luminous gases; and microwave radiation within a plasma shell.

Balla, Giacomo (b. July 24, 1871, Turin, Italy—d. March 1958, Rome), artist and founding member of the Futurist movement in painting.

Balla studied art in Paris, where he was greatly influenced by the Pointillist painters. Settling in Rome in 1901, he gradually came under the influence of the Milanese poet Filippo Marinetti. In 1909 Marinetti launched the literary movement he called Futurism, an attempt to revitalize Italian culture by embracing the power of modern science and

"Dynamism of a Dog on a Leash," oil on canvas by Giacomo Balla, 1912; in the Buffalo Fine Arts Academy

technology. In 1910 Balla and other Italian artists published the "Technical Manifesto of Futurist Painting," which adopted Marinetti's principles and urged painters to use art as a weapon to destroy the old social and cultural order.

Unlike most Futurists, Balla was a lyrical painter, unconcerned with modern machines or violence. "The Street Light—Study of Light" (1909; Museum of Modern Art, New York City), for example, is merely a dynamic depiction of light. In later works, such as "Dynamism of a Dog on a Leash" (1912; Buffalo Fine Arts Academy, Buffalo), he established as his main concerns the principle of simultaneity (the rendering of motion by simultaneously showing many aspects of a moving object) along with the abstract treatment of rhythm, light, and colour.

During World War I Balla began to compose paintings with large, simple planes of colour. After World War I he remained faithful to the Futurist style long after its other practitioners had abandoned it. Gradually, however, he reverted to a more traditional style.

Ballaarat (Australia): see Ballarat.

ballad, form of short narrative folk song the distinctive style of which crystallized in Europe during the late Middle Ages. The ballad has been preserved as a musical and literary form up to modern times.

A brief treatment of the ballad follows. For full treatment, see **MACROPAEDIA: Literature, The Art of**.

Typically, the folk ballad (or standard ballad) tells a compact tale in a style that achieves bold, sensational effects through deliberate starkness and abruptness. Despite a rigid economy of narrative, it employs a variety of devices to prolong highly charged moments in the story and to thicken the emotional atmosphere, the most common being a frequent repetition of some key word, line, or phrase. Any consequent bareness of texture finds ample compensation in this dramatic rhetoric.

Because ballads have thrived among unlettered people, and are freshly created from memory at each performance, they are subject to constant variation in both text and tune; tradition has preserved them by re-creation, not by ossification. They exhibit fascination with supernatural happenings; with the fate of lovers (usually, though not always, tragic); with crime and its punishment; with apocryphal legends (the chief stuff of religious balladry); with historical disasters (usually matters of regional rather than national importance); with sensational acts of God and man; with the deeds of outlaws and badmen; and with the hazards of such occupations as seafaring and railroading.

The ballad genre in its present form can scarcely have existed before about 1100. The oldest ballad in Francis Child's definitive compilation, *The English and Scottish Popular Ballads* (1882–98), dates from 1300, but as an oral form the ballad did not need to be written down in order to be performed or preserved. Indeed, to ask for the date of a ballad displays a misunderstanding of the very nature of balladry. Behind each recorded ballad can be detected the workings of tradition upon some earlier form of the same work.

Some scholars have argued that ballads are the result of collective composition (the "communal school," led by F.B. Gummere and G.L. Kittredge), others that each is the work of an individual composer (the "individualist school," led by W.J. Courthope, Andrew Lang, Louise Pound). The tunes are based on the modes of medieval plainsong, not on the chromatic scales of modern music, and most consist of 16 bars with two beats per measure. Musical variation, however, is as frequent as textual variation, and since the singer performs solo, or plays the accompanying instrument, the performance need not keep rigidly to set duration or stress, and the balladeer may introduce grace notes to accommodate hypermetric syllables and may lengthen notes for emphasis.

There are significant balladries in England, Scotland, Ireland, the United States, France, Denmark, Germany, Russia, Greece, and Spain. Their formal characteristics vary from one area to another: British and U.S. ballads, for instance, are invariably rhymed and divided into stanzas (strophes). The Russian ballads (*byliny*) are unrhymed and unstrophic; the Spanish *romances* and the Danish *viser* employ assonance rather than rhyme, but the latter are strophic while the former are not.

In addition to folk ballads, other types may be mentioned that are more properly relevant to the history of poetry than to that of true balladry. Minstrel ballads call attention to themselves and to the performer in a way quite foreign to the strict impersonality of the folk ballads and are the work of professional

entertainers employed in wealthy households from the European Middle Ages until the 17th century. Many of these pieces glorify noble families. The older Robin Hood ballads, celebrating traditional yeoman virtues, are also examples of minstrel propaganda. Broadside ballads are urban adaptations of the folk ballad commemorating some sensational item of topical interest. They appeared on crudely printed handbills, called broadsheets or broadsides, in the 16th to 19th century. Sophisticated imitations of such ballads, usually penned for purposes of jocular satire, were popular in the 18th and 19th centuries. The modern literary ballad recalls in its rhythmic and narrative elements the traditions of folk balladry.

ballad horn (musical instrument): *see* melophone.

ballad opera, characteristic English type of comic opera, originating in the 18th century and featuring farcical or extravaganza plots. The music was mainly confined to songs or interludes interspersed in spoken dialogue. It was based at first on ballads or folk songs to which new words were adapted; later, tunes were borrowed from popular operas, or music was occasionally newly composed.

One of the earliest and the most famous of ballad operas is *The Beggar's Opera* (1728), which is at once a spoof on Italian serious opera and a satire on the morality of contemporary politicians. Its text is by John Gay, with music adapted by John Pepusch. It had many imitators. Other composers adapting or writing music for ballad operas included Thomas Arne, Charles Dibdin, Stephen Storace, and, in the 19th century, Sir Henry Bishop.

The ballad opera developed into the light opera of W.S. Gilbert and Arthur Sullivan and, indirectly through musical comedy, into the modern musical. It also influenced the evolution of the similar German *Singspiel* in the 18th century. Several early ballad operas were successfully revived in the 20th century. Modern works directly influenced by the ballad opera include Ralph Vaughan Williams' opera *Hugh the Drover*.

ballad revival, the interest in folk poetry evinced within literary circles, especially in England and Germany, in the 18th century. It represented a new discovery and appreciation of the merits of popular poetry, formerly ignored or despised by scholars and sophisticated writers. The trend that began in England in 1711 with the publication of Joseph Addison's three *Spectator* papers cautiously defending "the darling Songs of the common People" crystallized in 1765 with the publication of Thomas Percy's *Reliques of Ancient English Poetry*, a collection of English and Scottish traditional ballads. The *Reliques* and a flood of subsequent collections, including Sir Walter Scott's *Minstrelsy of the Scottish Border* (1802), had great impact and provided the English Romantic poets with an alternative to outworn Neoclassical models as a source of inspiration. The impact was not reciprocal; literary ballads had no effect on the art or production of oral balladry. In Germany the philosopher-critic Johann Gottfried von Herder conferred an almost mystical distinction on the ballad as the genuine expression of the spirit of the folk. The collection of lyrical and narrative folk songs *Des Knaben Wunderhorn* (1805–08; "The Boy's Magic Horn"), edited by Clemens Brentano and Achim von Arnim, was the dominant influence on German poetry throughout the 19th century.

ballade, one of several *formes fixes* ("fixed forms") in French lyric poetry and song, cultivated particularly in the 14th and 15th centuries (*compare* *rondeau*; *virelai*). Strictly, the

ballade consists of three stanzas and a shortened final dedicatory stanza. All the stanzas have the same rhyme scheme and the same final line, which thus forms a refrain (R). Each of the three main stanzas is built in three sections, the first two of which have the same rhyme scheme. The total form can be expressed:

I	II	III	E
a a b R	a a b R	a a b R	b R

The final dedicatory stanza is called the *prince* (because that is usually its first word), or the *envoi*. The *chanson royale* is similar to the ballade but has five main stanzas.

The general shape of the ballade is present in the poetry of many ages. The odes of the Greek poet Pindar (5th century BC) have the same stanza form with their strophe, antistrophe, and epode. Much of the art song of the 16th century in Germany is cast in a similar form, though normally without the *envoi* or the refrain line; when in Richard Wagner's music drama *Die Meistersinger* (1868) Fritz Kothner defines a *Bar* (a poetic form) as consisting of several *Gesetze* ("stanzas"), each made up of two *Stollen* (*a a*) and an *Abgesang* (*b*), he is accurately describing a historical reality. But in its purest form the ballade is found only in France and England.

The immediate precursors of the ballade can be found in the songs of the troubadours (poet-musicians using the Provençal language), which frequently employ the *a a b* stanza pattern with an *envoi*. They normally have more than three stanzas, however, and the refrain line, if there is one, is often not the last line of the stanza. In the later 13th century the standard form appears more and more frequently in the French songs of the *trouvères* (the northern counterparts of the troubadours).

The songs of the *trouvères* and troubadours are monophonic (having one melody line or voice part). The history of the polyphonic ballade begins with Guillaume de Machaut, the leading French poet and composer of the 14th century. In his work can be seen the gradual emergence of a standard manner of setting a ballade and in particular the convention of closing the second *a* section with a musical epilogue that is repeated at the end of the stanza.

The ballade was the most expansive of the *formes fixes*, and Machaut used it to express the loftiest emotions. The texts more often contained elaborate symbolism and classical references than did those of the other *formes fixes*. Later in the 14th century, the ballade was used for the most solemn and formal songs: the celebration of special patrons, the commemoration of magnificent occasions, the declarations of love in the highest style.

In the 15th century the form became less popular. The foremost Burgundian composer, Guillaume Dufay, wrote few ballades, almost all of which can be connected with specific occasions and all early in his life. Later in the century, musical ballades are rare except in the work of English composers. Among the two greatest songwriters of the later 15th century, Antoine Busnois wrote no ballades, and Jean d'Ockeghem wrote just one—on the occasion of the death of another famed song composer, Gilles Binchois, in 1460.

The form gradually disappeared among the poets, too, only to reappear spasmodically in the work of later writers as a conscious archaism. But there are fine examples from the 15th century among the work of Alain Chartier, Charles d'Orléans, and Molinet; and François Villon's best-known poem is a ballade with the refrain line "Mais où sont les neiges d'antan?" ("But where are the snows of yester-year?").

Balladur, Édouard (b. May 2, 1929, İzmir [Smyrna], Turkey), French neo-Gaullist politi-

cian, who served as prime minister from 1993 to 1995.

Balladur graduated from the prestigious National School of Administration in 1957 and went to work for the Council of State as a junior official. In 1962 he joined the Office of Radio and Television Broadcasting (ORTF). The head of ORTF recommended him to Prime Minister (later President) Georges Pompidou, and during the 1960s and '70s Balladur was a member of Pompidou's staff. After Pompidou's death in 1974, Balladur worked in industry, becoming chairman of two subsidiaries of the national electric company.

From 1984 to 1988 Balladur served as councillor of state, and he was an adviser to Jacques Chirac, the leader of the neo-Gaullist party Rally for the Republic (RPR). In 1986 Balladur was elected to the National Assembly as deputy for Paris, but he gave up his seat to join newly appointed Prime Minister Chirac's cabinet as minister of economy, finance, and privatization. A political moderate, Balladur had helped develop the formula for "cohabitation," the sharing of power between Socialist President François Mitterrand and Chirac's conservative government. As finance minister he launched an ambitious privatization program; oversaw the easing of controls on prices, capital, and labour; and supported the introduction of a single European currency.

Chirac's government left office in 1988, and Balladur was reelected to the National Assembly. In March 1993, after conservatives won an overwhelming majority in the National Assembly, President Mitterrand appointed Balladur as prime minister. In 1995 Balladur ran for the presidency. Placing third in the first round of voting after Lionel Jospin, the Socialist Party candidate, and Chirac, his former mentor, he threw his support to Chirac, who then won the election.

Ballance, John (b. March 27, 1839, Glenavy, County Antrim, N.Ire.—d. April 27, 1893, Wellington, N.Z.), prime minister of New Zealand (1891–93) who unified the Liberal Party and played a major role in the enactment of social welfare legislation.

After working as an ironmonger in Birmingham, Eng., the self-educated Ballance emigrated to Wanganui, N.Z., in 1865. There he was editor of the *Wanganui Herald* and fought against the native Maoris. Entering Parliament in 1875, he advocated abolition of provincial governments. As colonial treasurer in 1878, he introduced a land tax to raise revenue more equitably. As minister of lands, defense, and native affairs in 1884–87, he tried to shift landownership from monopolists to small farmers and to retain crown land while preventing abuses in the sale of Maori land.

During his term as prime minister, Ballance imposed progressive land and income taxes and gained for the government the right to repurchase private land for development. He combated the lingering depression by limiting government borrowing and won reduction of life membership in the upper house to a seven-year term, curtailing the power of his opponents. His cabinet was noted for its distinguished ministers, including William Pember Reeves, who sponsored pioneering labour-protection legislation; John McKenzie, who fought against land monopolies; and Ballance's successor, Richard John Seddon.

Ballanche, Pierre-Simon (b. Aug. 4, 1776, Lyon, France—d. June 12, 1847, Paris), religious and social philosopher who influenced the Romantic writers and played an important part in the development of French thought in the early decades of the 19th century. The Romantics were attracted by his rejection of 18th-century rationalism and by the poetic and oracular style in which he expressed his religious and social theories.

Basically a Roman Catholic, Ballanche read widely among the mystical authors of the past

Ballanche, portrait by an unknown artist

By courtesy of the Bibliotheque Nationale Paris

and of his own time. In *Du sentiment considéré dans ses rapports avec la littérature et les arts* (1801: "Sentiment Considered in Its Relationship to Literature and the Arts"), he expressed views on the role of religious emotion in art that foreshadow François-Auguste-René Chateaubriand's influential landmark of Romanticism, *Le Génie du christianisme* (1802; "The Genius of Christianity"). In the post-French Revolutionary era he reconsidered the basis and functions of human society in the light of his religious opinions.

Ballantyne, John: see Bellenden, John.

Ballarat, also spelled BALLAARAT, city, central Victoria, Australia, on the Yarrowee River. The area was first settled in 1838 by sheepherders and developed rapidly after the discovery of rich alluvial gold deposits in 1851. In 1854, two years after its founding, Ballarat (its name was derived from two Aboriginal words meaning "resting place") was the scene of an armed rebellion known as Eureka Stockade, in which about 25 miners, demanding political reform and the abolition of licenses, were shot down by the military; the incident is commemorated by a memorial. The town became a municipality in 1855, a borough in 1863, and a city in 1870.

A rail and road centre, Ballarat is one of the most populous inland cities of Australia and includes the borough of Sebastopol and portions of the shires of Ballarat, Bungaree, Buninyong, and Grenville. It serves an agricultural and pastoral district. Although the alluvial gold was soon exhausted, underground mining continued until 1918. Manufacturing concerns produce woolens, agricultural and industrial machinery, bricks, chemicals, and furniture. Many public buildings date from the 1860s and '70s, and there are Anglican and Roman Catholic cathedrals, a school of mines and industries, a botanical garden hosting an annual begonia festival, and a historical museum. Almost 20 percent of the city's area (including Lake Wendouree) is in recreational use. Cultural resources include the Ballarat College of Advanced Education, founded in 1967. Pop. (1991 prelim.) 78,347.

Ballard FAMILY (fl. from mid-16th to mid-18th century, France), printers who from 1560 to 1750 virtually monopolized music printing in France.

The founder of the dynasty was Robert Ballard (d. 1588), brother-in-law to the celebrated lutenist and composer Adrian Le Roy. These two used movable type, cut in 1540 by Robert's father-in-law, Guillaume Le Bé (or du Gué). Their first patent was granted in 1552 as sole music printers to Henry II. Robert's widow and his son, Pierre (d. 1639), continued the business, and further patents were obtained from Henry IV and Louis XIII. Robert's grandson Robert II ran the firm from 1640 to 1679. He was succeeded by Christophe (d. 1715), Jean-Baptiste-Christophe (d. 1750), Christophe-Jean-François (d. 1765), and Pierre-Robert-Christophe (d. 1812), who carried on management until 1788. Throughout the

history of the printers, the women of the family were often as active in the business as the men.

Ballard publications, both those with the early movable type and the later ones engraved on copper plates, were noted for their beauty and care of presentation. Their title

Robert Ballard, engraving by Claude du Flos, 1713, after a portrait by Lefevre

J.P. Ziolo

pages were frequently superb examples of decorative engraving. The music published represented practically all the French composers of the period.

ballas, a variety of industrial diamond (*q.v.*).

Ballenden, John: see Bellenden, John.

ballet, theatrical dance in which a formal academic dance technique—the *danse d'école*—is combined with other artistic elements such as music, costume, and stage scenery. The academic technique itself is also known as ballet.

A brief treatment of ballet follows. For full treatment, see MACROPAEDIA: Dance, The Art of; Dance, The History of Western.

Ballet developed out of the court spectacles of the Renaissance and the subsequent French ballet de cour, in which social dances performed by royalty and aristocracy were presented in harmony with music, speech, verse, song, pageant, decor, and costume. After some years of decline in dance standards in the 17th century, Louis XIV of France (1638–1715), a great devotee of dancing himself, in his concern to "reestablish the dance in its true perfection," established the Académie Royale de Danse in 1661—the same year that the first *comédie-ballet* (with text by Molière and music by Jean-Baptiste Lully), in which dances were separated by scenes of a play, was presented. In due course, this led to Lully's *opéra-ballets* and the establishment of a school to train professional dancers for them, attached to the Académie Royale de Musique (or the Opéra). The new professionals were trained in dance as a mirror of noble deportment and manners. With the guidance of Lully and the ballet master Pierre Beauchamps (1631–1719), ballet emerged as a theatrical form.

The century that followed saw great advances in technical standards of ballet dancing and a new concern with ballet as a vehicle of drama. In the latter, Jean-Georges Noverre (1727–1810) was central: his *Lettres sur la danse et les ballets* (1760) was a major influence throughout Europe on the development of the ballet d'action, or dramatic ballet, in which the dancers' movements were designed to express character and to assist in the narrative. At the same time, the composer Christoph Gluck, in both opera and ballet, brought fresh vigour and drama to dance accompaniment. This was also the era of the three *genres*. According to physique, dancers were trained in different techniques—*noble*, or *sérieux*; *demi-caractère*; and *comique*, or *grotesque*. Thus stratified, ballet became a grand theatrical

form like opera, performed in opera houses, as often it still is today; many operas contained ballet divertissements (suites of ballet numbers used as interludes).

Ballet of that time still reflected aristocratic attitudes, but the industrial, social, political, and artistic revolutions of the late 18th and early 19th centuries brought great alterations. Especially in France, which was the centre of style in ballet teaching, the ancien régime and its social dances ceased to be a model for dancers. The stage dancing of the early 19th century was given new artistic purpose in the Romantic ballet, particularly with the dancing of Marie Taglioni (1804–84) and Fanny Elssler (1810–84). With the introduction of pointework (position of balance on extreme tip of toe) to the dance vocabulary, the ballerina became a supreme or ideal stage figure. Scenarios for ballets began to be devised for the first time by professional writers or librettists, a method that became general in the 19th century. With the codification of ballet technique by such teachers as Carlo Blasis (1803–78), ballet dancing reached the basic form by which it may be recognized today—one essentially separate from social dance.

After the widespread enthusiasm for the Romantic ballet between 1830 and 1850, however, the art became regionalized with little international cross-fertilization. Artistic standards declined except in Russia and Denmark. Ballet masters such as August Bournonville (1805–79), Jules Perrot (1810–92), and Marius Petipa (1818–1910) gave new choreographic presentations of ballet. Petipa in particular helped to bring academic ballet to a new height in St. Petersburg in the last decades of the century, producing, to Peter Ilich Tchaikovsky's music, such enduring classics of the repertory as *The Sleeping Beauty* and, with his assistant Lev Ivanov (1834–1901), *Swan Lake*.

The 20th century saw Russia spreading ballet across the Western world to enormous acclaim and influence. Anna Pavlova (1881–1931), supreme ballerina, toured the world for 20 years; and the Ballets Russes of Sergey Diaghilev (1872–1929), appearing in Europe for the last 20 years of his life, brought a new intensity of collaboration between choreographer, designer, and composer.

Diaghilev's influence on artists and audiences was immense. His five main choreographers—Mikhail Fokine (1880–1942), Vaslav Nijinsky (1888–1950), Leonide Massine (1895–1979), Bronislava Nijinska (1891–1972), and George Balanchine (1904–83)—all made major contributions to his work of revitalizing and redefining the art of ballet. The full-length ballet gave way to the one-act form; ballets could be plotless or could take the modern world as their subject. They could be set to arrangements of music not intended for dance or to commissioned scores with unconventional rhythms, harmonies, or everyday noises.

After the death of Diaghilev and with the emergence of other Ballets Russes companies in his wake, there were new steps taken to establish ballet in the West. New schools and companies were set up in order to give the art national identity and academic discipline. In Great Britain the Vic-Wells (later Sadler's Wells, then Royal) Ballet, founded in 1931 and directed by Ninette de Valois (b. 1898), with Sir Frederick Ashton (b. 1904) as resident choreographer, quickly achieved national importance; in the United States the School of American Ballet and the attached New York City Ballet, founded, respectively, in 1934 and 1948 and directed by Lincoln Kirstein (b. 1907) and the choreographer Balanchine, acquired comparable stature.

After World War II the Royal Danish Ballet and especially the Kirov and Bolshoi ballets of Leningrad and Moscow made tours abroad,

having a profound impact. Today, many countries have ballet companies and schools, and ballet is an artistic entertainment for the general public. The art is even more complex and diverse than it was in Diaghilev's day, incorporating dance styles of all kinds into the *danse d'école* and collaborating with other arts in diverse ways. Within this diversity, though, some degree of the measured grace and light, effortless movement of its aristocratic ancestor still distinguished ballet from other forms of dance.

Ballet comique de la reine, court entertainment that is considered the first ballet. Enacted in 1581 at the French court of Catherine de Médicis by the Queen, her ladies, and the nobles of the court to celebrate the betrothal of her sister, it fused the elements of music, dance, plot (the escape of Ulysses from Circe), and design into a dramatic whole.

It is also the first ballet of which there is a printed account (libretto); it was published in 1582 as the *Balet comique de la royne* by Balthazar de Beaujoyeux, who had conceived and staged the ballet as Catherine's director of court festivals. The *Ballet comique* was a brilliant success, and Beaujoyeux's volume circulated to the courts of Europe, influencing the development of court ballet in France and the masque in England.

ballet d'action, ballet in which all the elements of production (e.g., choreography, set design, and costuming) are subordinate to the plot and theme. John Weaver, an English ballet master of the early 18th century, is considered the originator of pantomime ballet, a drama in dance form that became formalized as the classical ballet d'action later in the century. The choreographers Angiolini, Franz Hilverding, van Wewen, and especially Noverre became its advocates. Noverre's *Lettres sur la danse, et sur les ballets* (1760) is the authoritative work on the ballet d'action.

ballet movement, in classical ballet, any of the formalized actions of a dancer that follow specific rules regarding the positions of the arms, feet, and body. Ballet choreography is based on combinations of these fundamental movements. Some movements, like the *plié* and *battement*, are training exercises designed to give strength and flexibility to the entire body while helping the dancer acquire perfect posture, or "placement," with the weight lightly balanced over the centre of gravity and the legs turned out from the hip sockets. Other movements are steps in a ballet. These may be jumping or leaping steps (*pas d'élévation*), like the *entrechat* (a jump beginning and ending in the fifth position, during which the feet are rapidly crossed) or the *jeté* (a jump in which the weight is transferred from one foot to the

other); or they may be turns (*tours*), such as the *pirouette* (a turn on one foot) and the *tour en l'air* (a complete single, double, or triple, turn in the air).

See also *assemblé*; *battement*; *brisé*; *cabriole*; *entrechat*; *fouetté en tournant*; *glissade*; *jeté*; *pas d'élévation*; *pirouette*; *plié*; *tour en l'air*.

ballet position, any of the five positions of the feet fundamental to all classical ballet. The term may also denote the various poses of the body. First used by Thoinot Arbeau in 1588, codified by Pierre Beauchamp c. 1680, and set down by Pierre Rameau in *Le Maître à danser* (1725; *The Dancing Master*, 1931), the positions are the starting and ending points for the intricate ballet movements (q.v.).

In all positions each leg is turned sideways from the hip, so that the toes extend out to each side and the feet form straight or parallel lines on the floor. Body weight is evenly distributed over both feet, which can either remain flat on the floor, rest on the balls of the feet (*demi-pointe*), or rest on the toes (*pointe*; women only). Corresponding positions of the arms and hands (*port de bras*) complete the perfect balance of the figure.

Arabesque executed by Natalya Bessmertnova, with Nikolay Fadeychev, of the Bolshoi Ballet; *Swan Lake* Novosti—Sovfoto

In the first position, the heels are together, with toes turned out until the feet are in a straight line. In the second position, the feet are in a parallel line, separated by a distance of about 12 inches (30 cm) and both turned outward, with the weight equally divided between them. In second position *en l'air* ("in the air"), the weight is supported by one foot while the other is raised at the side. In the third position, the heel of one foot rests against the instep of the other; both are firmly turned out, and the weight is divided between them. Used extensively in 18th-century social dances such as the minuet and gavotte, this position has almost disappeared from theatrical usage.

In the fourth position, one foot rests about 12 inches in advance of the other, both are turned out, and the weight is divided between

Attitude executed by Diana Weber of the American Ballet Theatre Martha Swope

them. Like the second position, fourth has its equivalent *en l'air*. In the fifth position, the feet are turned out and pressed closely together, the heel of the one foot against the toe of the other.

In addition to the five fundamental positions of the feet, there are two major body positions in classical ballet. The arabesque is a body position in which the weight of the body is supported on one leg, while the other leg is extended in back with the knee straight. One of the most graceful of ballet positions, the arabesque can be varied in many ways by changing the position of the arms, the angle of the body, and the height of the leg in the air. The dancer's body may be supported on the full foot, the ball of the foot (*demi-pointe*), or toe (*pointe*; women only), and the supporting leg may be straight or bent.

The attitude is a position similar to the arabesque except that the knee of the raised leg is bent. The raised leg is held at a 90° angle to the body in back or in front (*attitude an avant*); the knee may be either well bent or nearly straight (*attitude allongée*). The supporting leg also may be straight or bent. As in the arabesque the body may be supported on the full foot, the ball of the foot, or the toe. The pose was first described in 1829 by Carlo Blasis, who was inspired by the statue of Mercury by Giambologna.

Ballet Rambert, oldest existing ballet company in England. Since the 1930s the Ballet Rambert has been an important training ground for young talent; among the famous artists who gained early experience with the company were the dancers Alicia Markova and Margot Fonteyn and the choreographers

Ballet positions (From left to right): First, second, third, fourth, and fifth positions Martha Swope

Antony Tudor, Sir Frederick Ashton, Agnes deMille, Andrée Howard, Walter Gore, and Peggy van Praagh.

Inspired by Dame Marie Rambert, a former dancer with Diaghilev, the Rambert Dancers (performing from 1926) and the Ballet Club (established in 1930) staged small-scale Sunday afternoon productions that were mainly new ballets by unknown choreographers. During World War II the company toured factories, military camps, and outlying areas and later staged seasons in major London theatres. Its postwar tours include one of Australia and New Zealand (1947–48) that greatly stimulated interest there in ballet. The Ballet Rambert is a small company; in 1966 its repertoire was reformed to make it almost exclusively a forum for young talent. John Chesworth was appointed artistic director in 1974.

Ballet Russe de Monte Carlo, ballet company founded in Monte-Carlo in 1932. The name Ballets Russes had been used by the impresario Sergey Diaghilev for his company, which revolutionized ballet in the first three decades of the 20th century. Under the direction of Colonel W. de Basil, the Ballet Russe de Monte Carlo brought to audiences new compositions by Léonide Massine and George Balanchine, with such dancers as Aleksandra Danilova, Leon Woizikowki, and David Lichine. Ballet Russe de Monte Carlo divided into new competitive companies in 1938, one under de Basil, the other under Massine.

De Basil renamed his company the Royal Covent Garden Ballet Russe and finally the Original Ballet Russe (1939); the company toured internationally before dissolving in 1947.

Massine, with René Blum, formed another Ballet Russe de Monte Carlo with the dancers Danilova, Tamara Toumanova, Dame Alicia Markova, Mia Slavenska, Serge Lifar, Igor Youskevitch, and André Eglevsky and new choreography by Massine. This company performed principally in the U.S., produced traditional revivals and works by U.S. choreographers, and featured U.S. dancers, including Maria Tallchief. The company declined in the 1950s and ceased producing in 1963; its ballet school was maintained in New York City for a time. Massine and Sergei Denham organized the new Ballets de Monte Carlo in 1966 under the patronage of Prince Rainier III of Monaco.

Ballet Theatre, American: *see* American Ballet Theatre.

Ballets Russes, ballet company founded in Paris in 1909 by the Russian impresario Sergey Diaghilev. The original company included the choreographer Michel Fokine and the dancers Anna Pavlova and Vaslav Nijinsky; the choreographer George Balanchine joined in 1925. Music was commissioned of Rimsky-Korsakov and Stravinsky and designs of Picasso, Rouault, Matisse, and Derain. The company was dissolved after Diaghilev's death in 1929. *See also* Diaghilev, Sergey.

balletto, in music, genre of light vocal composition of the late 16th–early 17th centuries, originating in Italy. Dancelike and having much in common with the madrigal, a major vocal form of the period, it is typically strophic (stanzaic) with each of the two repeated parts ending in a “fa-la-la” burden, or refrain. It has a clear alternation of strong and weak beats, a quality common to the lighter forms of the time, such as the *canzonetta*, *villota*, *villanesca*, and *villanella*. The term was first applied to musical compositions by the Italian Giovanni Gastoldi in 1591 in his *Balletti a cinque voci . . . per cantare, sonare, et ballare* (*Balletti in Five Voices . . . to Sing, Play, and Dance*).

Although greatly influenced by the Italian model, the English composer Thomas Morley expanded its contrapuntal and harmonic di-

mensions in his *First Booke of Balletts* (1595). Morley's style influenced not only the English composers but also the German Hans Leo Hassler and his younger contemporaries who transformed the *balletto* in the early 17th century into a more instrumental and homophonic (chordal) style. The suites of the German Johann Hermann Schein as well as later 17th-century Italian instrumental works often contain such *balletti*. Both the Italian Girolamo Frescobaldi and, in the 18th century, J.S. Bach wrote instrumental movements entitled *balletto*. The name was also given to a form of dramatic choreography popular in 15th-century Italy.

Ballia, town, administrative headquarters of Ballia district, Uttar Pradesh state, northern India, on the Ganges River, northeast of Vārānasi (Benares). An ancient settlement, it has occasionally been moved northward because of changes in the river's course. It is an administrative, trade, and business centre, with some light industry. The town houses two colleges and an annual cattle fair. Ballia is connected by rail with Vārānasi and other northern Indian cities.

Ballia district, 1,229 sq mi (3,183 sq km) in area, comprises the eastern tip of Uttar Pradesh, jutting into Bihār state. It is a wedge of alluvial plain between the Ganges and Ghāghara rivers, at their confluence. The fertile land, frequently flooded by the rivers, supports various grains, sugarcane, and other crops. Pop. (1991) town, 84,100; district, 2,262,273.

Ballina, town and port, north coastal New South Wales, Australia, at the mouth of the Richmond River. Founded (1842–43) as the shipping outlet for the river valley, it was significantly affected by a gold rush in 1860. Proclaimed a town in 1856 and a municipality in 1883, Ballina was an important timber port by the 1880s but declined when forestry waned. It now functions as an outpost for Lismore, 20 mi (30 km) upstream, and as a base for a large fishing fleet, as well as a service centre for an agricultural district (dairy produce, sugarcane, and tropical fruit). Industries include fish and fruit canneries and shipyards. Its name, derived from an Aboriginal word meaning “place where oysters are plentiful,” refers to the nearby rich oyster beds. Ballina is at the junction of the Bruxner and Pacific highways, 376 mi northeast of Sydney and 105 mi south-southeast of Brisbane. Pop. (1996) 16,056.

Ballina, Irish BÉAL AN ÁTHA, urban district, County Mayo, Ireland, on the River Moy. The town, the largest in Mayo, has a modern Roman Catholic cathedral and the remains of an Augustinian friary founded about 1375. Salmon and trout fishing nearby are notable. Hand tools, drills, and medical products are manufactured there. Pop. (1991) 6,563.

Ballinasloe, Irish BÉAL ÁTHA NA SLUAIGHE, market town and urban district, County Galway, Ireland, on the River Suck and a northerly extension of the Grand Canal. Originally a small settlement beside the medieval castle guarding the important Suck crossing, the town was developed mainly in the 18th century. It is the main market town of east County Galway and is noted for its livestock fairs, the largest in Ireland, which reached a peak in the mid-19th century. The famous local quarries supplied the masonry for a street of shop fronts in New York City. It is also an important angling centre. Pop. (1991) 5,793.

Ballinger, Richard A (chilles) (b. July 9, 1858, Boonesboro, Iowa, U.S.—d. June 6, 1922, Seattle, Wash.), U.S. secretary of the interior (1909–11) whose anti-conservationist policy contributed to the rift between the conservative and progressive factions in the Republican party.

As the reform mayor of Seattle, Wash. (1904–06), Ballinger attracted the attention of the Theodore Roosevelt administration, and in 1907 he was appointed commissioner of the General Land Office. In 1909 he became secretary of the interior in the Cabinet of Pres. William Howard Taft. During his two years in that post Ballinger sought to make public resources more available for private exploitation and became embroiled in a highly publicized controversy with Gifford Pinchot, chief of the Division of Forestry in the Department of Agriculture. Citing evidence supplied by a public-land inspector, Pinchot charged that Ballinger had cooperated with private interests in a fraudulent scheme to plunder coal reserves in Alaska. Taft supported his secretary and dismissed both Pinchot and his informant, Louis Glavis. Although a Congressional investigation exonerated Ballinger, the episode left a residue of bitterness between the conservative Republicans led by Taft and the progressives loyal to Theodore Roosevelt.

Balliol FAMILY, also spelled BALIOL, medieval family that played an important part in the history of Scotland and came originally to England from Bailleul (Somme) in Normandy. Guy de Balliol already possessed lands in Northumberland and elsewhere during the reign of William II of England (1087–1100). Guy's nephew and successor, Bernard (d. c. 1167), built Barnard Castle and was the first of his family to receive lands in Scotland. He fought against David I of Scotland at Northallerton in 1138, and with King Stephen was captured by Matilda at Lincoln in 1141. His son Bernard (d. c. 1190) was present at the capture of King William I of Scotland at Alnwick in 1174. A descendant, Hugh (d. 1228), supported King John against the baronial party in England in 1215–16.

Hugh's son and successor John (d. 1268) married in 1233 Dervorguilla, daughter of Alan, the last “Celtic” lord of Galloway, and also an heiress of King William I of Scotland. His descendants were therefore able to have royal pretensions. John served (1251–55) as guardian of the young Scottish king Alexander III. His loyalty to King Henry III of England in the Barons' War (1264–67, against rebellious nobles led by Simon de Montfort, earl of Leicester) cost him the temporary loss of his lands and a period of imprisonment after his capture in the Battle of Lewes (May 14, 1264). About that time (perhaps in 1263) he began to support several students at Oxford, apparently as penance for a quarrel with the Bishop of Durham. After his death, his widow completed his endowment of scholars, and their house was formally chartered as Balliol College in 1282.

John was succeeded in turn by his three sons, Hugh (d. 1271), Alexander (d. 1278), and John de Balliol (*see* John under John [Scotland]). This last son, John, established the Scottish royal House of Balliol, which, however, lasted only a generation, ending with the resignation of John's son Edward (*see* Edward under Edward [Scotland]).

ballista, ancient heavy missile launcher designed to hurl long arrows or heavy balls. The Greek ballista was basically a huge crossbow fastened to a mount. The Roman ballista, however, was powered by torsion derived from two thick skeins of twisted cords through which were thrust two separate arms joined at their ends by the cord that propelled the missile. The largest ballistas were quite accurate in hurling 60-pound weights up to about 500 yards. *Compare* catapult.

ballistic pendulum, device for measuring the velocity of a projectile, such as a bullet. A large wooden block suspended by two cords

serves as the pendulum bob. When a bullet is fired into the bob, its momentum is transferred to the bob. The bullet's momentum can be determined from the amplitude of the pendulum swing. The velocity of the bullet, in turn, can be derived from its calculated momentum. The ballistic pendulum was invented by the British mathematician and military engineer Benjamin Robins, who described the device in his major work, *New Principles of Gunnery* (1742).

The ballistic pendulum has been largely supplanted by other devices for projectile velocity tests, but it is still used in classrooms for demonstrating concepts pertaining to momentum and energy.

ballistics, science of the propulsion, flight, and impact of projectiles. It is divided into several disciplines. Internal and external ballistics, respectively, deal with the propulsion and the flight of projectiles. The transition between these two regimes is called intermediate ballistics. Terminal ballistics concerns the impact of projectiles; a separate category encompasses the wounding of personnel.

The gun and the rocket motor are types of heat engine, partially converting the chemical energy of a propellant into the kinetic energy of a projectile. Propellants are unlike conventional fuels in that their combustion does not require atmospheric oxygen. Within a restricted volume, the production of hot gases by a burning propellant causes an increase in pressure. The pressure propels the projectile and increases the burning rate. The hot gases tend to erode the gun bore or rocket throat.

When the charge of propellant in a gun chamber is ignited, the combustion gases are restrained by the shot, so the pressure rises. The shot starts to move when the pressure on it overcomes its resistance to motion. The pressure continues to rise for a time and then falls, while the shot is accelerated to a high velocity. The rapidly burning propellant is soon exhausted, and, in time, the shot is ejected from the muzzle: muzzle velocities up to 15 kilometres (9 miles) per second have been achieved. Recoilless guns vent gas through the rear of the chamber to counteract recoil forces.

A precursor blast, which precedes the exit of the shot, is followed by the main blast as the compressed gases behind the shot are released. The shot is briefly overtaken by the rapid gas outflow and so may suffer severe yawing. The blast shock wave, traveling outward at a speed greater than that of sound, is heard as gunfire. Heat generated near the muzzle causes flash, which in large guns is accompanied by flames. Devices can be affixed to the muzzle to suppress blast and flash by dispersing shock waves, and they can reduce recoil by deflecting the outflow.

A trajectory is the path of a shot, subject to the forces of gravity, drag, and lift. Under the sole influence of gravity, a trajectory is parabolic. Drag retards motion along the trajectory. Below the speed of sound, the drag is roughly proportional to the square of the velocity; streamlining of the shot tail is effective only at these velocities. At greater velocities, a conical shock wave emanates from the nose of the shot. The drag, which is largely dependent on the nose shape, is least for finely pointed shots. Drag can be reduced by venting gases from a burner in the tail.

Tail fins can be used to stabilize projectiles. Spin stabilization, provided by rifling, causes gyroscopic wobbling in response to aerodynamic tumbling forces. Insufficient spin permits tumbling, and too much prevents dipping of the shot nose as it traverses the trajectory. Drift of the shot arises from lift, due to yawing, meteorological conditions, and rotation of the Earth.

Rockets are propelled by reaction to the momentum of the gas efflux. The motor is designed so that the pressures generated are nearly constant during burning. Fin-stabilized rockets are sensitive to crosswinds, as resulting yaw causes thrust misalignment. Two or more motor nozzles canted from the line of flight can provide spin stabilization.

Targets are generally solid and are termed thick or thin according to whether or not the impact of the shot is influenced by underlying material. Penetration occurs when the stress intensities of impact exceed the yield stress of the target; it causes ductile and brittle failure in thin targets and hydrodynamic flow of material in thick targets. The shot may be subject to similar failure during impact. Penetration completely through the target is called perforation. Enhanced armour penetrators either detonate a squashed explosive against the target or explosively focus a jet of metal onto its surface.

Wound ballistics is mainly concerned with the mechanisms and medical implications of trauma caused by bullets and explosively driven fragments. Upon penetration, the momentum given to the surrounding tissues generates a large temporary cavity. The extent of local injury is related to the size of this transient cavity. Evidence suggests that physical injury is proportional to the projectile's velocity cubed, its mass, and its cross-sectional area. The wounding potential of a bullet is thus increased by tumbling or mushrooming upon impact. Further injury is often caused by fast-moving fragments of impacted bone. Studies of body armour seek to prevent projectile penetration and minimize injury.

ballistocardiography, graphic recording of the stroke volume of the heart for the purpose of calculating cardiac output. The heartbeat results in motion of the body, which in turn causes movements in a suspended supporting structure, usually a special table or bed on which the subject is lying, and these movements are recorded photographically (ballistocardiogram, or BCG) as a series of waves. The BCG is one of the most sensitive measures of the force of the heartbeat, and an abnormality appearing in the BCG of an apparently healthy subject aged 40, or younger, may be suggestive of symptomatic coronary disease.

ballistospore, in fungi, a spore forcibly propelled from its site. The basidiospores of the mushrooms, produced on the gills and on the walls of the spores, are ballistospores. They are shot from the vertical walls of the fruiting structure and then drift down. In other fungi, including certain slime molds, they are propelled in other directions by various mechanisms.

Ballivián, Lake, predecessor to modern Lake Titicaca, on the Bolivia-Peru border during Pleistocene times (1,600,000 to 10,000 years ago). Its surface is thought to have been at least 330 feet (100 m) above the present surface of Lake Titicaca. As the lake drained, it formed two smaller lakes: Titicaca, in the northern portion of its basin, and Minchin, predecessor to modern Lake Poopó, in the southern.

Ballon, Jean: see Balon, Jean.

balloon, large airtight bag filled with hot air or a lighter-than-air gas, such as helium or hydrogen, to provide buoyancy so that it will rise and float in the atmosphere. Transport balloons have a basket or container hung below for passengers or cargo. A self-propelled, steerable balloon is called an airship (*q.v.*), or dirigible.

Balloons were used in the first successful human attempts at flying. Experimentation with balloonlike craft may have begun as early as 1709 with the work of Bartolomeu Lourenço de Gusmão, a Brazilian priest and inventor. In 1783 Joseph and Étienne Montgolfier at

Ascent of a Piccard balloon

UPI—EB Inc

Annonay, Fr., confirmed that a fabric bag filled with hot air would rise. On June 4 of that year they launched an unmanned balloon that traveled more than 1.5 miles (2.4 km). At Versailles, they repeated the experiment with a larger balloon on Sept. 19, 1783, sending a sheep, rooster, and duck aloft.

On Nov. 21, 1783, the first manned flight took place when Jean-François Pilâtre de Rozier and François Laurent, Marquis d'Arlandes, sailed over Paris in a Montgolfier balloon. They burned wool and straw to keep the air in the balloon hot; their flight covered 5.5 miles (almost 9 km) in about 23 minutes. In December of that year the physicist J.-A.-C. Charles, accompanied by Nicolas-Louis Robert, flew a balloon filled with hydrogen on a two-hour flight.

Military uses for balloons were soon developed. Anchored observation balloons were used by Napoleon in some of his battles and by both sides in the American Civil War and in World War I. The powered airship developed from balloons, but, while the airship was eventually supplanted by the airplane, balloons have continued to find useful applications. During World War II, balloons were anchored over many parts of Britain to defend against low-level bombing or dive-bombing.

Balloons have also proved enormously valuable to science. As early as 1911–12, V.F. Hess, an Austrian physicist, made a daring series of balloon ascensions as high as 5,000 m (about 3 miles) to prove the existence of cosmic rays. Advances in weather science since 1900 have resulted in great part from intensive exploration of the upper air by instrumented free balloons, which have risen to an altitude of 30 km (19 miles). Auguste Piccard, Swiss physicist and educator, set a world's altitude record in May 1931 in a balloon of his own design, which featured the first pressurized cabin used in flight. Jean-Felix Piccard, twin brother of Auguste, experimented with plastic balloons and helped to design the polyethylene Skyhook series of high-altitude balloons with which the U.S. Air Force sent manned flights to more than 100,000 feet (30,000 m) to collect data on the upper atmosphere. Sport ballooning has gained in popularity over the years.

balloon fly, also called SMALL-HEADED FLY, any insect of the family Acroceridae (order Diptera), so named because of its swollen abdomen. It is also characterized by an extremely small head and a humped back. Those adults that have a slender proboscis (feeding organ) feed from flowers; those lacking a proboscis

probably do not feed in their adult stage. Their larvae are internal parasites of spiders.

balloon framing, framework of a wooden building in which the elements consist of small members nailed together. In balloon framing, the studs (vertical members) extend the full height of the building (usually two stories) from foundation plate to rafter plate, as contrasted with platform framing, in which each floor is framed separately.

Balloon framing is used primarily in Scandinavia and in the United States. Queen Anne and Shingle-style buildings are typical examples of balloon framing.

balloon vine, also called HEART-PEA, or HEART-SEED (species *Cardiospermum halicacabum*), woody perennial vine in the soapberry family (Sapindaceae) that is native to subtropical and tropical America. It is naturalized and cultivated widely as an ornamental for its white flowers and its nearly globular inflated fruits, which are about 2.5 cm (1 inch) across. The seeds are black with a heart-shaped white spot. The vine can reach an extension of 3 m (10 feet) as a perennial but is usually grown from seed as an annual.

balloonflower, also called CHINESE BELLFLOWER (species *Platycodon grandiflorum*), plant that is the only species of its genus, an East Asian perennial of the bellflower family (Campanulaceae). The balloonflower has balloonlike buds that become flaring, five-lobed, bell-shaped flowers with a thick, rubbery texture.

At maturity the fruit is a five-valved seedpod that opens at the top. The leaves are unstalked, pointed, and oval and become narrow higher on the stems, which are 30 to 70 cm (1 to 2.5 feet) long. The lavender-blue to white flowers have sharp-pointed lobes and are 5 to 7 cm (2

Balloonflower (*Platycodon grandiflorum*)

Joan E. Rahn

to 3 inches) across. Many varieties of balloonflower are cultivated as garden ornamentals and border plants.

ballooning, unpowered balloon flight in competition or for recreation, a sport that became popular in the 1960s. The balloons used are of plastic, nylon, or polyethylene, filled with hydrogen, helium, methane, or hot air.

Although ballooning began in 1783 with the flight of the Montgolfier brothers' balloons in France, the earliest uses were scientific and military. Sport ballooning began in earnest in 1906, when the American publisher James Gordon Bennett offered an international trophy for annual long-distance flights, won permanently by Belgians with victories in 1922–24. Belgium then offered the trophy until it was discontinued in 1939. This sport, like international yachting, was a rich man's sport.

Hot-air balloons in the 1965 U.S. National Championship balloon races at Reno, Nev.

Jim Larsen

The sport was revived after World War II following the introduction of new materials and the propane burner to provide hot air. Events include those for duration of flight, altitude, and distance. Hare-and-hound races entail a lead "hare" balloon that takes off and flies a certain distance, pursued by the "hound" balloons. The winner is the balloon landing closest to the "hare." The Fédération Aéronautique Internationale (FAI; International Aeronautical Federation) maintains international records for 10 classes of balloons, both gas and hot-air, ranging in volume from 250 to 16,000 cubic m (8,829 to 565,035 cubic feet).

Ballooning clubs are mainly local, and world championships have not been highly successful, but out of the sport came the record transatlantic (1978), transcontinental (1980), and transpacific (1981) flights of Maxie Anderson, Ben Abruzzo, and Larry Newman; of Anderson and his son Kristian; and of Abruzzo, Newman, Rocky Aoki, and Ron Clark, respectively.

Ballou, Hosea (b. April 30, 1771, Richmond, N.H. [now U.S.]—d. June 7, 1852, Boston, Mass.), American theologian who for more than 50 years was an influential leader in the Universalist church.

Converted in 1789 to a belief in universal salvation, he began preaching that doctrine on a Calvinist basis, substituting for John Calvin's concept of salvation of the "elect" a concept of salvation that included all of humanity. Ballou reexamined Calvinist tenets further, however, under the influence of Ethan Allen's deistic *Reason the Only Oracle of Man* (1784), and in *A Treatise on Atonement* (1805) Ballou presented his own version of Universalist theology. In 1809 he became a pastor in Portsmouth, N.H.; in 1815 he moved to Salem, Mass.; and from December 1817 until his death he was pastor of the Second Universalist Church in Boston.

Stressing the use of reason in religious thinking, Ballou shifted Universalism from its belief in a three-person Godhead to a unitarian basis that did not see God as having separately personified attributes or functions. He also discarded the doctrines of original sin and vicarious atonement, believing that Christ died not to reconcile man to God but to demonstrate God's unchanging love for man. From 1817 Ballou held that punishment for sin is limited to earthly life and that at death the soul is purified by divine love and enters immortality. The ensuing controversy resulted in the secession of the Restorationists, who believed in a limited period of punishment in the afterlife; Ballou gave his views in this dispute in *An Examination of the Doctrine of Future Retribution* (1834).

Among his many other writings are some 10,000 sermons and numerous hymns and essays. He founded and edited *The Universalist Magazine* (1819) and *The Universalist Expositor* (1830). On the *Expositor* (later *The Universalist Quarterly and General Review*) he

was assisted by his nephew, also named Hosea Ballou (1796–1861), who continued the work of the Universalist church and was the first president of Tufts College, later Tufts University.

BIBLIOGRAPHY. Ernest Cassara, *Hosea Ballou: The Challenge to Orthodoxy* (1961, reprinted 1982).

ballroom dance, European and American social dancing performed by couples. It includes the standard repertory of dances such as the fox-trot, waltz, polka, and tango as well as various fad dances from the Charleston through the jitterbug, hustle, frug, and disco dancing. In Europe, in particular, ballroom dance contests, both amateur and professional, are organized on a national and international scale.

Bally, also spelled BALI, or BALY, city, southeastern West Bengal state, northeastern India. Bally lies just west of the Hooghly River. A part of the Howrah urban agglomeration, it is connected by road and rail with Howrah, Kharagpur, and Burdwan and is a steamer station for traffic along the Hooghly. Major industries in the city include jute, paper, and bone milling, iron- and steel-rolling works, and the manufacture of chemical fertilizer, cotton cloth, bricks, and glass. The Bally Bridge across the Hooghly to Baranagar was opened in 1931. Constituted a municipality in 1883, Bally has a college that is affiliated with Rabindra Bharati University in Calcutta. Pop. (1991) 184,474.

Ballycastle, Irish BAILE AN CHAISTIL, town, Moyle district (established 1973), formerly in County Antrim, Northern Ireland. It is situated along Ballycastle Bay, opposite Rathlin Island, where Robert Bruce, king of Scotland, is said to have hidden in a cave. Ballycastle is at the mouth of Glenshesk and close to Knocklyd (1,695 feet [517 m]). The town is a market centre, fishing harbour, and resort. Nearby are the ruins of Bunamargy Franciscan Friary and Dunaneane Castle. In 1898 Guglielmo Marconi's first wireless system between a lighthouse and the mainland was installed at Rathlin and Ballycastle. Pop. (1991) 4,005.

Ballymena, district, Northern Ireland. It was established in 1973 and was formerly in County Antrim. Ballymena borders the districts of Magherafelt to the west, Ballymoney and Moyle to the north, Larne to the east, and Antrim to the south. The desolate Antrim Mountains, which reach an elevation of more than 1,430 feet (435 m) above sea level, traverse the eastern part of the district north to south, sloping westward to the River Main valley in central Ballymena. Cattle, pigs, and poultry are raised in the valley, together with barley. Diatomite is extracted from the shores of Lough (lake) Beg in southwestern Ballymena district. The Antrim Mountains are popular with grouse hunters, and anglers enjoy the rivers and streams of the Main valley. A national highway extension from Belfast facilitates travel through the valley. Ballymena town is the district seat. Area 246 square miles (638 square km). Pop. (1996 est.) 58,100.

Ballymena, Irish AN BAILE MEÁNACH, town and seat of Ballymena district, Northern Ireland. It lies in the River Main valley 24 miles (40 km) northwest of the city of Belfast. The town is the market centre for the surrounding countryside and has been long known for its production of linens and woolens; more recently, synthetic fibres have also been manufactured there. Pop. (1991) 28,112.

Ballymoney, Irish BAILE MONAIDH, town, seat, and district (established 1973), formerly within County Antrim, Northern Ireland. The town of Ballymoney, located on the eastern

side of the valley on a tributary of the River Bann, was the birthplace of James McKinley, grandfather of the U.S. president William McKinley. The town preserves a marketplace of 1775 and an old parish church (1637). Ballymoney town is now a thriving agricultural centre with textile and engineering industries as well as several bacon- and ham-processing plants.

Ballymoney district covers an area of 162 square miles (419 square km) and is bordered by the districts of Coleraine to the west, Moyle to the north and east, and Ballymena and Magherafelt to the south. From the eastern border of the district, the Antrim Mountains gradually descend to the Bann valley in the west. Significant quantities of potatoes, barley, and livestock (mostly pigs) are produced in the district. Primary roads connect Ballymoney town with the towns of Coleraine to the northwest and Ballymena to the southeast. Pop. (1981) town, 5,679; (1987 est.) district, 23,800.

balm, any of several fragrant herbs of the mint family, particularly *Melissa officinalis*, also called balm gentle, or lemon balm, and cultivated in temperate climates for its fragrant leaves, which are used as a scent in perfumery, as a flavouring in such foods as salads, soups, sauces, and stuffings, and as a flavouring in liqueurs, wine, and fruit drinks. Balm was used in medicinal teas, as a diaphoretic, and in wine drinks by the Greeks and Orientals in ancient times.

The name is also applied to *Melittis melisophyllum*, bastard balm; *Monarda didyma*, bee balm, or Oswego tea; *Collinsonia canadensis*, horse balm; *Glecoma hederacea* and *Satureja (Calamintha) nepeta*, field balm; and *Moluccella laevis*, Molucca balm, or bells of Ireland. Aromatic exudations from species of *Commiphora* (trees and shrubs of the incense-tree family) may also be referred to as balm. Balm of Gilead, or balm of Mecca, is the myrrhlike resin from *Commiphora opobalsamum* of Arabia. The balsam fir (*Abies balsamea*) is sometimes called balm fir, or balm of Gilead fir. The balm of Gilead poplar is related to the balsam poplar. Balm of heaven is the California laurel (*Umbellularia californica*).

Balmaceda, José Manuel (b. July 19, 1840, Santiago, Chile—d. Sept. 19, 1891, Santiago), liberal reformer and president of Chile (1886–91) whose conflict with his legislature precipitated a civil war.

Balmaceda was elected to the Chilean congress in 1870. While serving in the cabinet of President Domingo Santa María (1881–86), he pushed anticlerical measures and promoted public works. As president he advanced public education and railroad construction but inherited the legislative revolt against the executive begun in the 1860s. His attempts to prevent congressional limitation of the presidential powers led to civil war in 1891. Congress, with navy support, defeated Bal-

Balmaceda

By courtesy of the Organization of American States

maceda's forces within eight months. His defeat and subsequent suicide left parliamentary government entrenched until the mid-1920s.

Balmain, Pierre (-Alexandre-Claudius) (b. May 18, 1914, Saint-Jean-de-Maurienne, Fr.—d. June 29, 1982, Paris), French couturier who founded a fashion house that made his name a byword for elegance during the post-World War II years. His clients included the Duchess of Windsor, the Queen of Belgium, and many of the leading film stars of the 1950s. But one of the first and most important was the American expatriate writer Gertrude Stein, who encouraged him and publicized the House of Balmain when it opened in 1945.

Balmain had abandoned his architectural studies because of lack of money and in 1934 joined Edward Molyneux as a designer. In 1939 he went to Lucien Lelong, where he worked with Christian Dior, who was to become his main rival during their heyday in the postwar years. The House of Balmain was an immediate success, its clothes characterized by superb quality, particularly in evening wear, which combined femininity with an imposing elegance. He rapidly expanded, opening branches in New York City and Caracas and diversifying into perfume and accessories. He designed for films and for film stars, among them Marlene Dietrich, Katharine Hepburn, Sophia Loren, Ingrid Bergman, and Brigitte Bardot. As haute couture gave way to ready-to-wear, he opened boutiques and developed his ancillary interests in handbags, scarves, luggage, and even furniture.

He published his memoirs, *My Years and Seasons*, in 1964 and in 1978 was made an officer of the Legion of Honour.

Balmer, Johann Jakob (b. May 1, 1825, Lausanne, Switz.—d. March 12, 1898, Basel), Swiss mathematician who discovered a formula basic to the development of atomic theory and the field of atomic spectroscopy.

A secondary-school teacher in Basel from 1859 until his death, Balmer also lectured (1865–90) on geometry at the University of Basel. In 1885 he announced a simple formula representing the wavelengths of the spectral lines of hydrogen—the “Balmer series” (see spectral line series). Why the formula held true, however, was not explained until 1913, when Niels Bohr found that it fit into and supported his theory of discrete energy states within the hydrogen atom.

Balmes, Jaime Luciano (b. Aug. 28, 1810, Vich, Spain—d. July 9, 1848, Vich), ecclesiastic, political writer, and philosopher whose liberal ideas were strongly opposed by conservative Roman Catholics.

Receiving a doctorate in civil and canon law from the University of Cervera, Balmes returned to Vich and taught physics and mathematics. In Madrid he founded and edited a weekly newspaper, *El pensamiento de la nación* (“The Thought of the Nation”).

He is best known for his *El protestantismo comparado con el catolicismo en sus relaciones con la civilización europea* (1842–44; *Protestantism and Catholicism Compared in Their Effect on the Civilization of Europe*), a defense of Roman Catholicism against the accusation of being unsympathetic toward the spirit of progress. His philosophical works are *El criterio* (1845; “The Criterion”), called Balmes’ logic; *Filosofía fundamental* (1846; *Fundamental Philosophy*), and *Curso de filosofía elemental* (1847; “Course of Elementary Philosophy”). A critical edition of his complete works was published in 33 volumes at Madrid (1948–50).

Balmoral Castle, private residence of the British sovereign, on the right bank of the River Dee, Grampian region, Scotland, at 926 feet (282 m) above sea level. After its acquisition (1852) by Albert, the prince consort (husband of Queen Victoria), the small castle then

Balmoral Castle, Grampian region, Scotland, designed in Scottish baronial style, 1853–56

Aerofilms, Ltd.—Ewing Galloway

on the land was replaced in 1853–56 by the modern granite building, designed in Scottish baronial style. Queen Victoria and successive sovereigns have used the castle as a summer residence and for grouse shooting on the local moors, visiting the competitive Scottish sports assembly known as the Highland Games (held locally at Braemar), and attending the parish church of Crathie, 1.5 miles (2.5 km) to the east.

Balnaves, Henry (b. c. 1512, Kirkcaldy, Fife, Scot.—d. February 1579, Edinburgh), politician and diplomat who was one of the chief promoters of the Reformation in Scotland.

Converted to Protestantism while on the European continent, Balnaves favoured an Anglo-Scottish alliance, ecclesiastical reform, and a vernacular Bible. After returning to Scotland, he held various offices, and in 1543, during the Protestant period of the Earl of Arran's regency, he rose to secretary of state and became one of the commissioners appointed to arrange a marriage treaty between Mary Stuart and Prince Edward (later Edward VI of England). He was instrumental in persuading Parliament to permit the reading of Scripture in the vernacular.

Imprisoned in Blackness Castle (November 1543) after Arran's reconciliation with Roman Catholicism, Balnaves was released by English forces. Thereafter he acted as a paid agent for the English in Scotland until he was taken captive when a French expedition captured St. Andrews Castle (July 1547). While imprisoned by the French at Rouen, he wrote *The Confession of Faith*, reflecting Lutheran influence and published posthumously in 1584 with a preface by John Knox. Returning to Scotland in 1557, Balnaves was restored to his lands, took an active part in the religious rising of 1559, and was appointed an ordinary lord of session in 1564. On the fall of Mary Stuart he sided with the Protestant lords and by 1568 was a privy councillor.

Balochi, also spelled BALUCHI, or BELUCHI, group of tribes speaking the Balochi language and estimated at about 4,800,000 inhabitants in the province of Balochistan in Pakistan and also neighbouring areas of Iran, Afghanistan, Bahrain, and Punjab (India). In Pakistan the

Balochi people are divided into two groups, the Sulaimani and the Makrani, separated from each other by a compact block of Brahui tribes.

The original Balochi homeland probably lay on the Iranian plateau. The Balochi were mentioned in Arabic chronicles of the 10th century AD. The old tribal organization is best preserved among those inhabiting the Sulaimān Mountains. Each tribe (*tuman*) consists of several clans and acknowledges one chief, even though in some *tuman* there are clans in habitual opposition to the chief.

The Balochi are traditionally nomads, but settled agricultural existence is becoming more common; every chief has a fixed residence. The villages are collections of mud or stone huts; on the hills, enclosures of rough stone walls are covered with matting to serve as temporary habitations. The Balochi raise camels, cattle, sheep, and goats and engage in carpet making and embroidery. Their agricultural methods are primitive. They profess Islām.

Some 70 percent of the total Balochi population live in Pakistan. About 20 percent inhabit the coterminous region of southeastern Iran. This geographic region is the least-developed in Iran, partially owing to its harsh physical conditions. Precipitation, which is scarce and falls mostly in violent rainstorms, causes floods and heavy erosion, while heat is oppressive for eight months of the year. The mountain chains of Iranian Balochistān, including the Bāga-e Band and Bāmpusht Mountains, run east-west, parallel to the Gulf of Oman, making ingress and egress difficult. In the centre of the region there are abundant groundwater and streams, such as the Māshkid and the Kunāri, that sometimes open out into valleys.

In ancient times, Iranian Balochistān provided a land route to the Indus River valley and the Babylonian civilizations. The armies of Alexander the Great marched through Balochistān in 326 BC on their way to the Hindu Kush and, on their return march in 325, experienced great hardships in the region's barren wastes.

The Seljuq invasion of Kermān in the 11th century AD stimulated the eastward migration of the Balochi. The Seljuq ruler Qāwurd (Kavurt) sent an expedition against the Kufichis (Qufs), Balochi mountaineers whose banditry had long threatened the region's southern and eastern parts. After suppressing the Balochi, the Seljuqs put watchtowers, cisterns, and caravansaries along the desert route to encourage trade with India. The Balochi remained rebellious under Safavid rule (1501–1736). Western Balochistān was conquered by Iran in the 19th century, and its boundary was fixed in 1872. The Iranian government began to assist settlement and economic development in the 1970s by building dams and thermoelectric-power plants, though these efforts slackened after the Iranian Islāmic Revolution.

Palm-tree oases in central Iranian Balochistān contain orchards of oranges, pomegranates, mulberries, and bananas. Grain, tobacco, rice, cotton, sugarcane, and indigo plants are the principal crops. A road was opened from Zāhedān to the port of Chāh Bahār. Zāhedān also is connected by rail with Pakistan, Zābol, and Tehrān; and it is a junction for roads east-west.

Balochi language, also spelled BALUCHI, or BELUCHI, modern Iranian language of the Indo-Iranian group of the Indo-European language family. Balochi speakers live mainly in an area now composed of parts of southeastern Iran and southwestern Pakistan that was once the historic region of Balochistān. They also live in Central Asia (near Merv, Turkmenistan) and southwestern Afghanistan, and there are colonies in Oman, southern Arabia, and along the east coast of Africa as far south as Kenya.

Balochi is a Western Iranian language that is closely related to Kurdish. Despite the vast area over which it is spoken, its six dialects (Rākhshānī, Sarawānī, Kechī, Lotunī, the Eastern Hill dialects, and the coastal dialects) are all believed to be mutually intelligible. There are an estimated 4,800,000 speakers of Balochi.

Balochi rug, also spelled BALUCHI, or BELUCHI, floor covering woven by the Balochi people living in Afghanistan and eastern Iran. The patterns in these rugs are highly varied, many consisting of repeated motifs, such as the diagonal, evidently copied from other tex-

Balochi rug from Iran, 20th century; in a New York state private collection

In a New York state private collection, photograph, Otto E. Nelson

tile types. Some present a maze of intricately latch-hooked forms. Prayer rugs, with a simple rectangular arch-head design at one end (to indicate the direction of Mecca, the holy city), are common. Normally, the field of these prayer rugs is filled with the leaves and stems of a highly stylized tree, and geometric small plants appear in the spandrels.

Frequently, the Balochi rugs have long aprons at both ends, decorated with stripes and bands of brocading. The colour scheme of older rugs is a dark combination of reds and blues with touches of white. Many pieces, including those more poorly made, also make use of varying brown and tan shades, either of camel hair or material dyed to resemble it. Balochi rugs are usually all wool, but their material may also include goat and camel hair, cotton for whites, and in some cases a few knots of silk. The knotting is customarily Senna (Senna). The rugs vary greatly in quality, the better ones usually being ascribed to the Khorāsān province of Iran. Balochi rugs are frequently classed with the products of the Turkmens but show little relationship to them.

Balochistān, also spelled BALŪCHISTĀN, westernmost province of Pakistan. It is bordered by Iran (west), by Afghanistan (northwest), by North-West Frontier and Punjab provinces (northeast and east), by Sindh province (southeast), and by the Arabian Sea (south).

Although an indigenous population of the region passed through the Stone and Bronze ages and was part of Alexander the Great's

empire, the Balochi people themselves did not enter the region until the 14th century AD. The Balochi and Pashtun (Pathan) people constitute the two major and more distinct ethnic groups; a mixed ethnic stock, mainly of Sindhi origin, forms the third major group. Balochi, Brahui, Pashto, and Sindhi are the main languages. Balochistān was established as a separate province in its present form in 1970. It is the largest and most sparsely populated province in Pakistan. Its capital is Quetta.

There are four major physical regions in Balochistān. The upper highlands of the central and northeastern areas are bounded by the Sulaimān Range to the east and the Toba Kākar Range to the northwest. The lower highlands include the eastern slopes of the Sulaimān Range; the lower ranges of the Makrān, Khārān, and Chāgai on the west; and the Pab and Kirthar ranges on the southeast. These highland regions are primarily inhabited by nomadic herdsmen. Flat plains extend northward along the coast into the mountains; in the northwest an arid desert region consists of the Chāgai, Khārān, and Makran deserts and the swamps of Lora and Māshkel. The upper highlands drain into the Indus River, while the lower highlands drain northward into the swamps or southward into the Arabian Sea. Outside the influence of the Asian monsoon, most of the province is dry with continental extremes of heat and cold.

Agriculture is limited by the scarcity of water, power, and adequate transportation facilities. Wheat, jowar (sorghum), and rice are the major food crops, and fruits are the principal cash crops. Sheep raising employs the great majority of the population and occupies most of the land. The sheep provide a high-quality wool, part of which is exported. Almost all industry is small-scale and includes cotton and woolen manufacturing, food processing, carpet making, textile and leather embroidery, small machinery and appliance manufacturing, and handicrafts. The transportation network is poorly developed, but roads connect the major towns, and Quetta is connected by road to the ocean port of Karāchi in Sindh province. Quetta is a centre of the railway network, and its airport offers domestic service.

The University of Balochistān was established in Quetta in 1970. The Balochi Academy and the Pashto Academy, also in Quetta, promote the preservation of traditional cultures. Area 134,050 square miles (347,188 square km). Pop. (1983 est.) resident pop., 4,611,000.

Balodis, Jānis (b. Feb. 20, 1881, Trikata, Latvia, Russian Empire [now in Latvia]—d. Aug. 8, 1965, Saulkrasti, Latvia, U.S.S.R.), army officer and politician who was a principal figure in the foundation and government of independent Latvia. He was commander in chief of the army and navy in Latvia's war of independence and later was a cabinet member and vice president.

Graduated from the military academy at Vilnius in 1902 and commissioned an officer in the Russian army, Balodis was decorated for his service in the Russo-Japanese War (1904–05). He was wounded in action in East Prussia at the beginning of World War I and imprisoned by the Germans but eventually escaped and returned in November 1918 to Latvia. There the movement for national independence was asserting itself against both the Germans, to whom Bolshevik Russia had ceded the country in March 1918, and the Bolsheviks, who were now trying to reconquer it. Balodis took command of the Latvian national army on the death of Colonel Oskars Kalpaks in March 1919 and was officially appointed commander in chief in October. He defended the newly founded national state

against Bolshevik, German-Balt, German, and White Russian attacks.

In 1925 Balodis was elected to the Latvian Saeima (parliament), and in December 1931 he became the minister of war. Appointed deputy prime minister in the cabinet of Kārlis Ulmanis on May 15, 1934, he became vice president when Ulmanis assumed the presidency on April 11, 1936. Shortly after the Soviet army occupied Latvia in June 1940, Ulmanis' government was deposed, and in July 1940 Ulmanis and Balodis were arrested and deported to the Soviet Union. After several years Balodis was permitted to return to Latvia and was allotted a small pension.

Balovedu (people): *see* Lovedu.

Balqash, Russian БАЛҚАШ, or БАЛЧАШ, city, east-central, Kazakhstan. The city is a landing on the northern shore of Lake Balkhash. A major centre of nonferrous (copper, predominantly, and molybdenum) metallurgy, it came into being in 1937 in connection with the construction of large copper-smelting works for the Kounrad mines to the north. Fish canning is the second industry. There is a botanical garden of the Kazakh Academy of Sciences. Pop. (1999 est.) 65,400.

Balquhiddier, village, Stirling council area, Scotland. It lies near the east end of Loch Voil. Balquhiddier is famous as the burial place of the outlaw Rob Roy (Robert MacGregor), who died in 1734. His grave and those of some of his family are marked by three ancient carved stones. The ruined 17th-century church stands in front of a new church built in the 19th century.

balsa (*Ochroma pyramidale*, or *lagopus*), tree of the bombax family (Bombacaceae) that is native to tropical South America and is noted for its exceedingly light wood (Spanish *balsa*, "raft," or "float"). The wood resembles clear white pine or basswood. Well-seasoned balsa weighs only 2.7 to 3.6 kg (6 to 8 pounds) per cubic foot, although wood from very slow-growing trees may weigh more. Because of its buoyancy, which is about twice that of cork, balsa is admirably adapted for making floats for lifelines and life preservers. Its resiliency makes it an excellent shock-absorbing material for packing furniture and similar articles and also for foundation pads for machinery. Because of its insulating properties, it is used as a lining material for incubators, refrigerators, cold-storage rooms, and the like. Its lightness combined with high insulating power makes it a valuable construction material for transportation containers for solidified carbon dioxide. It is also used in the construction of passenger compartments for airplanes and in making model airplanes and boats.

Balsa seed fibre, which is known commercially as *édredon végétal* ("plant eiderdown"), or *pattes-de-lièvre* ("rabbit's paws"), is used as stuffing for mattresses and cushions. A floss mixture, composed of balsa fibre and several other seed fibres, is sold as *ouate végétale* ("plant fibres").

balsam, aromatic resinous substance that flows from a plant, either spontaneously or from an incision; it consists of a resin dispersed in benzoic or cinnamic acid esters and is used chiefly in medicinal preparations. Certain of the more aromatic varieties of balsam have been incorporated into incense. Balsams are sometimes difficult to distinguish from oleoresins, which are resins dissolved in essential oils, but usually the oleoresins are slightly more fluid.

Balsam of Peru, a fragrant, thick, deep brown or black fluid used in perfumery, is a true balsam, the product of a lofty leguminous tree, *Myroxylon pereirae*, growing in a limited area

in El Salvador and introduced into Sri Lanka. It is mentioned in pharmacopoeias but has no medicinal value. Balsam of Tolu (Colombia), a brown balsam thicker than balsam of Peru, is used in perfumery and as a constituent in cough syrups and lozenges. It becomes solid on keeping. It also is a product of equatorial America.

Canada balsam and Mecca balsam, or balm of Gilead, are not true balsams.

balsam of fir: *see* Canada balsam.

Balsamo, Giuseppe: *see* Cagliostro, Alessandro, Count di.

Balsamon, Theodore (b. c. 1105, Constantinople, Byzantine Empire [now Istanbul, Turkey]—d. c. 1195, Constantinople), the principal Byzantine legal scholar of the medieval period and patriarch of Antioch (c. 1185–95).

After a long tenure as law chancellor to the patriarch of Constantinople, Balsamon preserved the world's knowledge of many source documents from early Byzantine political and theological history through his commentary (c. 1170) on the *nomocanon*, the standard annotated collection (since the 7th century) of Eastern Orthodox ecclesiastical and imperial laws and decrees.

Balsas River, Spanish RÍO BALSAS, river in south-central Mexico, one of that country's largest rivers. It rises as the Atoyac River at the confluence of the San Martín and Zahuapan rivers in Puebla state and flows southwestward and then westward through Guerrero state, in which it is the principal river and is locally known as the Mezcala. It forms the border between Guerrero and Michoacán states and empties into the Pacific Ocean at Mongrove Point. Although its 479-mile (771-kilometre) course is unnavigable because it is frequently interrupted by rapids, the river is utilized extensively for generating hydroelectric power and for irrigation. Corn (maize), coffee, cotton, sugarcane, tropical fruits, and vegetables are the principal crops cultivated in its basin.

balshem (Judaism): *see* ba'al shem.

Balt, member of a people of the Indo-European linguistic family living on the southeastern shores of the Baltic Sea. (The name Balt, coined in the 19th century, is derived from the sea; Aestii was the name given these peoples by the Roman historian Tacitus.) In addition to the Lithuanians and the Latvians (Letts), several groups now extinct were included: the Yotvingians (Jatvians, or Jatvingians; assimilated among the Lithuanians and Slavs in the 16th–17th century); the Prussians (Germanized in the 18th century); the Curonians (Cours, or Kurs; Latvianized in the 16th century); and the Semigallians (Zemgalians) and the Selonians (Selians, extinct in the 14th century). Estonians, inhabiting the region north of Latvia, are not Balts; they are members of the Finnic peoples.

The prehistoric origin of the Balts, as of other Indo-Europeans, is obscure, but they arrived in the vast area of the eastern Baltic and west-central Russia in the 3rd millennium BC, bringing with them knowledge of agriculture and cattle raising. Because of the inaccessibility of the western part of the area, which was bound in by sea, forest, and swamps, the Balts there—ancestors of Latvians and Lithuanians—maintained their individuality and paganism until the Middle Ages. Other Balts, however, were absorbed or displaced over the centuries; the eastern Baltic tribes, in particular, spread throughout Belarus and western Russia and were Slavized after the northward expansion of the Slavs from the 7th to the 13th century AD.

In the 13th century the historical record of the Balts really begins, for it was then that the Teutonic Order and the Order of the Brothers

of the Sword conquered the Balts inhabiting the areas of Estonia and Latvia and converted them forcibly to Christianity. In reaction to the Teutonic pressures, the Lithuanians consolidated themselves into a powerful state and, allied with the Poles, checked the German expansion; by 1386, when Lithuania officially adopted Christianity, it had become a great empire. After the union between Lithuania and Poland in 1569, however, the Lithuanian aristocracy became decidedly Polish in language and politics; cultural decline and territorial shrinkage began, and by 1795 all Baltic lands were under Russian rule, which persisted, except for a period of independence from 1918 to 1940, until 1991.

Since Christianization, the Lithuanians traditionally have been for the most part Roman Catholics, and the Latvians, since the Reformation, have been Lutherans. There are also small minorities of Greek Orthodox and other Protestants.

In the past, all Baltic peoples were mainly agriculturists and, especially among Latvians, stock farmers. Originally land was held by individual peasants, but, during the era of Soviet domination (1940–91), it was taken over by large state farms and collectives. At the same time, the proportion of the population working in agriculture and the position of agriculture in the economy steadily declined. There has been considerable industrial growth; engineering products, together with textiles, are of primary importance.

Both the Lithuanians and the Latvians, despite heavy Germanic and Slavic influences, have retained a rich tradition of folktales, songs, and poetry.

Balthus, pseudonym of BALTHAZAR KLOS-SOWSKI, also spelled BALTHASAR KLOS-SOWSKY (b. Feb. 29, 1908, Paris, France—d. Feb. 18, 2001, La Rossinière, Switz.), reclusive French painter who, in the 20th century, reanimated the traditional categories of European painting—the landscape, the still life, the subject painting, and the portrait. His work belongs to no particular school or group.

Balthus was born of artistic Polish parents whose early married years were spent in Paris in an intellectual milieu that included Pierre Bonnard, André Gide, and André Derain. The family of his father—a painter, art historian, and stage designer—had left Warsaw in 1830 and settled in East Prussia, and that of his Jewish mother—also a painter—had moved from Minsk to Breslau, East Prussia, in 1873. Balthus was taken to Berlin by his parents in 1914 at the beginning of World War I, but after his parents separated in 1917 his time was divided for years between war-torn Germany and Switzerland. Rainer Maria Rilke, a friend of Balthus' mother, encouraged the precocious youth to publish an early book of drawings about Mitsou, a lost cat, for which Rilke also contributed a preface.

With the help of Gide, Balthus returned to Paris in 1924 and began studying and painting with financial aid raised on his behalf in part by Rilke. Balthus soon began to support himself by accepting commissions for stage sets and portraits, but, after his first one-man show in Paris in 1934, he devoted most of his time to increasingly large and mysterious poetic interiors and austere, muted landscapes that were peopled with isolated, pensive adolescent girls. Portraits from this period have an erotic, disturbing atmosphere.

Balthus was given a successful show at the Museum of Modern Art in New York City in 1956, served as director of the French Academy in Rome from 1961 to 1977 (earning André Malraux's praise as France's "second ambassador to Italy"), and was honoured with huge retrospectives at the Georges Pompidou Centre in Paris in 1983 and the Metropolitan Museum in New York City in 1984. His best-

"The Street," oil on canvas by Balthus, 1933 (1.95 × 2.40 m); in the Museum of Modern Art, New York City

The Museum of Modern Art, New York City, James Thrall Soby Bequest, photograph © 1994 The Museum of Modern Art, New York City

known works include "The Street" (1933), "Guitar Lesson" (1934), "The Mountain" (1937), "Therese" (1938), "Patience" (1943), "The Méditerranée's Cat" (1949), "Le Passage du Commerce Saint-André" (1954), "Nude in Front of a Mantel" (1955), "Golden Afternoon" (1957), and "Card Players" (1973).

Bălți, formerly BELTS, also spelled BELTSY, or BELCY, city, northern Moldova, on the Răut (Reut) River. Bălți, dating from the 15th century, is a major railway junction and the centre of the rich agricultural Bălți Steppe. Most industries are concerned with processing farm produce, notably flour milling, sugar refining, and wine making, but furniture, agricultural machinery, and fur clothing also are made. Bălți has a teacher-training institute and a medical school. Pop. (1991 est.) 164,900.

Baltic Entente, mutual-defense pact signed by Lithuania, Latvia, and Estonia on Sept. 12, 1934, that laid the basis for close cooperation among those states, particularly in foreign affairs. Shortly after World War I, efforts were made to conclude a Baltic defense alliance among Finland, Estonia, Latvia, Lithuania, and Poland, all of which had recently broken away from the Russian Empire to form independent states and feared the aggressive policies of Soviet Russia. But by the mid-1920s, when negotiations had failed to produce an agreement, the idea of a broad Baltic league was dropped in favour of a pact among Estonia, Latvia, and Lithuania. Latvia and Estonia had formalized a bilateral-defense agreement in November 1923, and, after they renewed it in February 1934, they invited Lithuania to join their alliance. On Sept. 12, 1934, the three nations signed the Treaty of Understanding and Cooperation at Geneva.

Aimed mainly against Nazi Germany, which had replaced the Soviet Union as the most likely aggressor, the treaty, which was to last for 10 years, provided for mutual-defense assistance in case of attack and for semiannual foreign ministers' meetings to coordinate the signatories' foreign policies and diplomatic activities. It also pledged the three countries not only to confer with each other on all foreign-policy matters of mutual concern (excluding Lithuania's outstanding territorial disputes with Germany over Klaipėda [German: Memel] and with Poland over Vilnius) but also to give each other diplomatic and political aid. As a result, the three Baltic nations sent only a single representative to all international conferences, including the meetings of the League of Nations; in 1936 Latvia, as a representative of all three states, was elected a non-permanent member of the League's council. The pact, which was successful in stimulating close cooperation in cultural and economic as

well as foreign affairs, failed, however, as a means of defense. Notwithstanding their declaration of neutrality (1938), the Baltic-pact members were not able to defend their independent status. Under the German-Soviet Pact of August 1939, the Baltic States were recognized as belonging to the Soviet sphere of interest; they were unable to prevent being annexed in 1940 by the Soviet Union.

Baltic languages, group of Indo-European languages that includes modern Latvian and Lithuanian, spoken on the eastern shores of the Baltic Sea, and the extinct Old Prussian, Yotvingian, Curonian, Selonian, and Semigallian languages. The Baltic languages are related more closely to Slavic, Germanic, and Indo-Iranian than to other languages of the Indo-European family.

A brief treatment of the Baltic languages follows. For full treatment, see MACROPAEDIA: Languages of the World.

The domain of the Baltic languages was far greater in the past, extending eastward from the Vistula River at least as far as the upper Dnieper River basin. Of the extinct Baltic languages, there are written records only for Old Prussian. Lithuanian and Latvian (East Baltic) are more closely related to each other than either is to Old Prussian (West Baltic).

The Baltic languages have a number of isoglosses in common with Slavic and Germanic and could therefore be considered part of a northern Indo-European dialect area. They are most closely related to the Slavic branch of Indo-European. Strong evidence in support of a period of Balto-Slavic unity is found in common lexical items: more than 100 words are common in their form and meaning to Baltic and Slavic alone. Morphological, tonal, and stress correspondences also demonstrate this relationship.

Of the East Baltic languages, Lithuanian is unusually conservative in its phonology. Certain Lithuanian words, for example, can serve as protoforms for Latvian and are often nearly identical with the forms posited for Proto-Slavic. Lithuanian is thus of particular importance for comparative Indo-European linguistics. Latvian, by contrast, has undergone extensive sound change.

Baltic religion, the religious beliefs and practices of the Balts, ancient inhabitants of the Baltic region of eastern Europe.

A brief treatment of Baltic religion follows. For full treatment, see MACROPAEDIA: European Religions, Ancient.

The study of Baltic religion has developed as an offshoot of the study of Baltic languages, the oldest Indo-European language group. Just as these languages—Old Prussian, Latvian, and Lithuanian—correlate closely with the an-

cient Indian language Sanskrit, so does Baltic religion exhibit many features that conform to Vedic (ancient Indian) and Iranian ideas. Thus Baltic religious concepts help in understanding the formation and structure of the oldest phases of Indo-European religion.

Although archaeology has revealed much about burial practices and modes of worship in the Baltic area, historical documents and even linguistic source material remain problematic because of the region's long domination by the Germans. Folklore contains the greatest wealth of ancient forms and ideas, since the Germans emphasized economic exploitation over religious conversion.

Three main characteristics are discernible in Baltic religion. The first is the predominance of the sky gods—Dievs (the personified sky), Perkons (the thunderer), Saule (the sun [female]), and Mēness (the moon [male]). The second trait is the important role of destiny, luck, or fate, personified as the goddess Laima, who is regarded not as plotting the details of every life but as prescribing the limits within which each individual exercises choice and will. The third characteristic is the assignment of the realms of nature and the underworld to female divinities known as mothers. The principal among these, the Earth Mother, personifies the earth itself and oversees human welfare in general. The association of divinities with particular aspects of the natural world (e.g., Mother of the Fields, Mother of Snow) represents a later differentiation of roles.

The primary themes of Baltic mythology as it survives in folklore are the structure of the world and the enmity between Saule and Mēness. The four-line folk songs called *dainas*, which resemble Vedic verses, portray the world in dualistic terms. The sky mountain and the sun tree, or world tree, are central mythic concepts. Excavations have revealed temples made of wood, and another important ritual site was the bathhouse, in which birth ceremonies and funerals were performed. Various places in the home were considered to be abodes of spirits, and each work site had its guardian spirit, to whom sacrifices were offered. Little is known about the performers of these and other rites.

Important festivals marked the summer solstice and the harvest, and marriage and funeral ceremonies, which corresponded closely to their Old Indian counterparts, lasted for several days. The funeral rite, in fact, drew much upon the wedding, thus illustrating the Baltic concept that the boundary between the worlds of the living and the dead is illusory. The Baltic religion did not recognize contemplation or mysticism but rather prescribed the ritual observance of the cosmic order as the means of experiencing the divine.

Baltic Sea, German OSTSEE, Swedish ÖSTERSJÖN, Russian BALTIYSKOYE MORE, Finnish ITÄMERI, Polish MORZE BALTYSKIE, arm of the North Atlantic Ocean extending northward from the latitude of southern Denmark almost to the Arctic Circle, separating the Scandinavian peninsula from the rest of continental Europe.

A brief treatment of the Baltic Sea follows. For full treatment, see MACROPAEDIA: Atlantic Ocean.

The Baltic Sea is encircled by Norway, Sweden, Finland, Estonia, Latvia, Lithuania, Russia, Poland, Germany, and Denmark. Covering an area of some 160,000 square miles (420,000 square km), it is the largest expanse of brackish water in the world. Among its major affluents are the Vistula and the Oder rivers. The catchment area drained by the rivers bringing fresh water into the Baltic Sea is about four times as large as the sea itself. The Baltic Sea's major axis, from eastern

Denmark to southern Finland, is about 1,000 miles (1,600 km) long, and its average width is some 120 miles (190 km). The western Baltic is connected to the North Sea by a strait called the Skagerrak, a deep inlet that separates southern Norway from the tip of the Jutland peninsula; immediately east of the Skagerrak, but at a right angle to it, the shallower strait known as the Kattegat separates northeastern Denmark from Sweden. The large islands of Bornholm (Denmark) and Öland and Gotland (Sweden) lie in the western Baltic, while the Åland Islands, farther north, rise from a narrows between Sweden and Finland and mark the entrance to the arm of the Baltic known as the Gulf of Bothnia. Just south of the Åland Islands, the narrow Gulf of Finland stretches eastward between Finland on the north and Estonia and Russia on the south, with St. Petersburg at its head.

The Baltic is a remnant of the water-covered region that emerged as the Scandinavian ice sheet retreated toward the Arctic at the close of the Ice Age. The shallowest part of the Baltic is the continental shelf, from which rise the islands of the Danish archipelago. Its greatest depths, over 1,500 feet (457 m), lie off the southeastern coast of Sweden between the town of Nyköping and the island of Gotland and also in the Gulf of Bothnia in the Åland Sea between Sweden and the Åland Islands. A deepwater channel extends along most of the Gulf of Finland.

The modifying effect of the North Atlantic Current is scarcely felt in the Baltic. Furthermore, the Baltic's waters contain only about a quarter as much salt as the oceans and thus freeze more readily. A fifth of the surface of Europe drains into the Baltic through more than 250 rivers, including the mighty Oder, Vistula, Neva, and Neman. This huge flow of river water, with the limited egress of Baltic waters through the narrow passages to the North Sea, explains why Baltic waters are almost fresh. Even when the Baltic is open to navigation it is dangerous to ships because of frequent violent storms and sudden wind changes.

Baltic states, present-day states of Estonia, Latvia, and Lithuania, on the extreme eastern shores of the Baltic Sea. They are bounded by the sea to the west and north, by Russia to the east, by Belarus to the southeast, and by Belarus, Poland, and an exclave of Russia to the south. Ruled for centuries by their more powerful neighbours, the three Baltic states were independent from 1918 until 1940, when, during World War II, they were overrun by the Soviet Union. They reclaimed their independence from the Soviet Union in 1991. Area 67,620 square miles (175,137 square km). Pop. (1999 est.) 7,585,824.

A brief treatment of the Baltic states follows. For full treatment, see MACROPAEDIA: Baltic States.

Physical and human geography. All three Baltic states occupy low-lying plains that alternate with hilly uplands deposited by Ice Age glaciers. The Neman, Western Dvina, and other rivers empty northwestward into the Baltic Sea. The region has a cool, damp climate. The Latvian and Lithuanian peoples speak languages belonging to the Baltic branch of the Indo-European linguistic family, while the Estonian (and Livonian) peoples speak languages of the Finno-Ugric family. Agriculture remains important to the economy, with cereal grains, potatoes, and fodder crops produced and dairy cattle and pigs raised. The Baltic states are fully industrialized, with machine building, metal fabricating, and the production of electronics, home appliances, transportation equipment, and textiles among the leading activities.

History. The Baltic lands were originally set-

tled by a variety of peoples, including Estonians, Livonians, Latvians, and Lithuanians. In the 13th century northern Estonia fell under Danish rule, while Livonia (corresponding to modern Latvia and southern Estonia) was conquered and converted to Christianity by the German Order of the Knights of the Sword. Unlike its neighbours, Lithuania developed into a powerful, unified state that by the mid-14th century controlled a vast territory extending from the Baltic Sea to lands beyond the Dnieper River in the east and almost to the Black Sea in the south. In 1386 its ruler Jogaila formed a personal union between the dynasties of Lithuania and Poland; but, afterward, Lithuania gradually fell under Polish domination, and in 1569 the two states entered into a formal union. With the breakdown of the Teutonic Order in the 16th century, Poland-Lithuania, Sweden, Denmark, and Russia struggled for control of Livonia; and by the end of the 18th century all the Baltic lands had come under Russian rule. After the Russian Revolution of 1917 and the conclusion of World War I, Estonia, Latvia, and Lithuania fought off both German and Soviet forces and established themselves as independent states in 1918. All three countries then adopted democratic, parliamentary constitutions and enacted broad land reforms to modernize their political structures and economies. But their governments were unstable, and authoritarian regimes gained power in Lithuania (1926), Estonia (1934), and Latvia (1934). In 1940 the Baltic states were invaded by the Soviet Union and were formally incorporated into the U.S.S.R.

The Baltic states were integrated into the Soviet Union's political-economic system, but they remained among the most prosperous areas in the Soviet Union, as well as the most Europeanized. In the late 1980s, in response to the liberalization of the Soviet regime undertaken by Mikhail Gorbachev, the Baltic states saw an upsurge in nationalist feeling and a renewed resentment of Russian domination. With the disintegration of the Soviet Union in 1991, the Baltic states attained their independence and went on to reestablish democratic, parliamentary constitutions.

Baltimore, city, north-central Maryland, U.S. It lies at the head of the Patapsco River estuary, about 15 miles (25 km) above Chesapeake Bay. Baltimore is Maryland's largest city covering a land area of 81 square miles (209 square km). Separated from Baltimore county in 1851, it is the only city in Maryland not located within a county.

Baltimore was established in 1729 and named for the Irish barony of Baltimore (seat of the Calvert family, proprietors of the colony of Maryland). It was created as a port for shipping tobacco and grain, and soon local waterways were being harnessed for flour milling.

At the outbreak of the American Revolution, it was a bustling seaport and shipbuilding centre. Baltimore clippers plied the seas, and trade extended to the Caribbean. The U.S. Navy's first ship, the *Constellation*, was launched in Baltimore in 1797, and its namesake, the last all-sail warship built (1854) for the navy, has been moored in the city's harbour since 1955; in the late 1990s the ship underwent extensive restoration. The Continental Congress met in Baltimore (December 1776–March 1777) when it was feared the British would attack Philadelphia. During the War of 1812 the British tried to capture Baltimore; U.S. forces' successful defense (Sept. 13–14, 1814) of nearby Fort McHenry (now a national monument and historic shrine) was the inspiration for Francis Scott Key's "The Star-Spangled Banner." In 1827 the nation's first railroad, the Baltimore and Ohio, started from the city's Mount Clare Station (preserved; now the site of a railroad museum). During the American Civil War, though Maryland did not secede from the Union, many of its citizens had Southern sympathies. Union troops occupied Baltimore throughout the war, and the city recovered only gradually.

A fire on Feb. 7, 1904, razed most of the business district, but recovery was rapid. At the beginning of World War I, Baltimore began to develop industrially with steelworks, oil refineries, and related war industries. A period of urban decay in the city centre after World War II was followed by a major renovation of the downtown and waterfront areas.

Baltimore is now a major seaport with ship-repair facilities and a highly diversified economy. The port opens to the sea through Chesapeake Bay and the Chesapeake and Delaware Canal. The headquarters of the federal Social Security Administration is in the city. Services, including health care, education, finance, and insurance, are important to the economy, as are the federal government and the military. Manufactures include automobiles, electronics, steel, processed foods, paper and plastic products, and aircraft parts.

In the 1920s and early '30s Baltimore acquired an intellectual aura from the work of H.L. Mencken, essayist and editor, and his circle, including journalists on the *Sun* newspaper. Educational institutions in the Baltimore area include the renowned Johns Hopkins University (1876); Coppin State College (1900), Towson University (1866), the University of Maryland, Baltimore (1807), and the University of Baltimore (1925), all part of the University of Maryland system; and Loyola College in Maryland (1852), the College of Notre Dame of Maryland (1873), Morgan State University (1867), the Maryland Institute College of Art (1826), Baltimore City Community College (1947), and the Peabody Institute Conservatory of Music (1857). The

The Washington Monument (centre), Baltimore, Md.

Paul Conklin

city's cultural facilities include the Enoch Pratt Free Library (1884), the Peale Museum (1814), the Baltimore Museum of Art (1914), the Walters Art Gallery (1934), and a symphony orchestra, civic opera, and stage theatre. The Baltimore Civil War Museum (1997) includes exhibits on the city's part in the Underground Railroad. The city's Inner Harbor area was revitalized in the 1980s and includes the National Aquarium in Baltimore.

In 1789 Baltimore was named the first Roman Catholic diocese in the United States, and the Basilica of the National Shrine of the Assumption of the Blessed Virgin Mary (1806–21) was the nation's first Roman Catholic cathedral; St. Mary's Seminary and University was founded in 1791. The Shot Tower (1828) is a 234-foot (71-metre) shaft that was used to manufacture round shot. The Washington Monument (1829) is a 178-foot (54-metre) Doric column. Hampton National Historic Site, Aberdeen Proving Ground, and Pimlico Race Course (home of the Preakness Stakes) are nearby, as are several state parks, including Gunpowder Falls, Hart-Miller Island, North Point, and Patapsco Valley.

The city's representatives in professional sports are the Orioles (baseball) and the Ravens (American football). The birthplace of the baseball player Babe Ruth is preserved as a shrine and museum, and the grave of author Edgar Allan Poe is in the city. The Lacrosse Museum and National Hall of Fame at Johns Hopkins University attests to the popularity of the old Native American game in Baltimore.

Baltimore/Washington International Airport also serves Washington, D.C. The Baltimore Harbor Tunnel (1957), the Fort McHenry Tunnel (1985), and Francis Scott Key Bridge (1977) cross the Patapsco River. Inc. town, 1729; city, 1796. Pop. (2004 est.) city, 636,251; Baltimore-Towson MSA 2,639,213.

Baltimore, BARONS, titled English nobility in the family Calvert, grouped below chronologically and indicated by the symbol ●.

●**Baltimore (of Baltimore), George Calvert, 1st Baron**, also called (1617–25) SIR GEORGE CALVERT (b. 1578/79, Kipling, Yorkshire, Eng.—d. April 15, 1632), English statesman, who projected the founding of the North American province of Maryland, in an effort to find a sanctuary for Roman Catholics.

Calvert was educated at Trinity College, Oxford (B.A., 1597), and became secretary to Robert Cecil, afterward earl of Salisbury. Calvert served in the House of Commons from 1609 to 1611. He was knighted in 1617, became a secretary of state in 1619, and was given a pension in 1620. Serving in the House of Commons from 1621, he had the tasks of communicating King James I's policy and of obtaining royal supplies. He was distrusted by the Parliament and was in favour of the unpopular alliance with Spain and the king's Spanish marriage. On Feb. 12, 1625, after he had declared himself a Roman Catholic, Calvert gave up his office, was created Baron Baltimore in the Irish peerage, and received a grant of large estates in Ireland.

In 1621 Baltimore had sent Captain Edward Wynne to Newfoundland to establish a settlement named Ferryland; in 1623 he procured a charter for the colony under the name Avalon. Baltimore visited Avalon briefly in 1627 and returned with most of his family the following year. In the course of this extended visit, conflict arose over his Roman Catholic practices and the presence of priests who had accompanied him. In addition, the climate proved too severe, taking its toll in death and illness among the settlers, and Lady Baltimore left for Virginia in 1628. Baltimore thereupon petitioned King Charles I for a land grant in the more temperate Chesapeake Bay area and, without waiting for a reply, sailed for Jamestown to join his wife. He was, however, forbidden to settle in Virginia because of his

religion. He returned to England to plead his case for the Maryland charter but died before a new cession could be secured. (The cession was secured by his son.)

●**Baltimore (of Baltimore), Cecilius Calvert, 2nd Baron** (b. 1605—d. Nov. 30, 1675), founder of the colony of Maryland. He was the eldest son of the 1st Baron Baltimore, who had initiated the idea of a sanctuary for Roman Catholics in the Americas.

Cecilius Calvert studied at Trinity College, Oxford, and married Anne Arundell, daughter of the 2nd Baron Arundell of Wardour. The charter for Maryland was issued on June 20, 1632, two months after his father's death, and he received it as the 2nd Baron Baltimore. He never visited the New World himself but instead entrusted governorship of the colony to his younger brother, Leonard Calvert (1606–47). During this period the Calverts sought to establish freedom of conscience in the colony for both Roman Catholics and Protestants who accepted the doctrine of the Trinity.

●**Baltimore (of Baltimore), Charles Calvert, 3rd Baron** (b. Aug. 27, 1637, England—d. Feb. 21, 1715, London), English statesman, who was commissioned governor of Maryland in 1661 and succeeded as proprietor of the colony in 1675.

Charles Calvert was a Roman Catholic, and anti-Catholic feeling was strong among Maryland's Protestant majority. Matters were further aggravated by the hostility of the Susquehanna Indians, as well as by Calvert's need to defend his territorial jurisdiction against claims by William Penn to the north. Antagonism in the Maryland Assembly led Calvert to restrict the suffrage by property qualifications and to set aside acts of the legislature. Finally, after the Revolution of 1688 in England, he was deprived of the province. He returned to England and was later accused of taking part in two Roman Catholic plots but was never arrested. His son, Benedict Leonard Calvert (4th Baron Baltimore), conformed to the established Church of England in 1713 and thereupon had the colony of Maryland restored to him.

Baltimore, David (b. March 7, 1938, New York, N.Y., U.S.), American virologist, who shared the Nobel Prize for Physiology or Medicine in 1975 with Howard M. Temin and Renato Dulbecco. Baltimore and Temin independently discovered reverse transcriptase, an enzyme that synthesizes DNA from RNA. Baltimore's research led to an understanding of the interaction between viruses and the genetic material of the cell. All three men contributed to an understanding of the role of viruses in the development of cancer.

Baltimore and Temin both studied the process by which certain tumour-causing RNA viruses (those whose genetic material is composed of RNA) replicate after they infect a cell. They simultaneously demonstrated that these RNA viruses, now called retroviruses, contain the blueprint for an unusual enzyme—a polymerase called reverse transcriptase—that copies DNA from an RNA template. The newly formed viral DNA then integrates into the infected host cell, an event that can transform the infected cell into a cancer cell.

Baltimore received a degree in chemistry from Swarthmore College, Pennsylvania (B.A., 1960), he then studied animal virology at the Rockefeller Institute (now Rockefeller University) in New York City, where he obtained his doctorate in 1964, and at the Massachusetts Institute of Technology (MIT) in Boston. He worked with Dulbecco at the Salk Institute in La Jolla, Calif. (1965–68), studying the mechanism of replication of the poliovirus.

Baltimore joined the faculty of MIT in 1968 accompanied by Alice Huang, who had worked on vesicular stomatitis virus (VSV) at the Salk Institute. In Boston, Baltimore and Huang,

who had married, showed that VSV, an RNA virus, reproduced itself by means of an unusual enzyme (an RNA-dependent RNA polymerase) that copies RNA by a process not involving DNA. Baltimore then turned his attention to two RNA tumour viruses—Rauscher murine leukemia virus and Rous sarcoma virus—to discover whether a similar enzyme was at work in their replication. It was through these experiments that he discovered reverse transcriptase. This discovery proved an exception to the “central dogma” of genetic theory, which states that the information encoded in genes always flows unidirectionally from DNA to RNA and cannot be reversed. Since its discovery, reverse transcriptase has become an invaluable tool in recombinant DNA technology.

Baltimore became director of the Whitehead Institute for Biomedical Research, Cambridge, Mass., in 1983 and in 1990 left to become president of Rockefeller University. In 1989 he figured prominently in a public dispute over a 1986 paper published in the journal *Cell* that he had coauthored while still at MIT. The coauthor of the article, Thereza Imanishi-Kari, was accused of falsifying data published in the paper. Baltimore, who was not included in charges of misconduct, stood behind Imanishi-Kari, although he did retract the article. Because of his involvement in the case, however, he was asked to resign as president of Rockefeller University, and in 1994 he returned to MIT. In 1996 a U.S. government panel cleared Imanishi-Kari of the charges of scientific misconduct.

From 1997 to 2006 Baltimore was president of the California Institute of Technology. In 2005 he became a member of the Encyclopædia Britannica Editorial Board of Advisors.

Baltimore and Ohio Railroad (B&O), first steam-operated railway in the United States to be chartered as a common carrier of freight and passengers (1827). The B&O Railroad Company was established by Baltimore (Md.) merchants to compete with New York merchants and their newly opened Erie Canal for the trade to the west. A driving force in its early years was the Baltimore banker George Brown, who served as treasurer from 1827 until 1834 and had Ross Winans build the first real railroad car.

The first stone for the line was laid on July 4, 1828, by Charles Carroll, the American Revolutionary leader and last surviving signer of the Declaration of Independence. The first 13 miles (21 km) of line, from Baltimore to Ellicott's Mills, Md. (now Ellicott City), opened in 1830. Peter Cooper's steam locomotive, the *Tom Thumb*, ran over this line and demonstrated to doubters that steam traction was feasible on the steep, winding grades.

The railroad was extended to Wheeling, Va. (now in West Virginia), a distance of 379 miles (610 km), in 1852. In the 1860s and

The *Tom Thumb*, first American-built locomotive to operate in regular service

By courtesy of CSX Transportation Inc

'70s, the railroad reached Chicago, Ill., and St. Louis, Mo. In 1896 it went bankrupt. After it was reorganized in 1899, it grew further, reaching Cleveland, Ohio, and Lake Erie in 1901. In 1963 the B&O was acquired by the Chesapeake and Ohio Railway Company and in 1980 became part of the newly formed CSX Corporation.

The B&O's long-distance passenger trains were discontinued in 1971 when the National Railroad Passenger Corporation (Amtrak) took over intercity passenger service, although it continued limited commuter service at Washington, D.C., and Pittsburgh, Pa. About one-quarter of the B&O's freight revenues come from its traditional haulage of bituminous coal from mines in the Allegheny Mountains. Other important freight includes motor vehicles and parts, as well as chemicals.

Baltimore clipper, small, fast sailing ship developed by Chesapeake Bay (U.S.) builders in the 18th century. Its speed made it valuable for use as a privateer, for conveying perish-

Baltimore clipper *Ann McKim*, drawing and lithograph by E. Armitage McCan

Courtesy of Peabody Essex Museum, Salem, Mass.

ables, and in the slave trade, and its hull design gives it claim as an ancestor of the larger clipper ships of the 19th century. Most Baltimore clippers had two steeply raked masts that were rigged with various combinations of fore-and-aft and square sails.

Baltimore Incident: *see* Itata and Baltimore incidents.

Baltistān, geographic region of the Northern Areas, in the Pakistani-administered sector of the Kashmir region, in the northwestern part of the Indian subcontinent. Drained by the Indus River and tributaries such as the Shyok River, Baltistān is situated on the high Ladākh Plateau and contains the loftiest peaks of the Karakoram Range—K2 (Mount Godwin Austen; at 28,251 feet [8,611 m]) the second highest mountain in the world), Gasherbrum I (26,470 feet [8,068 m]), and Broad Peak I (26,401 feet [8,047 m]). Baltistān has a harsh climate, with an average annual precipitation of only 6 inches (150 mm). It contains several glaciers, including Siachen Glacier, the site of skirmishes between Indian and Pakistani troops. The valleys lie at elevations of 8,000 to 10,000 feet (2,500 to 3,000 m). Baltistān is chiefly inhabited by Baltis, Muslims of Tibetan origin who eke out a meagre living growing crops (mainly barley and fruits).

Baltit (Jammu and Kashmir): *see* Hunza.

Baltiysk, also spelled BALTIIISK, or BALTIJSK, formerly (until 1946) PILLAU, city and port, Kaliningrad *oblast* (province), northwestern Russia. It lies at the entrance to the tip of the narrow peninsula separating Frisches Lagoon

from the Baltic Sea. Originally the German East Prussian town of Pillau (1686–1946), Baltiysk is connected by canal to Kaliningrad and serves as its outpost. It also has good railway connections with Lithuania, Poland, and Belarus. Baltiysk has metalworking and light-engineering industries as well as ship-repairing facilities. Pop. (2000 est.) 31,200.

Balto-Slavic languages, hypothetical language group comprising the languages of the Baltic and Slavic subgroups of the Indo-European language family. Those scholars who accept the Balto-Slavic hypothesis attribute the large number of close similarities in the vocabulary, grammar, and sound systems of the Baltic and Slavic languages to development from a common ancestral language after the breakup of Proto-Indo-European. Those scholars who reject the hypothesis believe that the similarities are the result of parallel development and of mutual influence during a long period of contact.

Balra Island, also called SOUTH SEYMOUR ISLAND, one of the smaller of the Galápagos Islands, with an area of 8 square miles (21

square km). It lies in the eastern Pacific Ocean, about 600 miles (1,000 km) west of Ecuador. Before volcanic faulting occurred, the island was a part of Santa Cruz (Indefatigable) Island. During World War II, Ecuador granted the United States permission to establish an air base there (defunct since 1946). With the growth of tourism, the Ecuadoran government renovated the airfield, which is now the main point of entry for visitors to the islands.

Balue, Jean (b. c. 1421, Angles-sur-l'Anglin, Poitou, France—d. 1491, Ancona, Papal States [Italy]), French cardinal, the treacherous minister of King Louis XI.

Of humble parentage, Balue was first patronized by the bishop of Poitiers. In 1461 he became vicar-general of the bishop of Angers. His activity, cunning, and mastery of intrigue gained him the appreciation of Louis XI, who made him his almoner. In a short time Balue came to be a considerable personage. In 1465 he received the bishopric of Évreux; the king made him *le premier du grant conseil* and, in spite of Balue's dissolute life, obtained for him a cardinalate (1468). But in that year also,

Balue was compromised in the king's humiliation by Charles the Bold, duke of Burgundy, at Péronne and was excluded from the council.

Balue then intrigued with Charles against his master; their secret correspondence was intercepted, and on April 23, 1469, Balue was thrown into prison, where he remained 11 years, but not, as has been alleged, in an iron cage. In 1480, through the intervention of Pope Sixtus IV, he was set at liberty and from that time lived in high favour at the court of Rome. He received the bishopric of Albano and afterward that of Palestrina. In 1484 he was even sent to France as a legate.

Bālurghāt, city, northern West Bengal state, northeastern India, just east of the Atrai River. Situated near the Bangladeshi border, it is a regional distribution centre, trading mainly in rice, jute, sugarcane, and oilseeds. It was declared a municipality in 1951. Pop. (2001 prelim.) 135,516.

balustrade, low screen formed by railings of stone, wood, metal, glass, or other materials and designed to prevent falls from roofs, balconies, terraces, stairways, and other elevated architectural elements.

The classic Renaissance balustrade consisted of a broad, molded handrail supported by a series of miniature columns of freely adapted traditional form. On building exteriors it was made of stone; in interiors, often of wood. These supporting columns are known as balusters and may be of shaped wood or metal and either decorated or not. In modern balustrades the uprights are frequently of metal and placed far apart to support horizontal rails of wood or panels of glass or plastic.

Stairway and porch balustrades of Chiswick House, London, built by Lord Burlington, 1725

A.F. Kersting

The pulpit balustrade in Siena Cathedral, Italy, and the parapet of the Pitti Palace, Florence, constitute good examples of classic balustrades.

Baluze, Étienne (b. Nov. 24, 1630, Tulle, France—d. July 28, 1718, Paris), French scholar, notable both as a historian and as the collector and publisher of documents and manuscripts.

At the Collège St. Martial at Toulouse, he studied chiefly ecclesiastical history and canon law, becoming in 1654 secretary to the archbishop of Toulouse, who was a noted historian. After five years as secretary to the bishop of Auch, Baluze in 1667 entered the service of Jean-Baptiste Colbert, the future minister of finances to King Louis XIV, as his librarian, a post that he was to hold for more than 30 years. In 1670 he received the additional appointment of professor of canon law at the Collège Royal.

He published his *Concilia Galliae Narbonensis* in 1668, following this with other important works, including *Capitularia regum Francorum* (1677), *Miscellanea* (1678–83), *Nova collectio Conciliorum* (1683, only one volume published), and *Vitae Papporum Avenionensium* (1693). He also edited the works of many ecclesiastical writers. In 1700 he relinquished

his position as librarian, having enormously enriched Colbert's collection of books, and in 1707 was appointed director of the Collège Royal. In 1708 appeared his *Histoire généalogique de la maison d'Auvergne*, undertaken at the request of the Cardinal de Bouillon. In that work, which purported to trace the cardinal's descent from the counts of Auvergne in the 9th century, Baluze made use of documents already proved to have been forged. After Bouillon fled abroad, Baluze was deprived of all his offices and banished for some years from Paris. While in exile he completed his *Historia Tutelensis* (1717).

Baly (India): see Bally.

Balzac, Honoré de, original name HONORÉ BALSSA (b. May 20, 1799, Tours, Fr.—d. Aug. 18, 1850, Paris), French literary artist who produced a vast collection of novels and short stories called *La Comédie humaine* (*The Human Comedy*). He helped to establish the orthodox classical novel and is generally considered to be one of the greatest fiction writers of all time.

Early career. Balzac's father was a man of southern peasant stock who had worked in the civil service for 43 years under Louis XVI and Napoleon. Honoré's mother came from a family of prosperous Parisian cloth merchants. His sister Laure (later de Surville) was his only childhood friend, and she became his first biographer.

Balzac was sent to school at the Collège des Oratoriens at Vendôme from age 8 to 14. At Napoleon's downfall his family moved from Tours to Paris, where he went to school for two more years and then spent three more as a lawyer's clerk. During this time he already aimed at a literary career, but as the writer of *Cromwell* (1819) and other tragic plays he was utterly unsuccessful. He then began writing novels filled with mystic and philosophical speculations before turning to the production of potboilers—gothic, humorous, historical novels—written under composite pseudonyms. Then he tried a business career as a publisher, printer, and owner of a typefoundry, but disaster soon followed. In 1828 he was narrowly saved from bankruptcy and was left with debts of more than 60,000 francs. From then on his life was to be one of mounting debts and almost incessant toil. He returned to writing with a new mastery, and his literary apprenticeship was over.

Two works of 1829 brought Balzac to the brink of success. *Les Chouans*, the first novel he felt enough confidence about to have published under his own name, is a historical novel about the Breton peasants called Chouans who took part in a royalist insurrection against Revolutionary France in 1799. The other, *La Physiologie du mariage* (*The Physiology of Marriage*), was a humorous and satirical essay on the subject of cuckoldry, encompassing both its causes and its cure. The six stories in his *Scènes de la vie privée* (1830; "Scenes from Private Life") further increased his reputation. These long short stories are for the most part psychological studies of girls in conflict with parental authority. The minute attention he gave to describing domestic background in his works anticipates the spectacularly detailed societal observations of his later Parisian studies.

Balzac henceforth spent much of his time in Paris. He began to frequent some of the best-known Parisian salons of the day and redoubled his efforts to set himself up as a dazzling figure in society. To most people he seemed full of exuberant vitality, talkative, jovial and robustious, egoistic, credulous, and boastful. He adopted for his own use the armorial bearings of an ancient noble family with which he had no connection and assumed the honorific particle *de*. He was avid for fame, fortune, and love but was above all conscious of his own genius. He also began to have love affairs with

Honoré de Balzac, daguerreotype, 1848
J.E. Bulloz

fashionable or aristocratic women at this time, finally gaining that firsthand understanding of mature women that is so evident in his novels.

Between 1828 and 1834 Balzac led a characteristically tumultuous existence, spending his earnings in advance as a dandy and man-about-town. As a fascinating raconteur, he was fairly well received in society. But social ostentation was only a relaxation from phenomenal bouts of work—14 to 16 hours spent writing at his table in his white, quasi-monastic dressing gown, with his goose-quill pen and his exorbitant drinking of endless cups of black coffee. In 1832 Balzac became friendly with Eveline Hanska, a Polish countess who was married to an elderly Ukrainian landowner. She, like many other women, had written to Balzac expressing admiration of his writings. They met twice in Switzerland in 1833, the second time in Geneva, where they became lovers; then again in Vienna in 1835. They agreed to marry when her husband died, and so Balzac continued to conduct his courtship of her by correspondence; the resulting *Lettres à l'étrangère* ("Letters to a Foreigner"), which appeared posthumously (4 vol., 1889–1950), are an important source of information for the history both of Balzac's life and of his work.

To clear his debts and put himself in a position to marry Madame Hanska now became Balzac's great incentive. He was at the peak of his creative power. In the period 1832–35, he produced more than 20 works, including the novels *Le Médecin de campagne* (1833; *The Country Doctor*), *Eugénie Grandet* (1833), *L'Illustre Gaudissart* (1833; *The Illustrious Gaudissart*), and *Le Père Goriot* (1835), one of his masterpieces. Among the shorter works were *Le Colonel Chabert* (1832), *Le Curé de Tours* (1832; *The Vicar of Tours*), the trilogy of stories entitled *Histoire des treize* (1833–35; *History of the Thirteen*), and *Gobseck* (1835). Between 1836 and 1839, he wrote *Le Cabinet des antiques* (1839), the first two parts of another masterpiece, *Illusions perdues* (1837–43; *Lost Illusions*), *César Birotteau* (1837), and *La Maison Nucingen* (1838; *The Firm of Nucingen*). Between 1832 and 1837 he also published three sets of *Contes drolatiques* (*Droll Stories*). These stories, Rabelaisian in theme, are written with great verve and gusto in an ingenious pastiche of 16th-century language. During the 1830s he also wrote a number of philosophical novels dealing with mystical, pseudoscientific, and other exotic themes. Among these are *La Peau de chagrin* (1831; *The Wild Ass's Skin*), *Le Chef-d'oeuvre inconnu* (1831; *The Unknown Masterpiece*), *Louis Lambert* (1834), *La Recherche de l'absolu* (1834; *The Quest of the Absolute*), and *Séraphita* (1834–35).

In all these varied works Balzac emerged as

the supreme observer and chronicler of contemporary French society. These novels are unsurpassed for their narrative drive, their large casts of vital, diverse, and interesting characters, and their obsessive interest in and examination of virtually all spheres of life: the contrast between provincial and metropolitan manners and customs; the commercial spheres of banking, publishing, and industrial enterprise; the worlds of art, literature, and high culture; of politics and partisan intrigue; of romantic love in all its aspects; and the intricate social relations and scandals among the aristocracy and the haute bourgeoisie.

No theme is more typically Balzacian than that of the ambitious young provincial fighting for advancement in the competitive world of Paris. Balzac admired those individuals who were ruthless, astute, and, above all, successful in thrusting their way up the social and economic scale at all costs. He was especially attracted by the theme of the individual in conflict with society: the adventurer, the scoundrel, the unscrupulous financier, and the criminal. Frequently his villains are more vigorous and interesting than his virtuous characters. He was both fascinated and appalled by the French social system of his time, in which the bourgeois values of material acquisitiveness and gain were steadily replacing what he viewed as the more stable moral values of the old-time aristocracy.

These topics provided material largely unknown, or unexplored, by earlier writers of French fiction. The individual in Balzac's stories is continually affected by the pressure of material difficulties and social ambitions, and he may expend his tremendous vitality in ways Balzac views as socially destructive and self-destructive. Linked with this idea of the potentially destructive power of passionate will, emotion, and thought is Balzac's peculiar notion of a vital fluid concentrated inside the person, a store of energy that he may husband or squander as he desires, thereby lengthening or shortening his vital span. Indeed, a supremely important feature in Balzac's characters is that most are spendthrifts of this vital force, a fact that explains his monomaniacs who are both victim and embodiment of some ruling passion; avarice, as in the main character of *Gobseck*, a usurer gloating over his sense of power, or the miserly father obsessed with riches in *Eugénie Grandet*; excessive paternal affection, as in the idolatrous Learlike father in *Le Père Goriot*; feminine vindictiveness, as evidenced in *La Cousine Bette* and a half-dozen other novels; the mania of the art collector, as in *Le Cousin Pons*; the artist's desire for perfection, as in *Le Chef-d'oeuvre inconnu*; the curiosity of the scientist, as in the fanatical chemist of *La Recherche de l'absolu*; or the vaulting and frustrated ambition of the astonishingly resourceful criminal mastermind Vautrin in *Illusions perdues* and *Splendeurs et misères des courtisanes*. Once such an obsession has gained a hold, Balzac shows it growing irresistibly in power and blinding the person concerned to all other considerations. The typical structure of his novels from the early 1830s onward is determined by this approach: there is a long period of preparation and exposition, and then tension mounts swiftly to an inevitable climax, as in classical tragedy.

"*La Comédie humaine.*" The year 1834 marks a climax in Balzac's career, for by then he had become totally conscious of his great plan to group his individual novels so that they would comprehend the whole of contemporary society in a diverse but unified series of books. There were to be three general categories of novels: *Études analytiques* ("Analytic Studies"), dealing with the principles governing human life and society; *Études*

philosophiques ("Philosophical Studies"), revealing the causes determining human action; and *Études de mœurs* ("Studies of Manners"), showing the effects of those causes, and themselves to be divided into six kinds of *scènes*—private, provincial, Parisian, political, military, and country life. This entire project resulted in a total of 12 volumes (1834–37). By 1837 Balzac had written much more, and by 1840 he had hit upon a Dantesque title for the whole: *La Comédie humaine*. He negotiated with a consortium of publishers for an edition under this name, 17 volumes of which appeared between 1842 and 1848, including a famous foreword written in 1842. In 1845, having new works to include and many others in project, he began preparing for another complete edition. A "definitive edition" was published, in 24 volumes, between 1869 and 1876. The total number of novels and novellas comprised in the *Comédie humaine* is roughly 90.

Also in 1834 the idea of using "reappearing characters" matured. Balzac was to establish a pool of characters from which he would constantly and repeatedly draw, thus adding a sense of solidarity and coherence to the imaginary world he was superimposing on the real world. A certain character would reappear—now in the forefront, now in the background, of different fictions—in such a way that the reader could gradually form a full picture of him. Balzac's use of this device places him among the originators of the modern novel cycle. In the end, the total number of named characters in the *Comédie humaine* is estimated to have reached 2,472, with a further 566 unnamed characters.

In January 1842 Balzac learned of the death of Wenceslas Hanksi. He now had good expectations of marrying Eveline, but there were many obstacles, not the least being his inextricable indebtedness. She in fact held back for many years, and the period of 1842–48 shows Balzac continuing and even intensifying his literary activity in the frantic hope of winning her, though he had to contend with increasing ill health.

Balzac produced many notable works during the early and mid-1840s. These include the masterpieces *Une Ténébreuse Affaire* (1841; *A Shady Business*), *La Rabouilleuse* (1841–42; *The Black Sheep*), *Ursule Mirouët* (1841), and one of his greatest works, *Splendeurs et misères des courtisanes* (1843–47; *A Harlot High and Low*). Balzac's last two masterpieces were *La Cousine Bette* (1847; *Cousin Bette*) and *Le Cousin Pons* (1847; *Cousin Pons*).

In the autumn of 1847 Balzac went to Madame Hanksi's château at Wierzchownia and remained there until February 1848. He returned again in October to stay, mortally sick, until the spring of 1850. Then at last Eveline relented. They were married in March and proceeded to Paris, where Balzac lingered on miserably for the few months before his death.

Balzac did not quite realize his tremendous aim of making his novels comprehend the whole of society at that time. His projected scenes of military and political life were only partially completed, and there were certain other gaps, for instance in regard to the new class of industrial workers. Nevertheless, no novelist has thronged his pages with men and women drawn from so many different spheres, nor with characters so widely representative of human passions and frailties, projected with dynamic and convincing force.

Balzac was notable for his peculiar methods of composition. He often began with a relatively simple subject and a brief first draft, but fresh ideas came crowding in during composition until finally the story expanded far beyond his first intention. The trouble lay in the

fact that Balzac tended to expand and amplify his original story by making emendations after it had been typeset by the printers. The original skeleton of a story was thus filled out until it had reached the proportions of a full-length novel, but only at a ruinous cost of printer's bills to its author. Even when the novel was in print he would frequently introduce new variations on his theme, as successive editions appeared.

Balzac's method was almost invariably to reinforce, to emphasize and amplify. There are lengthy digressions in which he aired his remarkably detailed knowledge of legal procedures, financial manipulations, or industrial processes, but at its best his style is remarkably graphic, fast-moving and tersely epigrammatic but richly studded with sarcasm, wit, and psychological observation. His command of the French language was probably unrivaled, and he was also an outstanding master of dialogue. His sardonic humour saves his more pessimistic stories from being uniformly dark, and he had a real gift for comedy.

Balzac is regarded as the creator of realism, or naturalism, in the novel. He is openly acknowledged as the one who established the technique of the orthodox classical novel, in which consequent and logically determined events are narrated by an all-seeing observer and characters are coherently presented. Balzac had exceptional powers of observation and a photographic memory, but he also had a sympathetic, intuitive capacity to understand and describe other people's attitudes, feelings, and motivations. He was bent on illustrating the relation between cause and effect, between social background and character. His ambition was to "compete with the civil register," exactly picturing his contemporaries in their class distinctions and occupations. In this he succeeded; but he went even further in his efforts to show that the human spirit has power over men and events—to become, as he has been called, "the Shakespeare of the novel."

BIBLIOGRAPHY. Charles V. Spelberch de Lovénjoul, *Histoire des oeuvres de Honoré de Balzac*, 3rd rev. ed. (1888, reprinted 1968), is still indispensable for Balzacian research. See also William H. Royce, *A Balzac Bibliography: Writings Relative to the Life and Works of Honoré de Balzac* (1929, reprinted 1969). There are many excellent editions of Balzac's complete works. A complete, compact collection of Balzac's letters consists of Roger Pierrot (ed.), *Correspondence*, 5 vol. (1960–69), and *Lettres à Madame Hanksi*, 4 vol. (1967–71). Biographies include V.S. Pritchett, *Balzac* (1973, reprinted 1983), a concise introduction; André Maurois, *Prometheus: The Life of Balzac* (1965, reissued 1983); Herbert J. Hunt, *Honoré de Balzac* (1957, reprinted 1969); Théophile Gautier, *Honoré de Balzac* (1859, reissued 1980); and Ferdinand Brunetière, *Honoré de Balzac: 1799–1850* (1906, reprinted 1970). Among general works are Diana Festa-McCormick, *Honoré de Balzac* (1979), an introductory critical survey; Christopher Prendergast, *Balzac: Fiction and Melodrama* (1978), a comparative study of his novels; Samuel Rogers, *Balzac and the Novel* (1953, reissued 1969), a thoughtful work; Herbert J. Hunt, *Balzac's Comédie Humaine* (1959, reprinted 1964), a complete historical and analytical study that shows the work's expansion; Jules Bertaut (ed.), *Balzac* (1959), including an interesting tribute by Michel Butor; Philippe Bertault, *Balzac and The Human Comedy* (1963, originally published in French, 1946), a judicious general study by a great Balzacian scholar; Frederick W.J. Hemmings, *Balzac: An Interpretation of La Comédie Humaine* (1967), a perceptive analysis of Balzac in relation to his times; and Stefan Zweig, *Balzac*, 2nd ed. (1970; originally published in German, 1946), an assessment.

Balzac, Jean-Louis Guez de (b. 1597, probably in Balzac, near Angoulême, Fr.—d. Feb. 18, 1654, Balzac), man of letters and critic, one of the original members of the Académie Française; he had a great influence on the development of Classical French prose.

After studies in the Netherlands at Leiden (1615), some youthful adventures, and a period in Rome (1620–22), he hoped for a political career and wrote in defense of Cardinal de Richelieu's administration. When he saw, however, that Richelieu would not offer him preferment, he retired to his country house, from which he maintained relations with Parisian literary circles, chiefly by letter. Elected to the Académie Française in 1634, he rarely attended its sessions. His reputation, high in his lifetime, declined rapidly after his death. Balzac's published works include *Le Prince* (1631), a political treatise, and *Le Socrate chrétien* (1652), a synthesis of Stoic and Christian ethics. Far more influential, however, were the *Lettres* (short dissertations on political, moral, and literary matters), which appeared in numerous editions and were continually expanded from 1624.

bama (shrine): see high place.

Bamako, capital city, southwestern Mali, western Africa, on the Niger River. When occupied for the French in 1880 by Captain Joseph-Simon Gallieni, Bamako was a settlement of a few hundred inhabitants, grouped

Corner of the marketplace in Bamako, Mali
M. Renaudeau—De Wys, Inc.

in villages. It became the capital of the former colony of French Sudan in 1908, four years after the Kayes–Bamako segment of the Dakar–Niger Railway (now the Regie des Chemins de Fer du Mali) was opened.

Bamako now spans both sides of the Niger River, which is navigable 225 miles (360 km) south, to Kouroussa, Guinea, from mid-June to mid-December. To the north a canal around the Sotuba Rapids has opened the northeastern section of the river to shipping as far as Gao (869 miles [1,398 km]). Cement and petroleum products are shipped downstream from Bamako, with rice and groundnuts (peanuts) coming upstream for transshipment via the railway. The city is also served by an airport.

Bamako is a bustling city with a large market, botanical and zoological gardens, an active artisan community, and several research institutes. It also supports four colleges and houses the majority of Mali's industrial enterprises. The city more than tripled in size from 1960 to 1970, largely because of rural migration from drought-stricken areas of the countryside. A traditional character prevails, however, and mud brick buildings can still be seen throughout the city. Pop. (1996 est.) 809,552.

Bambara, ethnolinguistic group of the upper Niger region of Mali who speak a language called Bamana (or Bammana) of the Mande branch of the Niger-Congo family. The Bambara are to a great extent intermingled with other tribes, and there is no centralized organization. Each small district, made up of a number of villages, is under a dominant family, which provides a chief, or *fama*. The *fama* has considerable powers.

The Bambara are distinguished by their indigenous method of writing. They also have a remarkable system of metaphysics and cosmology, encompassing associated animistic

cults, prayers, and myths. Religious sculpture in wood and metal is well developed.

Mid-20th-century changes have included the introduction of cash crops, such as peanuts (groundnuts), rice, and cotton, into the pattern of subsistence agriculture; and there has been substantial migration to the towns.

Bambara states, two separate West African states, one of which was based on the town of Ségou, between the Sénégal and Niger rivers, and the other on Kaarta, along the middle Niger (both in present-day Mali). According to tradition, the Segou kingdom was founded by two brothers, Barama Ngolo and Nia Ngolo. Initially little more than marauding robber barons, the brothers settled sometime before 1650 near the market town of Ségou, on the south bank of the Niger. The Bambara empire extended to include Timbuktu during the reign (c. 1652–82) of Kaladian Kulibali, but it disintegrated after his death.

Mamari Kulibali, known as “the Commander” (reigned c. 1712–55), is regarded as the true founder of Segou; he extended his empire to what is now Bamako in the southwest and to Djénné and Timbuktu in the northeast by forming a professional army and navy and conquering other Bambara rivals and fighting off the king of Kong (c. 1730).

Mamari Kulibali's death was followed by a period of instability in which several rulers rose and fell in quick succession. Finally, in 1766, Ngolo Diara seized power and restored order to the empire, which he ruled for almost 30 years. Under his son Mansong and his grandson Da Kaba, the Bambara directed their attention southward to the region of the Black Volta River. In 1818 Bambara collapsed before the onslaughts of Shehu Ahmadu Lobbo of Macina.

Some of the rivals defeated by Mamari Kulibali fled to the middle Niger River region and founded (c. 1753) the city of Kaarta near Kumbi. There they created another group of Bambara states, which dominated the lands of the middle Niger into the 19th century.

Bamberg, city, Bavaria *Land* (state), south-central Germany. It lies along the canalized Regnitz River, 2 miles (3 km) above the latter's confluence with the Main, north of Nürnberg. First mentioned in 902 as the seat of the ancestral castle of the Babenberg family, Bamberg became the seat of a bishopric founded there by the Holy Roman emperor Henry II in 1007; the bishops became princes of the empire in the mid-13th century. In 1459 the first book in the German language was printed here. Bamberg passed to Bavaria in 1802 after the secularization of the see. An archbishopric was established in 1817. Bamberg's imperial cathedral (1004–1237) contains many notable statues, the tombs of Henry II, his wife Cunegund, and Pope Clement II, and a wooden altar carved by Viet Stoss. There

Rathaus (town hall) in Bamberg, Ger.

Karl Jung—ZEFA/EB Inc

are two bishops' palaces: the Alte Residenz, or old palace (1571–76), which houses a local history museum, and the splendid Neue Residenz (1695–1704), containing several notable art collections. Other historic buildings include the former Benedictine abbey and St. Michael's Church (consecrated 1015), the 12th-century St. Jacob's Church, St. Martin's (1685–93), the old town hall (1453; rebuilt 1744–56), the chapel of the ancient fortress on the Altenburg, and several Baroque patricians' houses. A former Jesuit university (1648–1803), later a theological academy, was united with a teachers college in 1972 to form a *Gesamthochschule* (a university-level institution for advanced technical training). Opposite the Civic Theatre is the E.T.A. Hoffmann house, where the poet and composer lived from 1808 to 1813. One of Bamberg's internationally known attractions is its symphony orchestra.

Bamberg's industries include the manufacture of electrotechnical equipment, clothing, shoes, machinery, pianos, and porcelain. There is extensive market gardening and brewing. Pop. (1989 est.) 69,809.

Bamberger, Ludwig (b. July 22, 1823, Mainz, Hesse [Germany]—d. March 14, 1899, Berlin), economist and publicist, a leading authority on currency problems in Germany. Originally a radical, he became at least partly converted to Bismarckian antiliberalism.

Bamberger, engraving by A. Neumann, c. 1890

Archiv für Kunst und Geschichte, Berlin

Born of Jewish parents, Bamberger was studying French law when the 1848 revolution inspired his radicalism. He became a newspaper editor, took part in the 1849 republican rising in the Palatinate, went into exile, and was condemned in absentia to death. Bamberger managed the Paris branch of a London bank until the amnesty of 1866 enabled him to return to Germany.

By then an admirer of Otto von Bismarck, Bamberger dissociated himself from all democratic groups. In 1870, at Bismarck's request, he participated in the Franco-German peace negotiations, and in 1871 he entered the Reichstag as a National Liberal.

Bamberger obtained the standardization of the German coinage, adoption of the gold standard, and establishment of the Reichsbank. Although he supported Bismarck's outlawing of the Socialist Party and attempts to nationalize the railways, Bamberger from 1878 opposed the chancellor's policy of protective tariffs, state socialism, and colonial expansion. In 1880 Bamberger left the National Liberal Party and helped to found the splinter party called the Sezession. For some years afterward he was the trusted adviser of the crown princess Victoria (wife of the future German emperor Frederick III).

Bambocciati, group of relatively small, often anecdotal, paintings of everyday life, made in Rome in the mid-17th century. The word derives from the nickname “Il Bamboccio” (“Large Baby”), applied to the physically malformed Dutch painter Pieter van Laer (1592/

95–1642). Generally regarded as the originator of the style and its most important exponent, van Laer arrived in Rome from Haarlem about 1625 and was soon well known for paintings in which his Netherlandish interest in the picturesque was combined with the pictorial cohesiveness of Caravaggio's dramatic tenebrist lighting. Because van Laer and his followers depicted scenes of the Roman lower classes in a humorous or even grotesque fashion, their works were condemned by both court critics and the leading painters of the classicist-idealist school as indecorous and ridiculous. The painter Salvator Rosa was particularly savage in his comments about the later followers of the style, whom he criticized for painting “baggy pants, beggars in rags, and abject filthy things.” The Bambocciati (painters of Bambocciati) influenced such Dutch genre painters as Adriaen Brouwer and Adriaen van Ostade.

bamboo, any of the tall, treelike grasses comprising the subfamily Bambusoideae of the family Poaceae. More than 75 genera and 1,000 species of bamboos have been proposed in botanical literature, but many names are synonymous and thus not considered legitimate.

Bamboos are giant, fast-growing grasses that have woody stems. They are distributed in tropical and subtropical to mild temperate regions, with the heaviest concentration and largest number of species in East and Southeast Asia and on islands of the Indian and Pacific oceans. A few species of bamboo belonging to the genus *Arundinaria* are native to the southern United States, where they form dense canebrakes along riverbanks and in marshy areas.

The woody, hollow aerial stems (culms) of bamboo grow in branching clusters from a thick underground stem (rhizome). The culms often form a dense undergrowth that excludes other plants. Bamboo culms can attain heights ranging from 10 to 15 cm (about 4 to 6 inches) in the smallest species to more than 40 m (about 130 feet) in the largest. Mature bamboos sprout horizontal branches that bear sword-shaped leaves on stalked blades; the leaves on young culms arise directly from the stem. Though the culms of some species grow quickly (as much as 1 foot [0.3 m] per day), most bamboos flower and produce seeds only after 12–120 years' growth, and then only once in their lifetime.

Bamboo
Sven Samelius

Bamboos are used for a great variety of purposes, especially in East and Southeast Asia. The seeds are eaten as grain, and the cooked young shoots of some bamboos are eaten as vegetables, especially in Chinese cuisines. The raw leaves are a useful fodder for livestock. The pulped fibres of several bamboo species,

especially *Dendrocalamus strictus* and *Bambusa arundinacea*, are used to make fine-quality paper. The jointed stems of bamboo have perhaps the most numerous uses; the largest stems supply planks for houses and rafts, while both large and small stems are lashed together to form the scaffoldings used on building-construction sites. The stems are also split up to make buckets and pipes or are used to make furniture, walking sticks, fishing poles, garden stakes, and other utensils. Some species of bamboo are used as ornamentals in landscape gardens. The fine-grained silica produced in the joints of bamboo stems has been used as a medicine in the Orient for centuries under the name *tabasheer*.

Bamboo Annals, Chinese (Wade-Giles romanization) CHU-SHU CHI-NIEN, Pinyin ZHUSHU JINIAN, set of records written on bamboo slips, from the state of Chin, one of the many small states into which China was divided during the late, or Eastern, Chou dynasty (770–256/255 BC). The Chin state was destroyed about the middle of the 5th century BC, and the state records were hidden in a tomb sometime later. Uncovered in AD 279, when the use of bamboo slips had already gone out of style, the records acquired the name under which they have since been known.

The *Bamboo Annals* contain one of the few written records of the earliest period in Chinese history, but the originals have been lost, and the later copies that survive have been proved to contain much spurious information.

bamboo rat, any of several species of burrowing Asiatic rodents of the genera *Rhizomys* and *Cannomys*, belonging to the family Rhizomyidae (order Rodentia). Bamboo rats are thickest, short-legged, and short-tailed, with gray, grayish brown, or reddish brown fur. Members of the genus *Rhizomys* are 25 to 40 cm (10 to 16 inches) long, exclusive of the tail. The lesser, or chestnut, bamboo rat (*C. badius*) is smaller, about 17 to 25 cm long without the tail. Bamboo rats burrow with their teeth and claws. They eat bamboo but also take fruit, seeds, and other plant material. Members of the genus *Rhizomys* are found in bamboo-covered areas of southeastern Asia and the Malay Peninsula. The lesser bamboo rat lives in gardens, forests, and grassy regions of southern and southeastern Asia.

Bamburgh, coastal village, Berwick-upon-Tweed borough, historic county of Northumberland, Eng. The site is dominated by Bamburgh Castle on its cliff, 150 feet (45 m) high. The fortress was founded in the 6th century by Ida, first monarch of the Anglo-Saxon kingdom of Bernicia, and subsequently remained the principal stronghold of the kings

The castle at Bamburgh, Northumberland, across the village green

A.F. Kersting

of Northumbria and then of their feudal successors, the earls of Northumberland. It was rebuilt after the Norman Conquest (1066), and its keep and later walls still dominate the village. The parish church—dedicated to St. Aidan, who founded the original building and died there in 651—became an Augustinian monastery (1121). Pop. (1981) 423.

Bambutu (people): see Mbuti.

Bamenda, town, northwestern Cameroon. It is situated in the volcanic Bamenda highlands. Although communications are difficult because of heavy rainfall and rugged relief, the town serves as a trade and export centre for local agricultural products such as hides, coffee, and tobacco.

The Bamenda Museum displays specimens of local handicrafts. The German fort (c. 1912)

The Bamenda highlands, Cameroon

Syndication International Ltd., London

is a relic of the colonial period. A nurses' training centre and hospital serve the town, and the Cameroon College of Arts, Science, and Technology is located at nearby Bambili. Pop. (1991 est.) 110,000.

Bamford, Samuel (b. Feb. 28, 1788, Middleton, Lancashire, Eng.—d. April 13, 1872, Harpurhey, Lancashire), English radical reformer who was the author of several widely popular poems (principally in the Lancashire dialect) showing sympathy with the condition of the working class. He became a working weaver and earned great respect in northern radical circles as a reformer.

Bamford formed a Hampden Club in Middleton in 1817 and met William Cobbett, Henry Hunt, William Benbow, and Sir Francis Burdett. In 1819 he was arrested as a result of attending and speaking at the Manchester meeting known as Peterloo and was sentenced to 12 months imprisonment. Bamford became a journalist in London in about 1826. He continued to press for the reform of working-class conditions, on which his *Passages in the Life of a Radical* (1840–44) and *Early Days* (1849) are illuminating. On his death he was accorded a public funeral that was attended by thousands.

Bāmīān, also spelled BĀMYĀN, town, central Afghanistan. It lies northwest of Kābul, the nation's capital, in the Bāmīān valley at an elevation of 8,495 feet (2,590 m).

Bāmīān is first mentioned in 5th-century-AD Chinese sources and was visited by the Chinese travelers Fa-hsien around AD 400 and Hsüan-tsang in AD 630; it was by that time a centre of commerce and of the Buddhist religion. Two great figures of Buddha were erected there during this period; the larger was 175 feet (53 m) high and the smaller was 120 feet. These statues were carved from the living rock and were finished with fine plaster. When Hsüan-tsang saw the figures, they were decorated with gold and fine jewels. The two Buddha figures, together with numerous ancient man-made caves in the cliffs north of the town, made Bāmīān a major Afghan archaeological site. However, in 2001, soldiers of the ruling Taliban faction destroyed the two Buddha figures under orders from leader Mohammad Omar, who declared all statues

idoltrous. The caves are of various forms, and the interiors of many bear traces of fine fresco painting that links them with contemporary caves in Sinkiang, China; some of

The Bāmīān valley, Afghanistan, showing the ancient caves before destruction of the Buddha statues

Richard Abeles

these frescoes were also lost sometime before 2001.

The modern town lies below the caves. The town was ruled in the 7th century by princes, probably Hephthalite, but was subject to the Western Turks. The rulers first accepted Islām in the 8th century. The Šaffārid ruler Ya'qūb ibn Leyš captured Bāmīān in 871; after changing hands several times, it was destroyed and its inhabitants exterminated in 1221 by the Mongol invader Genghis Khan. Since that time it has never regained its former glory. In 1840 Bāmīān was the scene of fighting in the First Anglo-Afghan War. Pop. (1988 est.) 8,700.

Bamileke, any of about 90 West African peoples in the Bamileke region of Cameroon. They speak a language of the Benue-Congo branch of the Niger-Congo family. They do not refer to themselves as Bamileke but instead use the names of the individual kingdoms to which they belong or else refer to themselves as "grasslanders." Their origin is uncertain, but it appears that under pressure from Fulani invasions in the 17th century they moved southward in a series of migrations from the region that is now occupied by the Tikar people.

Each of their kingdoms was ruled by a king (*fon*) whose position was hereditary within a localized patrilineal lineage. Some of these kings were assisted by a queen mother (*mafo*). Descent, succession, and inheritance are patrilineal among the Bamileke. Polygyny is practiced, marriage often involving a substantial bride-price. The Bamileke practice sedentary farming. Their staple crops include corn (maize), taro, and groundnuts (peanuts). Men clear the fields, build houses, and engage in crafts, while women do most of the cultivating. They have little livestock.

Settlement patterns typically take the form of neighbourhoods of scattered family homesteads. Their square houses have conical thatched roofs surmounting latticework walls, made of raffia poles with mud-filled interstices. Chiefs' houses are decorated with carved doorframes and house posts; a wide variety of articles was at one time skillfully carved by the Bamileke from wood, ivory, and horn. The Bamileke have played an important role in the economic development of Cameroon as professionals, traders, artisans, and labourers. In the late 20th century, they numbered about 2,120,000.

Ancestor worship is the dominant form of religion; the lineage head preserves the ancestral skulls and offers sacrifices to them. Charms and medicines are prepared by doctors, who also practice divination by interpreting an earth spider's manipulation of marked blades of grass. Some Bamileke have adopted Islām, especially in the north; and others have been converted to Christianity.

Bampton, John (b. 1690?—d. June 2, 1751), English clergyman who gave his name to one of Protestant Christendom's most distinguished lectureships, the Bampton lectures at Oxford University.

Bampton studied at Trinity College, Oxford, and was a prebendary of Salisbury Cathedral from 1718 until his death. The Bampton lectures were established in accordance with his will. They consist of eight lecture-sermons preached on Sunday mornings between the beginning of the last month in Lent term and the third week in Act term, upon specified topics of Christian doctrine. The lecturer is chosen by the heads of colleges during Easter term. Since 1895 the Bampton lectures have been given every other year.

Also supported by the Bampton fund are the "Sarum lectures," which were established to enable other than Anglican theologians to lecture.

Bamum, also spelled BAMOUN, also called MUM, a West African people speaking a language that is often used as a lingua franca and belongs to the Benue-Congo branch of the Niger-Congo family. Their kingdom, with its capital at Foumban (*q.v.*) in the high western grasslands of Cameroon, is ruled over by a king (*mfon*) whose position is hereditary within one of the exogamous patrilineal lineages. The *mfon* rules with the help of his queen mother (*na*).

The first *mfon*, Nchare, and his followers are believed to have come from the territory of the neighbouring Tikar people early in the 18th century. Settling among the Bamileke people and among other Tikar, Nchare proclaimed himself king and established his palace at Foumban. The 11th *mfon*, Mbuembue, was the first to enlarge the kingdom, and, following an attack by the Fulani in the early 19th century, he fortified Foumban with a surrounding wall and ditch.

The 16th *mfon*, Njoya (reigned *c.* 1895–1923), became the most celebrated of all the Bamum kings. Familiar with writing in Arabic script from his contact with the Fulani and Hausa peoples, Njoya in about 1895 invented a system of writing with 510 pictographic characters. This he revised six times, the seventh system being a syllabary of 83 characters plus 10 numerals. With the help of his scribes Njoya prepared a book on the history and customs of the Bamum, which has been published in a French translation. He also had made a map of his country, a religious book, and a book on medicine and local pharmacopoeia. In 1912 he established the first of 47 schools to teach the Bamum reading and writing in his sixth script, and in 1913 he commissioned a member of his court to prepare a printing press using it. In 1920, annoyed by his troubles with the French colonial administration that was to depose him in 1923, Njoya destroyed the type, which had been cast by the lost-wax method, and closed his schools. Njoya was converted to Islām in 1918, and it is estimated that more than half of the Bamum have become Muslims.

Njoya built a beautiful new palace, established what was in effect a museum, and was a patron of beadworkers, brass casters, weavers, dyers, and other craftsmen. His palace contained 300 looms and six dye pits with different colours, some of the dyes for which Njoya himself discovered. The arts flourished under his royal patronage.

The Bamum are noted craftsmen. The men do embroidery, weaving, leatherwork, wood carving, ivory carving, metalwork, and blacksmithing, and the women make pottery. Both men and women cultivate the land. The Bamum are sedentary farmers who do some fishing but little hunting. Their principal crops are corn (maize), millet, cassava, and sweet potatoes.

They believe in a supreme god who creates

children, and they practice ancestor worship. Bamum doctors practice divination by interpreting the earth spider's manipulation of marked leaves.

Bāmīyān (Afghanistan): *see* Bāmīān.

ban, former Hungarian title denoting a governor of a military district (*banat*) and later designating a local representative of the Hungarian king in outlying possessions, *e.g.*, Bosnia and Croatia. Originally a Persian word, *ban* was introduced into Europe by the Avars. The Kingdom of Yugoslavia, divided into *banovine*, or provinces, revived the title and office of *ban* in October 1929 and used it until the German-Italian invasion of April 1941.

ban (South African law): *see* banning.

Bāṇa, also called BĀṆABHAṬṬA (fl. first half of 7th century), one of the greatest masters of Sanskrit prose, famed principally for his chronicle, *Harṣacarita* ("Deeds of Harṣa"), depicting the court and times of the Buddhist emperor Harṣa (reigned *c.* 606–647) of northern India.

Bāṇa gives some autobiographical account of himself in the early chapters of the *Harṣacarita*. He was born into an illustrious family of Brahmans; his mother died when he was a small child, and he was raised by his father with loving care. His father died, however, when Bāṇa was 14, and for some years he traveled adventurously, visiting various courts and universities with a colourful group of friends (including his two half brothers by a lower caste woman, a snake doctor, a goldsmith, a gambler, and a musician). At last he returned home and married; then one day he was called to the court of Harṣa. Treated coolly at first by the Emperor, perhaps because of some gossip about his wayward youth, in time he won the Emperor's high regard.

Bāṇa's biography of Harṣa provides valuable information about the period, though with some obvious exaggeration in the Emperor's favour. Written in the ornate *kāvya* style, involving extremely lengthy constructions, elaborate descriptions, and poetic devices, the work has great vitality and a wealth of keenly observed detail. His second great work, the prose romance *Kādambarī*, involves narrative within narrative, related to a king by a parrot; it is remarkable for the freshness with which it deals with the emotions of love. Both works were left unfinished; the second was completed by the author's son, Bhūṣaṇabhaṭṭa.

Banaba, also called OCEAN ISLAND, coral and phosphate formation 250 miles (400 km) west of the nearest Gilbert Islands, part of Kiribati, in the west central Pacific Ocean. It has a circumference of 6 miles and an area of 2 square miles (6 square km). Sighted in 1804 by the British ship *Ocean*, the island was annexed by Britain in 1900. In that same year the mining and shipping of phosphate from the island began. By the early 1970s, annual production reached a high of 550,000 tons, but deposits were exhausted by 1979. Made part of the crown colony of the Gilbert and Ellice Islands in 1919, the island was occupied by Japanese forces from 1942 to 1945. The Japanese deported many of the local Micronesian inhabitants (including both Banabans and Gilbertese) to the Gilbert Islands and in 1945 massacred all but one of the remaining Gilbertese left there.

Many of the Banabans who had been deported to the Gilberts later elected to move to Rabi, a small island 1,300 miles southeast of Banaba, in Fiji, after wartime destruction at Banaba made living conditions there impossible. After 1965, Banabans received more adequate compensation from the phosphate company for the exploitation of their island. During the 1970s Banabans attempted to separate from the Gilbert Islands, which was nearing independence as part of Kiribati. Since independence (in 1979) they have been guaranteed ownership of Banaba, as well as dual citizenship in both Kiribati and Fiji. Tabiang is the administrative seat. Pop. (1985) Banaba, 46; (1977) Rabi Island, Fiji (almost all Banabans), 2,426.

Banach, Stefan (b. March 30, 1892, Kraków, Austria-Hungary [now in Poland]—d. Aug. 31, 1945, Lvov, Ukrainian S.S.R.), Polish mathematician who founded modern functional analysis and helped develop the theory of topological vector spaces.

A lecturer in mathematics at the Institute of Technology, Lvov, from 1919, Banach became a lecturer at the University of Lvov in 1922 and a full professor in 1927. He contributed to the theory of orthogonal series and made innovations in the theory of measure and integration, but his most important contribution was in functional analysis. Of his published works, his *Théorie des opérations linéaires* (1932; "Theory of Linear Operations") is the most important. Banach and his coworkers summarized the previously developed concepts and theorems of functional analysis and integrated them into a comprehensive system. Banach himself introduced the concept of normed linear spaces, which are now known as Banach spaces. He also proved several fundamental theorems in the field, and his applications of theory inspired much of the work in functional analysis for the next few decades.

Banana, port on the Atlantic coast in far southwestern Zaire, central Africa, at the mouth of the Congo (Zaire) River. One of the nation's older towns, it was known as a trading centre in the 19th century, mainly during the slaving period. In the 1970s and 1980s its port was developed to increase its facilities as a deepwater port, and a rail line was built to link Banana with Boma and Kinshasa, the national capital. Banana lies in deltaic mangrove forests, but northward along the coast lie some beaches, near which is Moanda, an offshore oil centre. Pop. (latest est.) 2,000.

banana, fruit of the genus *Musa*, of the family Musaceae, one of the most important

Banana (*Musa cavendishii*)

Ingmar Holmasen

food crops of the world. The banana is consumed extensively throughout the tropics, where it is grown, and is also valued in the temperate zone for its flavour, nutritional value, and availability throughout the year. The plant is a gigantic herb that springs from an underground stem, or rhizome, to form a false trunk 3–6 m (10–20 feet) high. This trunk is composed of the basal portions of leaf sheaths and is crowned with a rosette of 10 to 20 oblong to elliptic leaves that sometimes attain a length of 3–3.5 m (10–11.5 feet) and a breadth of 65 cm (26 inches).

A large flower spike, carrying numerous yellowish flowers, emerges at the top of the false trunk and bends downward to become bunches of 50 to 150 individual fruits, or fingers. The individual fruits, or bananas, are grouped in clusters, or hands, of 10 to 20. After a plant has fruited it is cut down to the ground, because each plant produces only one bunch of fruit. The dead plant is replaced by others in the form of suckers, or shoots, which arise from the underground stem at roughly six-month intervals. The life of one underground stem thus continues for many years, and the weaker suckers that it sends up through the soil are periodically pruned, while the stronger ones are allowed to grow into fruit-producing plants.

There are hundreds of varieties of banana in cultivation; confusion exists because of diverse names applied to one and the same variety in different parts of the world. Perhaps the most important species is the common banana, *M. sapientum*; this type has several varieties, the most widely consumed of which is the Gros Michel. Consumption of the banana is mentioned in early Greek, Latin, and Arab writings. Alexander the Great saw bananas on an expedition to India. Shortly after the discovery of America, the banana was brought from the Canary Islands to the New World, where it was first established in Hispaniola and soon spread to other islands and the mainland. Cultivation increased until it became a staple foodstuff in many regions, and in the 19th century it began to appear in the markets of the United States.

Banana plants thrive naturally on deep, loose, well-drained soils in humid tropical climates, and they are grown successfully under irrigation in such semiarid regions as the southern side of Jamaica. Suckers and divisions of the pseudo-bulb are used as planting material; the first crop ripens within 10 to 15 months, and thereafter fruit production is more or less continuous. Frequent pruning is required to remove surplus growth and prevent crowding in a banana plantation.

Desirable commercial bunches of bananas consist of nine hands or more and weigh 22–65 kg (49–143 pounds). Three hundred or more such bunches may be produced annually on one acre of land. The ripe fruit contains as much as 22 percent of carbohydrate, mainly as sugar, and is high in potassium, low in protein and fat, and a good source of vitamins C and A. A ripe banana is 75 percent water. Though most commonly eaten fresh, bananas may be fried or mashed and chilled in pies or puddings. They may also be used to flavour muffins, cakes, or breads.

Cooking varieties, or plantains (*M. paradisiaca*), differ from other bananas in that the ripe fruit is starchy rather than sweet. They are extensively cultivated and used in tropical regions and are marketed in large urban areas worldwide (see plantain). The United States imports more bananas than any other country; large quantities are also shipped to Great Britain and western Europe.

Even for local consumption, bananas are not allowed to fully ripen on the plant. For export, the desired degree of maturity attained before

harvest depends upon distance from market and type of transportation. Frequently, ripening is artificially induced after shipment by exposure to ethylene gas.

Specially designed refrigerated ships transport bananas from tropical countries to consumption centres in North America and Europe. The chief producers of bananas in Middle America and the West Indies are Costa Rica, Honduras, Guatemala, Mexico, Panama, the Dominican Republic, Guadeloupe, Jamaica, and Martinique; in South America, Brazil, Colombia, and Ecuador; in Africa, Spain's Canary Islands, Ethiopia, Cameroon, Guinea, and Nigeria; and in Asia, Taiwan.

banana fish: see bonefish.

banana wilt (plant disease): see Panama disease.

Bananal Island, Portuguese ILHA DO BANANAL, island, Tocantins estado ("state"), central Brazil. The island is formed by the Araguaia River, which for 200 miles (320 km) divides into major (western) and minor (eastern) branches, with Bananal Island lying between them. The major branch of the Araguaia forms part of the boundary between Mato Grosso and Tocantins states. Small boats navigate the minor branch. The island (maximum width 35 miles [55 km]) is the habitat of babassu palms, tropical birds, and freshwater fish. Suyá Indians live on Bananal Island. It became the Araguaia National Park in 1959 and includes an airstrip.

bananaquit (*Coereba flaveola*), bird of the West Indies (except Cuba) and southern Mexico to Argentina. It is usually placed with honeycreepers in the family Emberizidae (order Passeriformes), but it may belong with wood-warblers (Parulidae). About 11 cm (4.5 inches) long, the bananaquit is blackish above and yellow below, with white stripes near the eyes and white patches on the wings. It uses its sharp curved bill to probe flowers for nectar; sometimes it eats insects and fruit. It uses banana-leaf fibre to make its domed nest.

Banāras (India): see Vārānasi.

Banaras, Treaties of (1773; 1775), two agreements regulating relations between the British government of Bengal and the ruler of the Muslim state of Oudh. The defense of Oudh had been guaranteed in 1765 on the condition that the state's ruler, Shujā'-ud-Dawlah, pay the cost of the necessary troops. The First Treaty of Banaras (1773) was the result of the Mughal emperor Shāh 'Ālam's cession of Allāhābād and Kora to the warlike Marāthās as the price of their support. Warren Hastings, the British governor, ceded Allāhābād and Kora to Shujā and promised to support him against the menacing Afghan Rohillas in return for cash payments. This move, designed to strengthen Oudh as a buffer state between Bengal and the Marāthās, led to the Rohilla War of 1774, which later became a major factor in Hastings' impeachment (1788–95).

The Second Treaty of Banaras is otherwise known as the Treaty of Faizābād (1775). It was forced on the new vizier of Oudh by the company's governing council after the death of Shujā. The vizier had to pay a larger subsidy for the use of British troops and to cede Banaras to the company. This treaty led to a revolt by the raja Chaith Singh of Banaras in 1781.

Consult the INDEX first

Banās River, river in Rājasthān state, north-western India. It rises near Kūmbhalgarh and cuts its way tortuously through the Arāvalli Range. It then flows in a northeasterly course onto the plains and joins the Chambal River, just north of Sheopur, after a course of 310

miles (500 km). The Banās is a seasonal river that is often dry in the hot months, but it is still a source of irrigation. Its main tributaries are the Berach and Kotari rivers.

Banat, ethnically mixed historic region of eastern Europe; it is bounded by Transylvania and Walachia in the east, by the Tisza River in the west, by the Mures River in the north, and by the Danube River in the south. After 1920 Banat was divided among the modern states of Romania, Yugoslavia (now Serbia and Montenegro), and Hungary. The name banat has its origin in a Persian word meaning lord, or master, and was introduced into Europe by the Avars; it came to mean a frontier province or a district under military governorship.

First occupied in prehistoric times, the Banat was later controlled by the Romans, Goths, Gepidae, Huns, and Avars. The Slavs settled there in the 5th century AD, and after the Magyars displaced them (9th century), the area became an integral part of Hungary and was organized as the Banat of Severin (Terra de Zevrino) by King Andrew II in 1233. In the 14th and 15th centuries many Serbs settled there; in the mid-16th century it was conquered by the Ottoman Turks, who retained it until 1718, when Austria acquired it (Treaty of Passarowitz).

Under Austrian military rule, the region was organized as the Temeser Banat (or Banat of Temesvár). Later a civil administration took control of the northern part of the area, and the Austrian rulers encouraged the settlement of colonists from the Rhineland, Lorraine,

Banat in the mid-16th century

and Luxembourg. For most of the period from 1779 to 1920, the Banat was attached to Hungary. After World War I, the victorious Allies divided it by the Treaty of Trianon (June 4, 1920). Hungary retained the district of Szeged, Romania acquired the large eastern section, and the remainder went to Yugoslavia.

Banbridge, Irish DROICHEAD NA BANNA, town, seat, and district (established 1973), formerly within County Down, N.Ire. Located on the River Bann, the town of Banbridge came into existence following the building of a stone bridge across the river in 1712. It is the main agricultural and population centre of the region; manufactures include linen, light footwear, and motor vehicle components. Much of the land in the surrounding area is utilized for crops, including oats, potatoes, and barley, or as pasture for livestock (mostly pigs). Primary roads connect the town of Banbridge with the towns of Lisburn to the north and Newry to the south.

Banbridge district has an area of 172 square miles (445 square km) and is bordered by the districts of Armagh to the west, Craigavon and Lisburn to the north, Down to the east, and Newry and Mourne to the south. Reaching an altitude of 1,745 feet (532 m) at Slieve Croob in eastern Banbridge district, the Legananny Hills slope gradually southward to rolling lowlands that are dissected by the River Bann and its tributaries in central Banbridge and then to Newry Canal

valley in the western part of the district. Limestone is quarried in the northwest. Pop. (1981) town, 9,650; (1990 est.) district, 32,100.

Banbury, town, Cherwell district, administrative and historic county of Oxfordshire, Eng. It lies along the River Cherwell. For centuries Banbury was noted for its ale, cheese, and Banbury cakes, a spiced currant pastry. Part of the original 16th-century cake house remains, together with several timbered and stone houses. The original Banbury Cross, celebrated in the nursery rhyme, was destroyed by Puritans in 1602 but was replaced in 1858. Banbury Castle (1125) was twice besieged by Parliamentarians during the English Civil Wars of the mid-17th century and was later demolished. Broughton Castle (14th–16th century) lies 2.5 miles (4 km) to the southwest. Banbury market is noted for its cattle sales. The town is expanding as a centre for the overspill population of Greater London and is increasingly important for light industry, commerce, and tourism. Pop. (1991) 39,906.

Banca (Indonesia): see *Bangka*.

Banchieri, Adriano (b. Sept. 3, 1568, Bologna, Papal States [Italy]—d. 1634, Bologna), one of the principal composers of madrigal comedies, choral pieces that suggest plots and action to be imagined by the performers and listeners.

He spent almost his whole life at the monastery of San Michele in Bosco, near Bologna, becoming abbot in 1620. Banchieri was second only to Orazio Vecchi as a composer of madrigal comedies, a genre much in fashion shortly before the rise of opera. His *Il festino nella sera del giovedì grasso avanti cena* (1608; modern English edition, *The Animals Improvise Counterpoint*, 1937) contains some delightful characterizations.

Banco National Park, French *PARC NATIONAL DU BANCO*, national park, southeastern Côte d'Ivoire (Ivory Coast). It lies immediately north of Abidjan, the national capital. Declared a national park in 1953, Banco preserves both flora and fauna in some 116 square miles (300 square km). Gigantic rainforest trees occupy most of the park; an arboretum displays trees (especially teak) and shrubs from throughout the country. African civet, genet, bushbuck, duiker, and monkey roam the park in a natural environment and live with little or no human interference. The park serves primarily as a recreational centre for the inhabitants of Abidjan.

Bancroft, village, Hastings county, in the hills of southeastern Ontario, Can. Bancroft lies 60 miles (95 km) northeast of Peterborough. It originated as a farming settlement called York River in 1855 but later became a lumbering community and was renamed in 1878 for Phoebe Bancroft, wife of Senator Billa Flint, a prominent Canadian politician of the late 1800s. It became a centre for rock collectors, with examples of about 80 percent of Canada's minerals found in the vicinity; the annual Bancroft Gembooree attracts many rock collectors. The village's economic activities focus on woolen milling, quarrying, lumbering, dairying, and tourism. Pop. (1996) 2,554.

Bancroft (Zambia): see *Chililabombwe*.

Bancroft, Edward (b. Jan. 9, 1744, Westfield, Mass. [U.S.]—d. Sept. 8, 1821, Margate, Kent, Eng.), secretary to the American commissioners in France during the American Revolution who spied for the British.

Although he had no formal education, Bancroft assumed the title and style of "Doctor." In 1769 he established his credentials as a scientist with the publication of his "Essay on the Natural History of Guiana." About 1770 he went to England, where he became friendly with Benjamin Franklin during one of Franklin's early missions to London. Ban-

croft became an adherent of the American cause and returned to the Colonies. As a result of his friendship with Franklin he accompanied Franklin and the two other American commissioners to France in 1776. In France Bancroft was contacted by Paul Wentworth, an American-born Loyalist who headed a ring of Loyalist spies for the British. By December of that year he had begun receiving a salary from the British. Between 1777 and 1783 he reported every movement of Franklin and the other Americans to the British, writing his reports in invisible ink and relaying them by means of a dead drop. Bancroft's information included the details of treaties and the movement of ships and troops from France to America. To avoid suspicion Bancroft made several trips to Britain ostensibly to spy on the British; they provided him with harmless or false information and once pretended to arrest him. In 1783 Bancroft moved to England, primarily to preserve his British citizenship and the pension due him for his secret service. He continued to correspond with Franklin, who never suspected him. He invented several processes for dyeing textiles and in 1794 wrote a work called "Experimental Researches concerning the Philosophy of Permanent Colors." He gained international fame as a chemist and was made a fellow of the Royal Society. Not until nearly 70 years after his death did his role as a British spy become public knowledge.

Bancroft, George (b. Oct. 3, 1800, Worcester, Mass., U.S.—d. Jan. 17, 1891, Washington, D.C.), American historian whose comprehensive 10-volume study of the United States' origins and development caused him to be referred to as the "father of American history."

George Bancroft, photograph by Mathew Brady
By courtesy of the Library of Congress, Washington, D.C.

Bancroft's life presented a curious blend of scholarship and politics. Although he was educated at Harvard and several German universities, he initially eschewed an academic career for an eight-year experiment in elementary education at Round Hill, his private school for boys at Northampton, Mass. (1823–31). He then turned to anti-Masonic and Democratic politics in Massachusetts. He received his first patronage post as collector of the Port of Boston (1838) and became U.S. secretary of the navy (1845–46) and minister to England (1846–49). Though not an Abolitionist, Bancroft broke with the Democrats over the slavery issue in the 1850s and shifted his support to the Republican Party. As a result, he served as minister to Prussia (1867–71) and to the German Empire (1871–74). While in Germany he became closely identified with the German intellectual community.

Throughout his lifetime he fitted his research and writing around his political requirements, so that the compilation of his 10-volume

History of the United States extended over a period of 40 years (1834–74). With a few exceptions, earlier American historians had been collectors or annalists, concerned chiefly with state or Revolutionary War histories. Bancroft was the first scholar to plan a comprehensive study of the nation's past, from its colonial foundations through the end of its struggle for independence. Influenced by the nationalistic German school of historians, he approached his subject philosophically, molding it to fit his preconceived thesis that the American political and social system represented the highest point yet reached in humanity's quest for the perfect state. He placed great emphasis on the use of original sources, building a vast collection of documents and hiring copyists to translate materials from European archives.

Many critics thought that, in the first three volumes (1834–40), the writer was too strongly influenced by the political attitudes of President Andrew Jackson. Nevertheless, Bancroft's reputation as the country's leading historian was firmly established by 1850. Seven succeeding volumes were published between 1852 and 1874. A revised centenary edition (1876) reduced the number of volumes to six, but the author's basic approach to American history remained unchanged. A still later edition (1885) included a two-volume study, *The History of the Formation of the Federal Constitution* (1882).

Although Bancroft neglected economic and social forces and wrote what are essentially political and military narratives, he was nevertheless the first to recognize the importance of the colonial period, foreign relations, and the frontier as forces in the history of the United States.

Bancroft, Hubert Howe (b. May 5, 1832, Granville, Ohio, U.S.—d. March 2, 1918, Walnut Creek, Calif.), historian of the American West who collected and published 39 volumes of materials on the history and peoples of western North America. His work remains one of the great sources of information on the West.

Born into a sternly religious and hard-working family, Bancroft abandoned formal education at the age of 16, after a brief enrollment in a local academy. His father went to California to pan for gold in 1850, and Bancroft followed him two years later. By 1856 he had opened a bookshop in San Francisco and had traveled extensively, both in America and in Europe. His firm became the largest book-selling business in the West. In 1859 he began to collect California materials, and he soon expanded his interest to include western America from Panama to Alaska. His collection eventually included some 60,000 volumes.

About 1870 Bancroft conceived the idea of writing an encyclopaedic history of the American West, which he implemented by utilizing the skills of relatively untrained collaborators to index the massive documentation and work on special projects. Their combined effort resulted in the largest collection of information on the American West.

To himself Bancroft assigned the task of writing *The Native Races of the Pacific States of North America*, 5 vol. (1875–76), a description of indigenous ethnic groups, still useful to anthropologists. The remaining volumes include histories of the western Americas from Central America to Alaska, covering such various subjects as Mormonism in Utah and the colonization of Alaska by Russia.

After completing the first five volumes on *The Native Races* and the next 28 volumes on the settlement and history of the Western states, Bancroft wrote an additional five volumes on the history of California between 1769 and 1848, including the settling of San

Francisco, and a defense of vigilante committees in the West; the latter is considered one of his best monographs. The 39th volume in the set is *Literary Industries* (1890), his autobiography. Through an extensive publicity campaign, he achieved a gross return of more than \$1,000,000. On Nov. 25, 1905, he sold his entire library to the University of California at Berkeley for \$250,000. His writing included *The New Pacific* (1898), in which he argued in favour of U.S. imperialism in the West.

Although marred by a general lack of careful scholarship and editing, Bancroft's library made available to scholars a great amount of historical material, with a broad emphasis on cultural and social interchange in the origin and development of nations. Although he failed to identify his helpers, their contribution serves as a model for cooperative writing in large projects of historical research. Bancroft's histories are still considered a generally accurate and valuable source on the history of the Far West. Further biographical information may be found in his *Literary Industries* and in J.W. Caughey's *Hubert Howe Bancroft, Historian of the West* (1946).

Bancroft, Sir Squire (b. May 14, 1841, London—d. April 19, 1926, London), British actor and manager whose espousal of careful craft in the writing and staging of plays did much to lay the foundations of modern theatrical production.

Sir Squire Bancroft
BBC Hulton Picture Library

Left fatherless at an early age, Bancroft was educated privately in England and France. He first appeared on the stage in Birmingham in 1861 and played in the provinces before his London appearance in 1865. He married the theatre manager Marie Effie Wilton in 1867. At the Prince of Wales's Theatre they produced all the better known comedies of Thomas William Robertson, among them *Society* (1865) and *Caste* (1867). These productions swept away the old crude methods of writing and staging. Later they produced new plays and revivals, such as Bulwer-Lytton's *Money*, Dion Boucicault's *London Assurance*, and an adaptation of Sardou's *Théodora*, entitled *Diplomacy*. In 1880 they moved to the Haymarket Theatre and continued a brilliant career until their retirement from management in 1885. Bancroft played with Henry Irving in 1889 and was knighted in 1897. Together the Bancrofts wrote *Mr. and Mrs. Bancroft on and off the Stage* (1888) and *The Bancrofts: Recollections of Sixty Years* (1909). *Sir Squire's Empty Chairs* (1925) is a volume of his reminiscences.

band (from Middle French *bande*, "troop"), in music, an ensemble of musicians playing chiefly woodwind, brass, and percussion instruments, in contradistinction to an orchestra, which contains stringed instruments. Apart

from this specific designation, the word band has wide vernacular application, from generalized usage (as in "dance band" and "jazz band") to the very specific (as in "harmonica band," "brass band," and "string band"). The term was first used in England to apply to the "king's band" of 24 violins at the court of Charles II (reigned 1660–85), a group modelled on Louis XIV's famous group of violins.

The wind, brass, and percussion ensemble that is called a band originated in 15th-century Germany, where ensembles consisting chiefly of oboes and bassoons formed part of the paraphernalia of military life. German musicians joined foreign groups, and wind bands spread eventually through France and England and to the New World. Toward the end of the 18th century, in the wake of the Turkish occupation of large parts of eastern Europe, a style of band music identified as Turkish, or Janissary, music (after the elite troops who, c. 1400–1826, guarded the Turkish sultans), became popular across the Continent. Its characteristically strident sound, produced in the original by shrill flutes and large drums, jangling triangles, cymbals, and Turkish crescents (jingling Johnnies), and its emphatic duple accent appealed to a growing taste for exoticism that led also to the employment of Negro drummers who marched brandishing their drumsticks in the manner of the later drum major. Janissary music inspired some of the greatest composers, including Haydn, in the second movement of his *Symphony No. 100 in G Major (The Military)*; Mozart, in the "Rondo alla Turca" movement of his *Piano Sonata in A Major* K. 331; and Beethoven, in the incidental music for *The Ruins of Athens*.

By the end of the 18th century, the number of wind instruments had increased greatly, primarily under the impact of the large-scale outdoor ceremonies of the French Revolution, which featured bands of as many as 2,000 musicians. Haydn's marches written for the Derbyshire yeomanry were scored for trumpet, two horns, two clarinets, two bassoons, and serpent (the wooden precursor of the tuba). In Berlin in 1838, 1,000 wind instruments and 200 drummers were assembled to perform in honour of the Russian emperor.

In England the brass band (sometimes called silver band, referring to the metal alloy of many instruments) began to replace the earlier bands of the town "waits" (public musicians) and of village churches at the end of the 18th century. The formation of such bands was encouraged by employers in industrial areas, and the development of the cornopean, a predecessor of the cornet, and of a family of brass instruments, with similar fingering, invented by the French instrument builder Adolphe Sax, facilitated the adoption of brass instruments by amateur players. Among the earliest of the English brass bands were the Stalybridge Old Band (1814) and the famous Besses o' the Barn (all-brass by 1853). Groups were formed to represent towns, factories, social clubs, and religious organizations such as the Salvation Army; contests, notably at Bell Vue, Manchester, and Alexandra Palace, London, culminated in 1900 in the National Brass Band Festival. Composers such as Sir Edward Elgar, Sir Arthur Sullivan, Gustav Holst, and Benjamin Britten contributed to the band literature. Such works were usually scored for cornets, flugelhorns, horns, B♭ baritones, euphoniums, and basses.

In the U.S., professional bands such as the celebrated band of Patrick Sarsfield Gilmore (1829–92) competed in attracting virtuoso soloists. Gilmore, whose musical skill was matched by a flair for showmanship, was particularly influential in promoting technical skill and repertory of high quality. His true successor was John Philip Sousa (1854–32), bandmaster of the U.S. Marine Band and composer of such marches as *Semper Fidelis*, *The Washington Post*, and *The Stars*

and *Stripes Forever*. The accomplishments of Gilmore and Sousa were to raise the art of the band to a distinguished level, making band music, in a sense, a very American musical genre. It remains a staple in parades and in the extravaganzas that form an important part of the entertainment incidental to sports events.

band, in cultural anthropology, theoretical type of human social organization consisting of a small number of nuclear families (usually no more than 30 to 50 persons in all) who are loosely organized for purposes of subsistence and security. They may also be integrated into a larger community, usually called a tribe (*q.v.*). Bands exist in sparsely populated areas and possess only primitive technologies, but there may be considerable variation in their habitats, as witness the desert-dwelling Australian Aborigines, the Pygmies of the Congo rain forests, and the Kaska Indians of the Yukon. Bands may occasionally coalesce for broader tribal ceremonies, hunting, or warfare.

band-pass filter, arrangement of electronic components that allows only those electric waves lying within a certain range, or band, of frequencies to pass and blocks all others. The components may be conventional coils and capacitors, or the arrangement may be made up of freely vibrating piezoelectric crystals (crystals that vibrate mechanically at their resonant frequency when excited by an applied voltage of the same frequency), in which case the device is called a crystal band-pass filter or a monolithic filter.

The crystal band-pass filter makes it possible to send a great number of simultaneous telephone conversations over a single long-distance line, microwave radio system, or submarine cable, because it separates each voice channel from all others. *See also* multiplexing.

band theory, in solid-state physics, theoretical model describing the states of electrons, in solid materials, that can have values of energy only within certain specific ranges. The behaviour of an electron in a solid (and hence its energy) is related to the behaviour of all other particles around it. This is in direct contrast to the behaviour of an electron in free space where it may have any specified energy. The ranges of allowed energies of electrons in a solid are called allowed bands. Certain ranges of energies between two such allowed bands are called forbidden bands—*i.e.*, electrons within the solid may not possess these energies. The band theory accounts for many of the electrical and thermal properties of solids and forms the basis of the technology of such devices as transistors, heating elements, and capacitors.

The band of energies permitted in a solid is related to the discrete allowed energies—the energy levels—of single, isolated atoms. When the atoms are brought together to form a solid, these discrete energy levels become perturbed interactions termed quantum mechanical effects, and the many electrons in the collection of individual atoms occupy a band of levels in the solid called the valence band. Empty states in each single atom also broaden into a band of levels that is normally empty, called the conduction band. Just as electrons at one energy level in an individual atom may transfer to another empty energy level, so electrons in the solid may transfer from one energy level in a given band to another in the same band or in another band, often crossing an intervening gap of forbidden energies. Studies of such changes of energy in solids interacting with photons of light, energetic electrons, X-rays, and the like confirm the general validity of the band theory and provide detailed information about allowed and forbidden energies.

A variety of ranges of allowed and forbidden bands are found in pure elements, alloys, and compounds. Three distinct groups are usually

described: metals, insulators, and semiconductors. In metals, forbidden bands do not occur in the energy range of the most energetic (outermost) electrons. Accordingly, metals are good conductors. Insulators have wide forbidden energy gaps that can be crossed only by an electron having an energy of several electron volts. Because electrons cannot move freely in the presence of an applied voltage, insulators are poor conductors. Semiconductors have relatively narrow forbidden gaps—which can be crossed by an electron having an energy of roughly one electron volt—and so are intermediate conductors.

Banda, a people of the Central African Republic, some of whom also live in Congo (Kinshasa) and Cameroon and possibly in The Sudan. The Banda speak a language of the Adamawa-Ubangi subgroup of the Niger-Congo language family that is related to that of their Gbaya and Ngbandi neighbours. The Banda are the largest single ethnic group in the Central African Republic, numbering about 1,300,000 in the early 21st century.

The Banda observe patrilineal descent and live in hamlets of dispersed homesteads under the local governance of a headman. Rural Banda raise corn (maize), cassava, peanuts (groundnuts), sweet potatoes, and tobacco. Men hunt and fish, and women gather wild foods and cultivate crops. Banda craftsmen produce carved wooden ritual and utilitarian objects; they are best known for their large slit drums carved in the shapes of animals.

Stateless when first encountered by Europeans, the Banda selected war chiefs only during times of crisis, after which the warriors were divested of their power. Age grades and initiations called *semali* assured intergroup unity in time of war. Marriage traditionally required bridewealth, often in iron implements. Polygamy, although still practiced, has declined with the rise of a money-based economy.

Bānda, city, southern Uttar Pradesh state, northern India, near the Ken River (a tributary of the Yamuna). An agricultural marketplace, Bānda lies at a road junction on a major rail line. The city's trade has been declining, and the road leading southward is no longer maintained. Bānda is noted for its agates from the Ken riverbed, which are exported. There are several mosques and Hindu temples, and outside the city are the ruins of an 18th-century fort, Kālinjar. The city and the fort changed hands repeatedly during struggles between the Muslims, Marāṭhās, French, and British. Pop. (2001) 134,839.

Banda, Hastings Kamuzu (b. c. 1898, near Kasungu, British Central Africa Protectorate [now Malaŵi]—d. Nov. 25, 1997, Johannesburg, S.Af.), first president of Malaŵi (formerly Nyasaland) and the principal leader of the Malaŵi nationalist movement. He ruled Malaŵi from 1963 to 1994, combining totalitarian political controls with conservative economic policies.

Banda, the son of a peasant, attended college in the United States, where he received a medical degree in 1927. He took another medical degree at the University of Edinburgh (1941) and practiced in London (1945–53).

He became involved in his homeland's politics when white settlers in the region demanded the federation of the Rhodesias and Nyasaland in 1949. Despite the strong objections of Banda and others in Nyasaland, the Federation of Rhodesia and Nyasaland was established in 1953. Banda practiced medicine in Ghana in 1953–58 but was under increasing pressure from Nyasa nationalists to return; he did so in 1958. As president of the Nyasaland African Congress, he toured the country making antifederation speeches and was held partly responsible by the British colonial government for increasing African resentment

and disturbances. He was imprisoned in 1959. Released in 1960, he soon accepted British constitutional proposals granting Africans in Nyasaland a majority in the Legislative Council. He was minister of natural resources and local government in 1961–63, becoming prime minister in 1963, the year the federation was dissolved. He retained the post of prime minister when Nyasaland achieved independence in 1964 as Malaŵi.

Shortly after independence, some members of Banda's governing cabinet resigned in protest against his autocratic methods and his accommodation with South Africa and the Portuguese colonies. In 1965 a rebellion broke out, led by two of these former ministers, but it failed to take hold. Malaŵi became a republic in 1966 with Banda as president. He headed an austere, autocratic one-party regime, maintained firm control over all aspects of the government, and jailed or executed his opponents. He was declared president for life in 1971. Banda concentrated on building up his country's infrastructure and increasing agricultural productivity. He established friendly trading relations with South Africa and other neighbours through which landlocked Malaŵi's overseas trade had to pass, and his foreign policy was decidedly pro-Western.

Widespread domestic protests and the withdrawal of Western financial aid forced Banda to legalize other political parties in 1993. He was voted out of office in the country's first multiparty presidential elections, held in 1994.

Banda Aceh, *kotamadya* (municipality), capital of Aceh semiautonomous province, Indonesia. It is located on the Aceh River at the northwestern tip of the island of Sumatra, facing the Andaman Sea.

Banda Aceh is known as the "doorway to Mecca," for historically it has been a stopping place for Muslim pilgrims journeying by ship from the east to Mecca. Visited by Marco Polo (1292) and by Ibn Baṭṭūṭah (1345–46), Banda Aceh became the capital of the sultanate of Aceh in the 17th century. Its ruler, Iskandar Muda, engaged in naval battles with the Portuguese in the Strait of Malacca. The Dutch occupied the city in 1873, and the subsequent Achinese War between the Dutch and the Achinese continued until 1903. Banda Aceh remained a centre of Achinese separatists after Aceh was incorporated into Indonesia. In 2004 a massive earthquake in the Indian Ocean west of Sumatra triggered a large tsunami that destroyed or heavily damaged much of the city and killed tens of thousands of people.

The population of Banda Aceh is mostly Achinese, together with South Asians, Arabs, Turks, Chinese, and others. Local industries produce gold jewelry, cotton and silk fabrics, lamps, engraved copper bowls, and sword blades. The city is linked by road and rail with the eastern coastal cities of Lhokseumane, Langsa, and Medan; it also has an airport. The city contains many notable sites—the Baturachman Mosque, the Aceh Museum, and the Gunongan, or Walking Palace (a series of baths and gardens on the riverbank)—however, most sustained heavy damage from the 2004 tsunami. Syiah Kuala University was founded in 1960. Pop. (2000) 154,767.

Banda Islands, island group, Maluku *provinsi* (province), Indonesia. They lie in the Banda Sea, southeast of Ambon Island and south of Ceram. The largest of the nine islands, which have a total land area of 17 square miles (44 square km), is Banda Besar, or Great Banda Island. An inland sea, formed by three of the group, provides an outstanding harbour; the coral gardens beneath the sea are virtually unrivaled. Banda Besar has coral rock to a height of 400 feet (120 m), with lava and basalt up to 1,758 feet (536 m). Mount Api, one of the island group, is an active volcano 2,200 feet (670 m) in elevation; it caused extensive destruction in 1820 and 1852.

The islands' volcanic soils are well adapted to the growth of nutmeg, which is indigenous. Other products are cloves, coconuts, tapioca, fish, and tropical fruits and vegetables. Half the population of the islands lives in Bandanaira, the capital and port city of Bandanaira Island. The inhabitants are mostly descendants of Javanese, Makasarese, and people from neighbouring islands brought in as labourers to work the Dutch nutmeg plantations.

The Banda Islands were annexed by the Portuguese in 1512, but early in the 17th century the Dutch expelled the Portuguese. England and the Netherlands then vied for the islands, which changed hands several times before they were restored to the Dutch in 1814.

Banda Sea, Bahasa Indonesia LAUT BANDA, portion of the western South Pacific, bounded by the southern islands of the Moluccas of Indonesia (Alor, Timor, Wetar, Babar, Tanimbar, and Kai on the south and Ceram, Buru, and Sula on the north). It occupies a total of 180,000 square miles (470,000 square km) and opens to the Flores (west), Savu (southwest), Timor (south), Arafura (southeast), and Ceram and Molucca (north) seas. The sea's North Banda Basin, plunging to a depth of 19,000 feet (5,800 m), is separated from the South Banda Basin by a submarine ridge that has coral islands surmounting its highest peaks. The South Banda Basin, descending to 17,700 feet (5,400 m), holds Mount Api, a volcano rising from 14,800 feet (4,500 m) below sea level to 2,200 feet (670 m) above. An arc of active volcanic islands stands on a second ridge dividing the South Banda Basin from Weber Basin, the deepest in the sea (24,409 feet [7,440 m]). Corals flourish in spectacular beauty in the clear waters around many islands.

Bandā Singh Bahādur, also called LACHMAN DĀS, LACHMAN DEV, or MADHO DĀS (b. 1670, Rājauri, India—d. June 1716, Delhi), first Sikh military leader to wage an offensive war against the Mughal rulers of India, thereby temporarily extending Sikh territory.

As a youth, he early decided to be a *samāna* (ascetic), and until 1708, when he became a disciple of Gurū Gobind Singh, he was known as Madho Dās. After his initiation into the Sikh brotherhood, he took the name Bandā Singh Bahādur and became a respected, if not popular, general; his cold and impersonal character did not endear him to his men.

Bandā Singh set out in 1709 to attack the Mughals, conquering large tracts of territory. His pillaging and massacring in the Deccan area led the Mughal rulers finally to move against him in force. After an eight-month siege, the fortress town of Gurdas Nangal fell to the Mughals in 1715. Bandā Singh and his men were taken as prisoners to Delhi, where every day for six months a few of his men were taken out and executed. When his own turn came, Bandā Singh stated to the Muslim judge that this fate befell him justly because he had failed his beloved Gurū Gobind Singh.

Bandama River, longest and, commercially, most important river in Côte d'Ivoire (Ivory Coast); with its major tributaries, the Red Bandama (Marahoué) and the Nzi, it drains half of the surface area of the country. It rises as the White Bandama in the northern highlands and flows southward for 497 miles (800 km) to enter the Gulf of Guinea and the Tagba Lagoon near Grand-Lahou. A hydroelectric plant at Kossou, just north of the confluence with the Marahoué, provides power for Côte d'Ivoire. Kossou is the site of the largest dam in the country and major agricultural fishery projects. Manganese and timber are shipped coastwise from the Tagba Lagoon and the river's lower section via the Asagny Canal to

Abidjan for export. The Bandama is navigable for about 35 miles (56 km) upstream from Grand-Lahou.

Bandar (India): *see* Masulipatam.

Bandar-e 'Abbās, port city on the Strait of Hormuz, the main maritime outlet for much of southern Iran. It lies on the northern shore of Hormuz Bay opposite the islands of Qeshm, Larak, and Hormuz. The inhabitants are mainly Arabs and African blacks. The summer climate is oppressively hot and humid, and many inhabitants move then to cooler places; however, winter is pleasant.

Bandar-e 'Abbās ("Port of 'Abbās") was established in 1623 by Shāh 'Abbās I to replace the city of Hormuz, which had been captured by the Portuguese in about 1514. During the 17th century it was the main port of Persia, but it lost this status in the 18th century to the rival port of Būshehr (Bandar-e Būshehr). From about 1793 Bandar-e 'Abbās was under lease to the rulers of Muscat, but in 1868 Iran canceled the contract and resumed direct control.

The port's imports consist mainly of manufactured goods; its exports include Kermān rugs, petroleum products, and agricultural produce. The town has a cotton mill, a fish cannery, and an oil refinery. The roadstead is shallow and badly sheltered. Despite the poor quality of its port facilities, the town boomed during the Iran-Iraq War of the 1980s when Iran's more westerly ports were threatened. A new harbour and shipbuilding yard were under construction in the late 20th century west of the existing port, and a major rail link was completed in 1995. Pop. (1996) 273,578.

Bandar-e Būshehr, also called BŪSHEHR, BUSHIR, BUSHIRE, or BŪSHAHR, port city, southwestern Iran. It lies near the head of the Persian Gulf at the northern end of a flat and narrow peninsula that is connected with the mainland by tidal marshes. Bandar-e Būshehr rose to prominence during the reign of Nāder Shāh when he established a naval base there in 1734 to control the periphery of the Persian Gulf. In the 1780s the English and Dutch East India companies transferred their trading posts to Būshehr from Bandar-e 'Abbās. Its commercial importance declined with the development by the Iranian government in the 1960s and '70s of Khorramshahr as the principal

Three-story house built in Persian Gulf style, Bandar-e Būshehr, Iran

Laurence D. Loeb

port for the Persian Gulf. Bandar-e Būshehr continues to serve as a port, though it is eclipsed by Bandar-e 'Abbās and Bandar-e Khomeynī (formerly Bandar-e Shāhpūr).

Bandar-e Būshehr has a deep but exposed outer anchorage and an inner one. It is connected by road to Bandar-e Khomeynī, Ban-

dar-e 'Abbās, and other cities; it is also linked to Tehrān by air and by road via Shīrāz and Eṣfahān. Bandar-e Būshehr is now a regional centre for oil distribution, has a degree-granting college, and is a fisheries centre. The establishment of a thermoelectric power plant there encouraged the growth of food-processing and engineering industries. Dried fruits, gums, rugs, and raw cotton are exported. The city suffered extensive damage in the Iran-Iraq War in the 1980s but was largely rebuilt in the 1990s. Pop. (1996) 143,641.

Bandar Lampung, formerly TANJUNG KARANG-TELUKBETUNG, port city, *kotamadya* (municipality), and capital of Lampung *provinsi* (province), Indonesia. It lies at the head of Lampung Bay on the south coast of Sumatra. Bandar Lampung was created in the 1980s from the amalgamation of the former provincial capital, Tanjungkarang, with the port of Telukbetung. The city's cottage industries include metalworking, handweaving, and pottery and tile-making. With air, road, and rail connections, Bandar Lampung is the chief port and transportation centre for the surrounding agricultural area, which produces rubber, tea, coffee, and pepper for export. Silver mining and cattle raising also contribute to the local economy. Pop. (1995 est.) 680,332.

Bandar Maharani (Malaysia): *see* Muar.

Bandar Seri Begawan, formerly (until 1970) BRUNEI TOWN, capital of Brunei. The city lies along the Brunei River near its mouth on Brunei Bay, an inlet of the South China Sea. It is an agricultural trade centre and river port. After suffering extensive damage during World War II, it was largely rebuilt; newer buildings include a royal palace, a sports stadium, and the Sultan Omar Ali Saifuddin Mosque, largest in the Far East. Bandar Seri Begawan lies on the main road running southwestward along Borneo's coast to Seria and Kuala Belait, and it is also served by a modern airport. The Brunei Museum is about 4 miles (6.5 km) away. Pop. (1991) city, 21,484; (1999 est.) urban area, 85,000.

Bandaranaike, S.W.R.D., in full SOLOMON WEST RIDGEWAY DIAS BANDARANAIKE (b. Jan. 8, 1899, Colombo, Ceylon [now Sri Lanka]—d. Sept. 26, 1959, Colombo), statesman and prime minister of Ceylon (1956–59),

S.W.R.D. Bandaranaike

Camera Press

whose election marked a significant change in the political history of modern Ceylon.

Educated at the University of Oxford, he was called to the bar in 1925. After returning to Ceylon, he entered politics and, in 1931, was elected to the newly formed legislative assembly, the State Council. In 1947, as a prominent member of the governing United National Party (UNP), he was elected to the new House of Representatives and appointed minister of health and local government. He resigned from the government and the Western-oriented UNP in 1951 and was re-elected in 1952 as the founder of the nationalist Sri Lanka

(Blessed Ceylon) Freedom Party, becoming leader of the opposition in the legislature. Four years later he formed the Mahajana Eksath Peramuna (MEP; People's United Front), a political alliance of four nationalist-socialist parties, which swept the election; he became prime minister on April 12, 1956.

The MEP advocated a neutralist foreign policy and strong nationalist policies at home. Sinhalese, the language spoken by the majority community, replaced English as the official language of the country, and Buddhism, the majority religion, was given a prominent place in the affairs of state. By amicable agreement the British relinquished their military bases on the island, and Ceylon established diplomatic relations with communist states.

A disgruntled Buddhist monk, Talduwe Somarama, shot Bandaranaike on Sept. 25, 1959, and he died the following day. After the 1960 elections, his widow, Sirimavo Ratwatte Dias Bandaranaike (*q.v.*), became prime minister.

Bandaranaike, Sirimavo Ratwatte Dias (b. April 17, 1916, Ratnapura, Ceylon [now Sri Lanka]—d. Oct. 10, 2000, Gampaha, Sri Lanka), stateswoman who, upon her party's victory in the 1960 Ceylon general election, became the world's first woman prime minister.

In 1940 she married S.W.R.D. Bandaranaike (*q.v.*). After her husband, who became prime minister in 1956, was assassinated in 1959, his Sri Lanka Freedom Party (SLFP) induced her to become the party's leader. The SLFP won

Sirimavo Bandaranaike, 1960

Keystone

the general election in July 1960, and she became prime minister.

She continued her husband's policies of socialism, neutrality in international relations, and support for Buddhism and the Sinhalese language and culture. In 1964 her coalition with the Marxist Lanka Sama Samaja Party caused dissension in her government, which was defeated in the general election of 1965. In 1970, however, her socialist coalition, the United Front, regained power, and as prime minister she pursued more radical policies including nationalizing industry. Her repressive measures and failure to deal with ethnic rivalries and economic distress led to her defeat in the election of July 1977.

In 1980 the parliament stripped her of her political rights and barred her from political office, but her rights were restored in 1986. She lost a bid for the presidency in 1988, but her daughter, Chandrika Kumaratunga, who succeeded her as head of the SLFP, won the office in 1994 and appointed her mother prime minister. Bandaranaike resigned in August 2000 due to ill health and died shortly thereafter.

banded anteater (marsupial mammal): *see* numbat.

banded-iron formation (BIF), chemically precipitated sediment, typically thin bedded or laminated, consisting of 15 percent or more

iron of sedimentary origin and layers of chert, chalcedony, jasper, or quartz. Such formations occur on all the continents and usually are older than 1.7 billion years. They also are highly metamorphosed. Most BIFs contain iron oxides—hematite with secondary magnetite, goethite, and limonite—and are commonly used as low-grade iron ore (e.g., as in the Lake Superior region of North America). Because BIFs apparently have not formed since Precambrian time, special conditions are thought to have existed at the time of their formation. Considerable controversy exists over BIF origin, and a number of theories have been proposed. Their formation has been variously ascribed to volcanic activity; rhythmic deposition from iron and silica solutions due to seasonal variations; oxidation of iron-rich sediments contemporaneous with deposition; and precipitation from solution as a result of special oxidation-reduction conditions.

bandeira, Portuguese slave-hunting expedition into the Brazilian interior in the 17th century. The *bandeirantes* (members of such expeditions) were usually mamelucos (of mixed Indian and Portuguese ancestry) from São Paulo who went in search of profit and adventure as they penetrated into unmapped regions. They thus helped establish Brazil's claim to the South American interior, beyond the line between Portuguese and Spanish possessions in the Americas that had been laid down in the Treaty of Tordesillas (1494).

The *bandeiras*, numbering anywhere from about 50 to several thousand men, were organized and tightly controlled by wealthy entrepreneurs. The expeditions would usually found settlements en route, build roads, and lay the basis for agriculture and ranching in the interior. They would often ally themselves with one Indian tribe against another and end by enslaving both weakened belligerents. The mission villages established by the Jesuits for the Indians were prime targets for *bandeira* slave raids. The first *bandeira*, organized by Antonio Raposo Tavares in 1628, raided 21 such villages in the upper Paraná valley and captured about 2,500 Indians. The Jesuit missionaries were the chief opponents of the *bandeirantes* and tried to stave off their attacks by moving their villages farther south and west and by arming the mission Indians. Nevertheless, the *bandeiras*, the most famous of which was led by Fernão Dias Pais Leme, netted large profits in slaves and wreaked great injury on the Indians.

Bandeira, Manuel, in full MANUEL CARNEIRO DE SOUSA BANDEIRA FILHO (b. April 19, 1886, Recife, Brazil—d. Oct. 13, 1968, Rio de Janeiro), poet who was perhaps the principal figure in the Brazilian literary movement known as Modernismo.

In his poetry, Bandeira used colloquial Brazilian speech to treat prosaic themes and everyday events with directness and humour. His first two books of verse, *A Cinza das Horas* (1917; "Ashes of the Hours") and *Carnaval* (1919; "Carnival"), show the influence of late Symbolist and Parnassian poetry, but some of the poems in his next collection, *O Ritmo Dissoluto* (1924; "Dissolute Rhythm"), display the sensibility of the emerging Modernist movement, which was attempting to liberate South American poetry from academicism and European influence. Bandeira's next collection, *Libertinagem* (1930; "Libertinism"), clearly displays the transition to Modernism in its use of free verse, colloquial language, unconventional syntax, and themes based on Brazilian folklore. Bandeira's subsequent books, *Estrêla da Manhã* (1936; "Morning Star"), *Estrêla da tarde* (1963; "Evening Star"), and *Estrêla da vida inteira* (1965; "Whole Life Star"), consolidated his reputation as a leading Brazilian poet.

Bandeira taught literature at the College of Pedro II in Rio de Janeiro from 1938 to 1943

and became a professor at the University of Brazil in the latter year. In addition to writing poetry, he was also a translator, critic, anthologist, and literary historian. His reputation as a poet diminished somewhat after his death.

Bandelier, Adolph (b. Aug. 6, 1840, Bern, Switz.—d. March 18, 1914, Seville, Spain), Swiss-American anthropologist, historian, and archaeologist who was among the first to study

Bandelier
By courtesy of the Southwest Museum, Los Angeles

the American Indian cultures of the southwestern United States, Mexico, and Peru-Bolivia. His works, particularly those relating to the Southwest and Peru-Bolivia, are still of considerable value.

Bandelier undertook archaeological, ethnographic, and documentary studies in the Southwest and Mexico. Works resulting from these efforts included *Final Report of Investigations Among the Indians of the Southwestern United States . . .* (1890–92) and a fictionalized Pueblo ethnography, *The Delight Makers* (1890). The most important work based on his studies in Peru and Bolivia (1892–1903) was *The Islands of Titicaca and Koati* (1910). Following his return to the United States, he held museum and teaching posts in New York City and Washington, D.C., before departing for Spain (1913) to continue documentary investigations on the Pueblo Indians.

Bandelier National Monument, scenic wilderness and archaeological area of the Pajarito Plateau, in north-central New Mexico, U.S. It lies along the Rio Grande, 20 miles (32 km) west-northwest of Santa Fe. Established in 1916, it occupies an area of 51 square miles (132 square km) and was named for Adolph Bandelier, the Swiss-American archaeologist. The monument contains many cliff and open-pueblo ruins, notably Tyuonyi and Tsankawi, of pre-Columbian Indians (mostly 13th-century) in Frijoles Canyon. Kivas (ceremonial chambers), stone sculptures and man-made caves have also been unearthed.

Bandello, Matteo (b. 1485, Castelnuovo Scrivia, duchy of Milan [Italy]—d. 1561, Agen, France), Italian writer whose *Novelle* (stories) started a new trend in 16th-century narrative literature and had a wide influence in England, France, and Spain.

A monk, diplomat, and soldier as well as a writer, Bandello was educated at Milan and the University of Pavia. He frequented the courts of Ferrara and Mantua and knew Niccolò Machiavelli. He was entrusted with the education of Lucrezia Gonzaga, to whom he dedicated a long poem. After the material for his *Novelle* was destroyed in the Spanish attack on Milan (1522), he fled to France. In 1550 he was made bishop of Agen and spent the remainder of his life in France writing the stories on which his reputation rests.

Bandello's *Novelle* were published over the years 1554–73 in four volumes that contain a total of 214 short stories, or tales. These are frequently daring or sensual in the manner of Giovanni Boccaccio's *Decameron* and provide valuable insights into the social intrigues of Renaissance Italy. The stories are rich in dramatic and romantic elements, though Ban-

dello, unlike his contemporaries, did not aim at classical dignity in his narrative style.

Bandello's stories were translated into both French and English in the 1560s and '70s, with the English translators adding a severe moral tone to the tales. The stories provided the themes for several important Elizabethan plays, notably William Shakespeare's *Romeo and Juliet* (1596), *Much Ado About Nothing* (1598), and *Twelfth Night* (1600), and John Webster's *The Duchess of Malfi* (published 1623). Bandello's influence can also be discerned in French and Spanish literature.

bandeng: see milkfish.

bāndhani work, Indian tie dyeing, or knot dyeing, in which parts of a silk or cotton cloth are tied tightly with wax thread before the whole cloth is dipped in a dye vat; the threads are afterward untied, the parts so protected being left uncoloured. The technique is used in many parts of India, but Gujarāt and Rājasthān produced, and are still noted

Detail of a *bāndhani*-work sari from Gujarāt, 19th century; in the Prince of Wales Museum of Western India, Bombay

P. Chandra

for, the finest work. Surviving examples of the technique do not predate the 18th century, making it difficult to trace its earlier history.

The process is fairly laborious and largely confined to young working girls, who grow long fingernails with which they deftly handle the fabric. It consists of folding, tying, and dyeing the cloth in several stages; the final result is a fabric with a red or blue field patterned with white and yellow dots. Geometrical ornament is most popular, but animal and human figures and flowers are also introduced in elaborate examples.

bandicoot, any of about 22 species of Australasian marsupial mammals comprising the

Bandicoot (*Perameles nasuta*)
Warren Garst—Tom Stack and Associates

family Peramelidae. (For Asian rodents of this name, see bandicoot rat.) Bandicoots are 30 to 80 cm (12 to 31 inches) long, including the 10- to 30-centimetre (4- to 12-inch) sparsely haired tail. The body is stout and coarse haired, the muzzle tapered, and the hind limbs longer than the front. The toes are reduced in number; two of the hind digits are united. The teeth are sharp and slender. The pouch opens rearward and encloses 6 to 10 teats. Unlike other marsupials, bandicoots have a placenta (lacking villi, however). Most species have two to six young at a time; gestation takes 12–15 days.

Bandicoots occur in Australia, Tasmania, New Guinea, and nearby islands. They are terrestrial, largely nocturnal, solitary animals that dig funnellike pits in their search for insect and plant food. Farmers consider them pests; some species are endangered, and all have declined.

The long-nosed bandicoot (*Perameles*, or *Thylacis nasuta*), a vaguely ratlike brown animal whose rump may be black-barred, is the common form in eastern Australia. The three species of short-nosed bandicoots, *Isoodon* (incorrectly *Thylacis*), are found in New Guinea, Australia, and Tasmania. Rabbit-eared bandicoots, or bilbies, are species of *Thylacomys* (sometimes *Macrotis*); now endangered, they are found only in remote colonies in arid interior Australia. As the name implies, they have big narrow ears, long hind legs, and bushy tails. The 35-centimetre- (14-inch-) long, pig-footed bandicoot (*Chaeropus ecaudatus*) of interior Australia has feet that are almost hooflike, with two toes functional on the forefoot, one on the hind foot. This herbivorous creature, resembling a little deer, is an endangered species and may well be extinct; it was last observed locally in the 1920s.

bandicoot rat (species *Bandicota indica*), large, blackish brown burrowing rat belonging to the family Muridae (order Rodentia), of

Bandicoot rat (*Bandicota indica*)
Painting by Don Meighan

India and Sri Lanka; sometimes called mole rat. The bandicoot rat has a short head, broad muzzle, and a scaly, almost hairless tail. It weighs 0.5 to 1.4 kg (1 to 3 pounds) and is 20 to 38 cm (8 to 15 inches) long, with the tail an additional 15 to 30 cm (6 to 12 inches). An inhabitant of forest, cultivated land, villages, and towns, the bandicoot rat is destructive to crops, grain, and poultry. Litter size is probably large, since the female has 12 teats. An allied species, called the pest rat, short-tailed bandicoot, or mole rat (*Nesokia indica*), inhabits southwestern Asia. A large, burrowing rodent, it also is destructive to crops.

The bandicoot rat is said to grunt like a pig, and a Telugu name *pandi-koku* (meaning "pig-rat") has been corrupted into "bandicoot." The name has since been applied to a family (Peramelidae) of Australian marsupials.

Bandiera, Attilio; and Bandiera, Emilio (respectively b. May 24, 1810, Venice [Italy]—

d. July 23, 1844, Cosenza, Kingdom of Naples; b. June 20, 1819, Venice—d. July 23, 1844, Cosenza), followers of Giuseppe Mazzini who led an abortive revolt against Austrian rule in

Attilio Bandiera, oil painting by Molmenti Pompeo, c. 1840; in the Museo del Risorgimento, Venice
By courtesy of the Civici Musei, Venice

Italy and whose execution made a profound impression on the Italian revolutionary movement.

The sons of Baron Francesco Bandiera, an admiral in the Austrian navy, Attilio and Emilio themselves became naval officers but were converted to the cause of Italian independence by Mazzini, carrying on correspondence with him and with members of his organization, Giovine Italia (Young Italy). In 1841, while serving in the war with Syria under their father's command, they founded a secret society, *Esperia*, devoted to the cause of freeing Italy. In 1843 they began to agitate among their fellow officers and sailors, trying to get them to join a Malta-based revolutionary group, the *Legione Italiana*, in its plan for stealing a warship and bombarding Messina. The plot was betrayed by a member of *Esperia*, and in 1844 the brothers were forced to flee to the island of Corfu off the coast of Greece.

Hearing that the people of the Kingdom of Naples were awaiting only the appearance of a leader to rise en masse, the Bandieras gathered a band of about 20 young men and set sail for Calabria (the toe of Italy) on June 12, 1844. Landing at Cotrone four days later, they intended to march on nearby Cosenza, liberating political prisoners and issuing a proclamation of independence. Their expected support did not materialize, and they were betrayed by a Corsican member of their party, Pietro

Emilio Bandiera, oil painting by Molmenti Pompeo, c. 1840; in the Museo del Risorgimento, Venice
By courtesy of the Civici Musei, Venice

Boccheciampè. The whole band was taken prisoner by a detachment of gendarmes and were taken to Cosenza, where most of them were tried and condemned to death. On July 23, 1844, the Bandieras and nine companions were executed, crying "Viva l'Italia!" as they fell.

The execution of the Bandieras made them martyrs for the cause of Italian independence. The execution also had wide repercussions ex-

tending to England. Mazzini proved that his correspondence with the Bandieras had been systematically opened on the orders of the British home secretary, Sir James Graham. He charged the British Foreign Office with having forwarded their plans to the Austrians. That accusation was later disproved, but it gave Mazzini the opportunity of making an eloquent plea for his cause in a famous "Letter to Sir James Graham."

Bandinelli, Baccio (b. Nov. 12, 1493?, Florence [Italy]—d. Feb. 7, 1560, Florence), Florentine Mannerist sculptor whose Michelangelo-influenced works were favoured by the Medici in the second quarter of the 16th century.

Bandinelli was trained as a goldsmith by his father, Michele di Viviano de' Brandini, who was patronized by the Medici family. Showing marked predilection for sculpture, he worked under the sculptor Giovanni Francesco Rustici and became one of the principal artists at the court of Cosimo I de' Medici, grand duke of Tuscany. He founded an academy for artists in the Vatican (1531) and one in Florence (c. 1550). Accounts of Bandinelli given in Giorgio Vasari's *Lives* and in the *Autobiography* of Benvenuto Cellini represent him as jealous, malignant, and untalented. He assumed the surname Bandinelli in 1530.

Bandinelli's surviving works prove him to have been a more distinguished sculptor than

"Self-Portrait," oil on panel by Baccio Bandinelli, 1529–30; in the Isabella Stewart Gardner Museum, Boston

By courtesy of the Isabella Stewart Gardner Museum, Boston

his contemporaries allowed. His copy of the Laocoön (Uffizi, Florence), his statue of Hercules and Cacus (1534; Piazza della Signoria), and his reliefs on the choir screen of Florence Cathedral explain the vogue that his austere, rather arid work enjoyed at the Medici court. In later life he was supplanted in favour by the sculptors Benvenuto Cellini and Bartolommeo Ammannati. Shortly before his death Bandinelli and his son Clemente sculpted his own tomb (1554; Santissima Annunziata, Florence), noted for its group of "Lamentation over the Dead Christ."

Bandinelli, Rolando: see Alexander III under Alexander (papacy).

Bandırma, formerly PANDERMA, ancient PANORMOS, port and town, northwestern Turkey, on the Sea of Marmara. It was used in the 13th century by the Latin crusaders as a base of operation against the Greeks of Asia Minor and was taken by the Ottomans in the next century. Its protected harbour is now an active transit port between Istanbul and İzmir. A commercial centre, it exports the varied products of the hinterland, including cereals, sheep and cattle, grain, and boracite.

Bandırma has road and rail connections with İzmir, Ankara, and Balıkesir. Lake Manyas, to the south, is a bird sanctuary and national park. Pop. (2000) 97,419.

bandola (musical instrument): *see* bandurria.

Bandon, Irish DROICHEAD NA BANDAN, town, County Cork, Ireland, 17 miles (27 km) southwest of Cork. Founded in 1608 by Richard Boyle, later Earl of Cork, Bandon was initially populated by English and Scottish settlers. Parts of the original town wall remain; the ruins of a 15th-century castle are nearby. Kilbrogan Church (1610), the first Protestant church built in Ireland, contains the town stocks. Bandon lies in the broad valley of the River Bandon, which has good salmon and trout fishing; it is an agricultural centre with distilleries, light engineering industries, breweries, and flour mills. Pop. (2002) 1,578.

Bandon, River, river in County Cork, Ireland, flowing in a valley cut in rocks of the Carboniferous period (about 300 million years ago) but covered with glacial drift and alluvium. The river rises in the Maughanaclea Hills in western Cork and flows east to a point west of Caha Bridge where it turns south, before turning east again to the southeast of Dunmanway. It then flows in a broad fertile valley, with woodlands, to Bandon, and loops in an arc past Inishannon, where it flows southeast and then east, becoming an estuary reaching the sea in Kinsale Harbour, a distance of about 40 miles (64 km). The Bandon Estuary in the vicinity of the town of Kinsale is an important resort and fishing area.

Bandula, Maha, also spelled MAHABANDULA (b. 1780?—d. April 1, 1825, Danubyu, Myanmar [Burma]), Myanmar general who fought against the British in the First Anglo-Burmese War (1824–26).

In 1819 Maha Bandula served in the Myanmar army occupying Manipur, and two years later he commanded a second Myanmar force in the conquest of Assam. King Bagyidaw subsequently appointed him governor of Assam and minister at the court of Ava. In January 1824, because of increased tensions along the Bengal-Arakan border, he was sent with 6,000 troops to Arakan. When the British declared war in March, he immediately invaded Bengal, occupying Ratnapallang and defeating a British force at Ramu. His objective was to seize Chittagong and Dacca in a lightning thrust and, with the aid of a second Myanmar army marching from Assam, to expel the British from Bengal. His plan was frustrated, however, when the British landed a force at Yangôn (Rangoon) in May. The opening of a second front obliged him to call off the campaign and make a difficult retreat over the Arakan Yoma to Ava.

After raising a large army in northern Myanmar, Maha Bandula marched to Danubyu, on the Irrawaddy River, where he established his headquarters in October 1824. In December he attempted, unsuccessfully, to encircle the British, who were entrenched in the neighbourhood of Yangôn. When his headquarters fell to the British, he retreated to prepare for the defense of Danubyu.

In March 1825 the British attacked Danubyu, which Bandula defended courageously. After he was killed in battle, resistance collapsed, Danubyu fell, and the British advanced to Prome, signaling defeat for the Myanmar.

Bandundu, formerly (until 1966) BANNINGVILLE, city, southwestern Congo (Kinshasa), at the junction of the Kwango and Kwilu rivers. It is a river port serving navigation on the Congo River system from Kinshasa (the national capital, 186 miles [300 km] southwest). There are air links to Kinshasa

and such eastern centres as Kikwit and Kananga. The locality is mainly agricultural, producing palm oil and kernels, peanuts (groundnuts), manioc, and fibrous plants (for rope making). Pop. (latest est.) 64,000.

Bandung, also spelled BANDOENG, *kotamadya* (municipality) and capital of Jawa Barat *provinsi* (province), Indonesia, in the interior of Java on the northern edge of a plateau nearly 2,400 feet (730 m) above sea level. The city, founded in 1810 by the Dutch, has a mild and pleasant climate. Beautiful scenery surrounds the city, with rice fields, waterfalls, and heights rising to nearly 7,050 feet (2,150 m). Bandung is a modern city, with wide, tree-lined streets and many buildings and residences built in Western style. Notable public buildings include the Merdeka and the Dwipurna, site of the 1955 Bandung Conference of African and Asian nations, which took a strong stance against Western colonialism. Taman Sari, or Jubilee Park, is the finest of three large parks.

Bandung is the centre of Sundanese cultural life. The Sundanese, who compose the largest segment of Jawa Barat's population, differ significantly in customs and language from their Javanese neighbours to the east. In Bandung, Sundanese literature, dance, song, and theatre are preserved, studied, and renewed.

The city's prestigious Bandung Institute of Technology, which originated in 1920 as a college of architecture and engineering in the Dutch period, today represents the faculties of mathematics and of the natural and applied sciences of the University of Indonesia in Jakarta. Among the other institutions of higher education in Bandung are the private Islam Nisantara University (1959) and the Katolik Parahyangan University (1955). There are

The administration building of the Bandung Institute of Technology, Java, Indonesia; the Minangkabau roofs are typical of the local architecture
C. May—Shostal/EB Inc.

academies for plastic arts, physical education, and military affairs; a nuclear research centre; and a geological museum. The Observatorium Bosscha is in the Lembang highlands, to the north. A large area is devoted to the experimental cultivation of vegetables and flowers.

The chief industry is textile manufacturing; other manufactures are quinine, rubber goods, and machinery. Industrial institutes conduct research on yarns, dyes, chemicals, and ceramic raw materials. Communications include a railway line, an airport, and a powerful radio station. Pop. (2000) 2,136,260.

Bandung Conference, a meeting of Asian and African states, organized by Indonesia, Myanmar (Burma), Ceylon (Sri Lanka), India, and Pakistan, which met April 18–24, 1955, in Bandung, Indon. In all, 29 countries representing more than half the world's population sent delegates.

The conference reflected the five sponsors' dissatisfaction with what they regarded as a reluctance by the Western powers to consult with them on decisions affecting Asia; their concern over tension between the People's Republic of China and the United States; their desire to lay firmer foundations for China's peaceful relations with themselves and the

West; their opposition to colonialism, especially French influence in North Africa; and Indonesia's desire to promote its case in the dispute with The Netherlands over the western portion of New Guinea.

Major debate centred upon the question of whether Soviet policies in eastern Europe and central Asia should be censured along with Western colonialism. A consensus was reached in which "colonialism in all of its manifestations" was condemned, implicitly censuring the Soviet Union, as well as the West. The Chinese prime minister, Zhou Enlai, displayed a moderate and conciliatory attitude that tended to quiet fears of some anticommunist delegates concerning China's intentions. A 10-point "declaration on the promotion of world peace and cooperation," incorporating the principles of the United Nations charter and the five principles of India's prime minister Jawaharlal Nehru, was adopted unanimously.

During the following decade, as decolonization progressed and friction among the conference's members increased, the concept of Asian-African solidarity became less and less meaningful. Major schisms among the sponsors of the original conference emerged in 1961 and again in 1964–65, when China and Indonesia pressed for a second Asian-African conference. In both instances India, together with Yugoslavia and the United Arab Republic (Egypt), succeeded in organizing rival conferences of nonaligned states that refused to take the strong anti-Western positions urged by China and, in 1964–65, by Indonesia. In November 1965 the second Asian-African conference (to have been held in Algiers, Alg.) was indefinitely postponed, and it long appeared unlikely that the Bandung Conference would ever have a successor.

In 2005, on the 50th anniversary of the original conference, leaders from Asian and African countries met in Jakarta and Bandung to launch the New Asian-African Strategic Partnership (NAASP). They pledged to promote political, economic, and cultural cooperation between the two continents.

bandurria, also called BANDO, short-necked, pear-shaped, flat-backed stringed musical instrument of the lute family, native to Spain, where it is often used in outdoor music. Mentioned in the 14th century as the *mandurria* (the name it still bears in the Balearic

Bandurria by Hijos de González, Madrid, 1892; in the Smithsonian Institution, Washington, D.C.

By courtesy of the Smithsonian Institution, Washington, D.C.

Islands), it was originally both fretted and unfretted, with three to five strings.

The modern bandurria has six paired courses of gut and metal-spun silk strings that are

tuned g♯-c♯-f♯-b'-e''-a'' (beginning with the G♯ below middle C) and hitched to a guitar-like (tension) bridge. There are 12 fixed metal frets on the fingerboard, and the instrument is played with a short, hard plectrum. The regular tuning in fourths throughout gives great facility and uniformity of fingering in chromatic passages.

bandwidth, in electronics, the range of frequencies occupied by a modulated radio-frequency signal, usually given in hertz (cycles per second) or as a percentage of the radio frequency. For example, an AM (amplitude modulation) broadcasting station operating at 1,000,000 hertz has a bandwidth of 10,000 hertz, or 1 percent (10,000/1,000,000). The term also designates the frequency range that an electronic device, such as an amplifier or filter, will transmit.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

bandy, also called **BANTY**, a game similar to ice hockey. It is played almost exclusively in the Scandinavian countries, the Baltic countries, and Mongolia. A team is composed of from 8 to 11 players who wear skates and use curved sticks to hit a ball. Rink size varies but is characteristically larger than an ice hockey rink (about 100 by 55 m [109 by 60 yards]). The goalie does not use a stick but, alone among the players, can touch the ball with his hands. There are two halves of 45 minutes each, and play commences at the centre circle. Unlike hockey, no play is allowed behind the goals. Play begins with a "stroke off," and each team is confined to its own half of the rink. The use of a ball instead of a flat puck makes bandy faster than hockey. Free strokes are given for penalties, such as for going over the midline. Free substitution is permitted. There are six officials in the game. Bandy originated in England in the late 18th century, and the modern game of ice hockey probably developed from it.

bandy-bandy (species *Vermicella annulata*), Australian snake of the cobra family Elapidae, strikingly ringed with black and white or yellow. It is about 76 cm (30 inches) long and is venomous but inoffensive. Five species are recognized.

Bandy-bandy (*Vermicella annulata*)
Painting by David M. Dennis

It has a small head and eyes and a slender, cylindrical body. To frighten off enemies the bandy-bandy raises a few coils of its body vertically, presenting an unusual silhouette.

baneberry, also called **COHOSH**, or **NECKLACE-WEED**, any of about eight species of perennial herbaceous plants constituting the genus *Actaea* of the buttercup family (Ranunculaceae); they are all native to North Temperate Zone woodlands.

The white baneberry (*A. pachypoda*; sometimes *A. alba*), which is native to North America, is 30 to 45 cm (12 to 18 inches) tall and bears white berries. The cohosh, or herb Christopher (*A. spicata*), native to Eurasia, is approximately 30 to 60 cm (12 to 24 inches) tall and bears purplish black berries

White baneberry (*Actaea pachypoda*) showing (top) leaves and flowers, (bottom) fruit
(Top) Peter K. Nelson, (bottom) Nelson Groffman

that sometimes are used to make dye. The red baneberry, or red cohosh (*A. rubra*), native to North America, closely resembles *A. spicata*. Its fruits are red or ivory. The roots and berries of baneberry plants contain irritant resins that have a cathartic action and produce vomiting.

The plants are useful subjects for the shady wild garden.

Banér, Johan (b. July 3 [June 23, Old Style], 1596, Djursholm Castle, Sweden—d. May 20 [May 10], 1641, Halberstadt, Magdeburg [Germany]), Swedish field marshal who was one of the foremost soldiers in the Thirty Years' War.

His father, Gustaf Banér, a member of the King's Council, was executed in 1600 after Charles IX's defeat of Sigismund III of Poland in their struggle for the Swedish throne. Entering the Swedish army in 1615, Johan Banér was greatly influenced by the military ideas of the young king Gustavus Adolphus; he served with distinction in Russia, Livonia, Poland, and Germany and early attained the rank

of general. In 1634 he was appointed field marshal, with command of an army corps in Silesia and Bohemia; and, after the main Swedish army had been crushed at the Battle of Nördlingen that year, he was asked to take command of all Swedish forces in Germany.

In 1636 his great victory over Saxon and imperial forces at the Battle of Wittstock restored both Sweden's morale and (for a time) its paramount influence in central Germany. In 1637, hard pressed by the enemy's armies and almost surrounded, he made a strategic retreat into northern Germany that provoked the contemporary comment that "the enemy had put him in the sack but had forgotten to tie it." By the end of 1638, however, Banér had collected reinforcements, with which he began a new offensive toward central and southern Germany. At Chemnitz (April 1639), he defeated the imperial forces. Reinforced by French troops, he advanced toward southern Germany during the summer and autumn of 1640 but could not force the enemy to a battle. After a dangerous march through Bohemia in the winter, he died at Halberstadt of a pulmonary disease contracted during the winter campaign.

Banerjea, Sir Surendranath (b. Nov. 10, 1848, Calcutta, India—d. Aug. 6, 1925, Barrackpore, near Calcutta), one of the founders of modern India and proponent of autonomy within the British Commonwealth.

Banerjea was born into a distinguished family of Brahmans. After graduation from college, he applied in England for admission to the Indian Civil Service, which at that time had only one Hindu. Banerjea was rejected on the grounds that he had misrepresented his age. Charging racial discrimination, he won his appeal by arguing that he calculated his age according to the Hindu custom of reckoning age from the date of conception rather than from birth. He was appointed to Sylhet (now in Bangladesh) but was dismissed in 1874, in the midst of controversy and protests, following charges of procedural irregularities.

In a teaching career for the next 37 years, Banerjea founded Ripon College (Calcutta), later renamed after him, and developed his ideas on nationalism. In 1876 he helped found the Indian Association to bring Hindus and Muslims together for political action; three years later he purchased *The Bengalee*, a newspaper he edited for 40 years from his nationalist viewpoint.

An effective speaker at the annual sessions of the Indian National Congress, which first met in 1885, he was twice elected its president in the years before the moderate-extremist split of 1917.

In London in 1909 Banerjea appealed to the British to modify the partition of Bengal, reinstate habeas corpus, and grant India a constitution on the Canadian model. He believed firmly in representative government and constitutional progress by constitutional means. He advised Indians to "agitate, agitate, agitate—you have yet to learn the great art of grumbling," but he opposed the extreme methods advocated by the political leader B.G. Tilak and some of the noncooperation tactics that were practiced by Mahatma Gandhi.

Elected in 1913 to both the Bengal and imperial legislative councils, Banerjea welcomed the principles of the Montagu-Chelmsford report of 1918, which recognized self-government as the goal of British policy in India. In 1921 he was knighted and accepted office as minister of local self-government in Bengal. Attacked by extreme nationalists as a turncoat, he was defeated in the 1924 dyarchy elections by a Swaraj (independence) candidate, whereupon he retired to write his autobiography, *A Nation in Making* (1925).

Banff, town, southwestern Alberta, Canada. Banff lies along the glacial-green Bow River, near the scenic Lake Louise and the

British Columbia border; it is the headquarters of Banff National Park. Named by Lord Strathcona for the Scottish royal burgh of Banff, the settlement developed as a resort after the arrival (1883) of the Canadian Pacific Railway and the establishment (1885) of

Ranges of the Rocky Mountains, which are locally composed of limestone and shale and have a toothlike appearance. Banff contains active glaciers, and its valleys include montane wetlands and meadows. Trees of the montane region include lodgepole pine, aspen, and, less

Banff National Park. Situated along the Trans-Canada Highway, it is a year-round tourist and convention centre, with hot sulfur springs, skiing facilities, a school of fine arts, a museum, and a sanitarium. Indian Days celebration (August) and a winter-sports carnival are annual events. Banff's light manufactures include pharmaceuticals, and coal is mined locally. Pop. (1996) 6,098.

Banff, ancient royal burgh (town), Aberdeenshire council area, historic county of Banffshire, northeastern Scotland. It is a North Sea port and lies on the west bank of the River Deveron opposite its sister town, Macduff, to which it is connected by a bridge (1799).

By the 12th century Banff was a thriving member of a league of Scottish ports. Its castle (the remains of which still exist), built originally as a defense against Viking raids, was then a royal residence and the town a royal burgh, whose charters date from 1163, 1324, and 1372 (still extant). Duff House, the town's architectural showpiece, was designed by William Adam (c. 1735) and presented to the burgh in 1906. Local industries include fishing, brewing, distilling, food processing, and tourism. Banff is the historic county town (seat) of Banffshire. Pop. (1991) 4,110.

Banff and Buchan, former district (1975–96) of northeastern Scotland, now included in the council area of Aberdeenshire.

Banff National Park, national park in southwestern Alberta, Canada. Located on the eastern slopes of the Rocky Mountains, Banff occupies 2,564 square miles (6,641 square km). It is adjacent to Yoho and Kootenay national parks and south of Jasper National Park. Noted for its beauty, plant and animal diversity, and ongoing geologic processes, Banff was designated part of the Canadian Rocky Mountain Parks World Heritage site in 1984.

In 1883 a cluster of natural hot springs was discovered above the Bow River valley, a narrow montane ecoregion that runs through the heart of what is now Banff. In 1885 an area of 10 square miles (24 square km) around the springs was declared a natural reserve. Two years later, the region became Canada's first national park. In 1930 the park was extended and given its present name.

Banff's landscape makes up part of the Front

commonly, black spruce. Englemann spruce and limber pine grow in the subalpine region, and hardier vegetation, such as the low-growing willow, grow the alpine zone. The park is home to the grizzly and black bear, wapiti (elk), moose, mule deer, wolf, caribou, mountain goat, marmot, and an abundant bird population. Banff's Vermillion Lakes is an archaeological site with some of Canada's earliest known human remains, dating to 10,500 years ago.

With more than 4 million visitors each year, Banff is Canada's most popular national park. It has numerous campgrounds and trailer sites, and there are many hotels nearby. Ecologists have warned, however, that this human presence is having an adverse effect on habitats, wildlife, and water quality.

Banffshire, also called BANFF, historic county, northeastern Scotland, extending from the Grampian Mountains to the North Sea. The northeastern portion of the county, including the historic county town (seat) of Banff, is part of the council area of Aberdeenshire, while the remainder of the county lies within the council area of Moray (q.v.).

The Picts (q.v.), who possessed the land of Banffshire in Roman times, left few remains other than cairns (heaped stones), though the word occurs in many place-names. Remnants of what is believed to have been a Roman camp may still be made out in Glenbarry. A sculptured stone at Mortlach is said to commemorate a signal victory gained by King Malcolm II over the Norsemen in 1010. The shire was also the scene of much strife after the Reformation. The Industrial Revolution of the 18th and 19th centuries made little impact on the mostly agricultural county, but the scenic coast, glens (valleys), and hills of Banffshire spurred the development of a tourism industry during the 19th and 20th centuries.

Bang, Bernhard Lauritz Frederik (b. June 7, 1848, Sorø, Den.—d. June 22, 1932, Copenhagen), Danish veterinarian who in 1897 discovered *Brucella abortus* (Bang's bacillus), the causative agent of contagious abortion in cattle and of brucellosis (undulant fever) in human beings.

After obtaining his M.D. in 1880, Bang began teaching at the Royal Veterinary and

Agricultural College in Copenhagen, later becoming its director. He also served as veterinary adviser to the Danish government. Bang is known for his work on bovine tuberculosis, for which he developed a method of control, and for his research on smallpox vaccination and on bacillary diseases of animals.

Bang, Herman (b. April 21, 1857, island of Als, Den.—d. Jan. 29, 1912, Ogden, Utah, U.S.), novelist who was a major Danish representative of literary Impressionism. His work reflected the profound pessimism of his time.

Bang was the son of a clergyman. Rejected as an actor in 1877, he became a journalist and critic. His first novel, *Håbløse slægter* (1880; "Hopeless Generations"), was confiscated as immoral for its depiction of the life of a decadent homosexual writer. Although he also wrote plays, poetry, short stories, and criticism, Bang is best known for his novels, some of which have been translated into English: *Ludvigsbakke* (1896; *Ida Brandt*) and *De uden faedreland* (1906; *Denied a Country*). The work he did from 1886 to 1890—including a collection of short stories, *Stille existenser* (1886; "Quiet Existences"), and the novels *Stuk* (1887; "Stucco") and *Tine* (1889)—is considered to be his best. Bang died while on a lecture tour of the United States.

Bang Klang Thao, also spelled BANG KLANG HAO (Thai ruler): see Sri Indraditya.

Baṅga (Indian history): see Bengal.

Bangalore, city and capital (since 1830) of Karnāṭaka (formerly Mysore) state, southern India. It is the nation's seventh-largest city. It lies 3,113 feet (949 m) above sea level atop an east-west ridge in the Karnāṭaka Plateau in the southeastern part of the state, at a cultural meeting point of the Kannāḍa-, Telugu-, and Tamil-speaking peoples. Pleasant winters and tolerable summers make it a popular place of residence, but water supply for its increasing industrial and domestic needs is a problem, because its 36 inches (914 mm) of annual rainfall is inadequate and there are no rivers nearby.

The city consists of the closely built old town, together with a number of modern suburbs laid out on a gridiron pattern to the north and south, with many parks and wide streets. A sprawl of military cantonments lies to the east. The city's nucleus was a settlement around a mud fort, built (1537) by a local chief, Kempe Gowda, and constructed of stone in 1761. Bangalore was the headquarters of the British administration from 1831 to 1881, when the raja was restored, but Britain retained an administrative and military presence until 1947.

Aircraft, railway-coach, and machine-tool in-

Vidhāna Saudhā (legislative building) in Bangalore, Karnāṭaka, India

Candida

stallations in the city are run by the federal government; and the state owns electrical and telephone industries and porcelain and soap factories. Privately owned concerns produce pharmaceuticals, textiles, radio parts, glassware, leather and footwear, agricultural implements, paper, and watches. From the late 20th century the city became a centre of high-technology industry, and a number of large multinational technology corporations opened offices there. In addition, the headquarters of such major domestic firms as Infosys and Wipro are in the city.

Situated at the focus of southern India's road system, Bangalore lies on the Vārānasi-Kanniyākumāri National Highway, is connected by major roads with Bombay (Mumbai) and Madras (Chennai), and is linked to Kerala via Mysore city, through the Nilgiris (hills) and Pālgāt Gap. It is also a junction for the Southern Railway's broad-gauge line (from Madras) with an extensive metre-gauge system to the north and west. Hindustan Airport, 5 miles (8 km) east, has scheduled flights to and from Bombay, Madras, Mangalore, and Colombo (Sri Lanka).

Bangalore University (succeeding the branch of the University of Mysore, founded 1916) was opened in 1964, as was the University of Agricultural Sciences. The city also has several evening colleges and a public library and is the site of the Indian Institute of Science (1909), the Raman Research Institute (1943), the National Aeronautical Research Laboratory (1960), and a division of the National Power Research Institute (1960). Bangalore is also a centre for publishing (newspapers and periodicals) and is the headquarters of the regional radio broadcasting station.

Prominent buildings include the legislative building Vidhāna Saadhā (1956), the maharaja of Mysore's palace, and the Mysore Government Museum (1866). Notable local scenic spots are the Lāl Bāgh (a botanic garden laid out in the 18th century), Hesaraghatta Lake, Chamaraja Lake Reservoir, and Nandī (Nandīdrug) Hill Station, a summer resort 38 miles (61 km) north, which is the site of two temples to the god Śiva (Shiva).

The surrounding region is drained by the Arkavati and Kanvā rivers, which are tributaries of the Cauvery. Millet and oilseeds are the main crops, and cattle and sheep are grazed. Pop. (2001 prelim.) 4,292,223.

Bangbu (China): see Pang-pu.

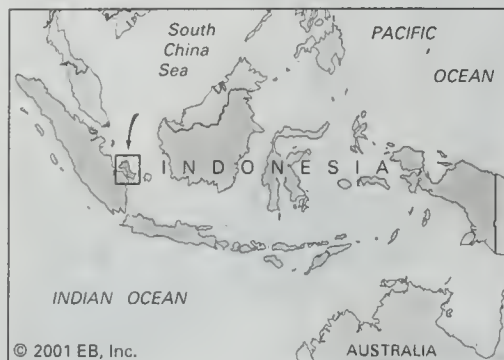

Banggai Islands, Indonesian KEPULAUAN BANGGAI, archipelago consisting of two major islands and approximately 100 islets in Sulawesi Tengah *provinsi* ("province"), Indonesia. The archipelago is situated between the Sula and Celebes islands at the entrance to Tolo Gulf. Peleng, the largest of the Banggai Islands, is well forested and mountainous; the bays affording anchorage have reefs. The chief town and port of the group is Banggai, on the western coast of Banggai Island. The Banggai Islands supply sea cucumbers, turtles, resin, rice, and sago starch.

Banghāzī, also spelled BENGHAZI, Italian BENGASI, city and major seaport of northeastern Libya, on the Gulf of Sidra. It was founded by the Greeks of Cyrenaica as Hesperides (Euesperides) and received from the Egyptian pharaoh Ptolemy III the additional name of Berenice in honour of his wife. After the 3rd century AD it superseded Cyrene and Barce as the chief centre of the region; but its importance waned, and it remained a small town until it was extensively developed during the Italian occupation of Libya (1912–42). In World War II, Banghāzī suffered considerable damage and after changing hands five times

was finally captured by the British in November 1942.

Banghāzī is Libya's second largest city and is an administrative, commercial, and educational centre. It is the site of several national government buildings, as well as the Gar Younis (formerly Benghāzī) University (founded 1955). Local industries include salt processing, oil refining, food processing, cement manufacturing, and tanning, brewing, and fishing. Fresh water is provided by one of the world's largest desalination plants. Benina International Airport is 20 miles (32 km) east of the city. Roads connect Banghāzī with other Libyan centres on the Mediterranean coast. Pop. (1995) 665,615.

Bangka, also spelled BANKA, or BANCA, Indonesian PULAU BANGKA, island of Bangka-Belitung *propinsi* (province), Indonesia. The island is situated off the eastern coast of Sumatra across the Bangka Strait, which is only 9 miles (14 km) wide at its narrowest point. On the east, Gaspar Strait separates Bangka from Billiton (Belitung) island. The soil is somewhat dry and stony but is largely covered with tropical vegetation. The virgin forest has almost disappeared because of mining and agricultural operations. Coastal areas are generally

Bangka

swampy, but the interior is hilly, with elevations up to 2,300 feet (700 m). A number of the island's rivers are tidal in their lower courses and are navigable for nearly 20 miles (32 km) inland. Bangka's climate is hot and wet, with an average annual rainfall of approximately 120 inches (3,000 mm).

Bangka is composed of granite and slate that is often covered with sandstone, laterite, and alluvium. Granite outcrops form short, irregular hill chains. Bangka is one of the world's chief sources of tin. The ore is found in many riverine alluvial deposits and in the alluvial strata on the slopes of small granitic hills; labourers of Chinese descent (Hakka) work in the mines. There are also deposits of lead, copper, tungsten, gold, iron, and manganese.

The island's inhabitants are mainly immigrant Muslim Malays. There are also a few tribes of aboriginal peoples, probably of mixed Malay origin, who live by hunting, fishing, and collecting forest products. Rice, pepper, gambier (the source of an astringent), coffee, and coconut palms are cultivated on the island. The chief town and provincial capital is Pangkalpinang, on the eastern coast, and Muntok, the chief port, is in the northeast.

The sultan of Palembang, in Sumatra, ceded Bangka to the British in 1812, who in 1814 exchanged the island with the Dutch for Cochin in India. Japan occupied Bangka in 1942–45; it was reoccupied by the Dutch in 1946 and became part of independent Indonesia in 1949. In 2000 Bangka, Billiton, and nearby islands were split from Sumatera Selatan province to form Bangka-Belitung province. Area island, 4,375 square miles (16,330 square km); province, 6,244 square miles (16,171 square km). Pop. (2002) province, 900,197.

Bangkok, Thai KRUNG THEP, city, capital, and chief port of Thailand. As the only cos-

mopolitan city in a country of small towns and villages, it is Thailand's cultural and commercial centre. It is a major tourist destination, famous for its cultural and historical sites as well as for its thriving sex trade. In 1971 the original city merged with the former municipality of Thon Buri on the west bank of the Chao Phraya, and in 1972 the unified city was merged with other outlying areas to form a single city province, Krung Thep Mahanakhon (Bangkok Metropolitan City). Area 606 square miles (1,569 square km). Pop. (2000) 6,320,200.

A brief treatment of Bangkok follows. For full treatment, see MACROPAEDIA: Bangkok.

Bangkok is located on the Chao Phraya River, about 25 miles (40 km) from the Gulf of Thailand. The climate is hot throughout the year, with high humidity. The city has traditionally relied on a system of canals to drain its site, which annually receives 60 inches (1,520 mm) of rain. A principal and worsening problem of the city is land subsidence, or sinking, which is exacerbated by filling many canals. Estimates indicate that the city is sinking by some 2 inches (5 cm) per year.

The city's economy is centred on its port, which handles nearly all of the country's exports and imports, and on its commerce and industry. Principal industries include food processing and the production of textiles and building materials. Bangkok houses a majority of the country's bank deposits and also is the base for several insurance firms.

Bangkok has been expanding outward into surrounding agricultural areas. The inner city, formerly enclosed by a wall, has become an institutional and commercial centre, while industrial and residential areas have been shifting to the port and suburbs. Governmental offices are located around the 18th-century Grand Palace. Near the palace is the Wat Pho, which houses a large gold-plate Buddha and is one of the city's largest and oldest temples. The city houses various international agencies as well, including the headquarters of the United Nations Economic and Social Commission for Asia and the Pacific (ESCAP). The Chinese quarter of Sam Peng is an important commercial district. Though the city's residents are predominantly Thai, there are small concentrations of other Asians and of Westerners.

Numerous wats, or Buddhist temples, represent classic Thai architecture and are important cultural features in the city. Ancient art relics and royal objects are housed in the National Museum. Jim Thompson's Thai House contains a major collection of Thai religious paintings assembled by the American silk magnate and art collector. In 1987 the city opened the King Rama IX Royal Park, which includes a water park, extensive botanical gardens, and a building that chronicles the life of King Bhumibol Adulyadej. The National Library and the Thai National Documentation Centre are also located in Bangkok. Among the several universities are Chulalongkorn (1917) and Kasetsart (1943).

Bangkok's inner-city traffic—consisting of three-wheeled taxis, private automobiles, and buses—is extremely congested. Some canals, or klongs, remnants of the city's originally water-based transportation system, still exist, especially in Thon Buri. Highways and railways run north, east, and south from the city, reaching Laos, Cambodia, and Malaysia. The city's Don Muang airport is one of the busiest in Southeast Asia.

Bangladesh, officially PEOPLE'S REPUBLIC OF BANGLADESH, Bengali GANA PRAJĀTANTRĪ BANGLADESH, relatively small coastal country of south-central Asia, covering an area of 56,977 square miles (147,570 square km). The capital is Dhākā (formerly spelled Dacca). To the south Bangladesh has an irregular coastline fronting the Bay of Bengal and is bordered

on the southeast by Myanmar (Burma). The Indian states of West Bengal to the west and north, Assam and Meghālaya to the northeast, and Tripura and Mizorām to the east line the border between Bangladesh and India. Pop. (2005 est.) 137,636,000.

A brief treatment of Bangladesh follows. For full treatment, see MACROPAEDIA: Bangladesh.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

Bangladesh

The land. Bangladesh's low-lying landscape is dominated by the confluence of the Ganges (or Padma, as the united streams of the Ganges and Brahmaputra are known), the Brahmaputra (Jamuna), and the Meghna river systems, which empty into the Bay of Bengal. Bangladesh constitutes the eastern two-thirds of the Ganges-Brahmaputra deltaic plain, stretches northward to include the triangular wedge of land between the Ganges and the Brahmaputra above their confluence, and extends eastward to embrace the valley plain of the Surma River. Farther east the alluvial plains give place to ridges running mainly north-south that form part of the mountain divide with Myanmar in the southeast.

Excepting small higher areas of old alluvium, the whole plain is a flat surface of new alluvium, having a very gentle slope, generally with an elevation of less than 30 feet (9 m) above sea level. More than 90 percent of the area of Bangladesh is composed of plains. Lakes, swamps, and marshes form the other important aspect of the amphibious landscape. On the flatlands, rivers divide and subdivide themselves into numerous distributaries with raised banks. Hundreds of square miles of land are flooded during the monsoon season.

South-central Bangladesh comprises an old western delta, with dead and decaying rivers, and the eastern new delta, with active rivers carrying on depositional or constructive work. The southern coastal belt, which carries the mangrove forests (Sundarbans), is a salt marsh. The narrow southeastern coastal belt near Noākhāli and Chittagong is formed of both old and recent alluvium. East of the southeastern coastal belt lies the Chittagong Hill Tracts, a hilly area consisting of low hills of soft rocks, mainly clay and shale. Its north-south ranges are generally below 2,000 feet (610 m), the highest peak, Mt. Mowdock, rising to 3,455 feet (1,053 m).

The climate and hydrology of Bangladesh are dramatically affected by the annual summer monsoon (June through October); three-quarters of the country's precipitation occurs during this five-month period. During the monsoon many rivers overflow their banks and inundate the countryside; these floods deposit fertile silt on the nation's farmland but also damage crops and sometimes take a heavy toll of both human and animal life. The hydrology of the Chittagong highlands is also important because the power plant at the Karnaphuli dam (forming the Karnaphuli Reservoir) provides much of the country's hydroelectric capacity. Annual precipitation varies from a low of 40 to 80 inches (1,000 to 2,000 mm) in the

western lowlands to more than 150 inches in the Sylhet Hills in the northeast. The temperature varies generally between 70° F (21° C) in the winter and 95° F (35° C) in the summer. In the early summer (April and May) and late in the monsoon season, high-intensity storms, including cyclones with winds exceeding 100 miles (160 km) per hour and waves with crests as high as 20 feet (6 m), have frequently inundated the extensive coastal lowland areas of Bangladesh. Since the early 18th century, when such records were first kept, hundreds of thousands of people have been killed by such storms, and some 950,000 died in four storms alone (1737, 1876, 1970, and 1991).

More than two-thirds of Bangladesh's land is considered arable and lies primarily in the lowland regions; one-fifth is irrigated. Forests cover about one-tenth of the country. Plant and animal life includes royal Bengal tigers, clouded leopards, and Asian elephants, all endangered species.

The people. The vast majority of the country's population are Bengalis, who speak an eastern Indo-Aryan language related to Sanskrit. More than four-fifths of the population are Muslims (largely Sunnis), and about one-eighth are Hindus. The Chittagong Hill Tracts in southeastern Bangladesh are inhabited largely by tribal peoples, including the Chakmā, the Marma, the Tripura (Tipra), and the Mro, who are predominantly Buddhists.

Bangladesh is one of the most densely populated countries in the world, with the highest densities occurring in and around Dhākā. It is also a predominantly rural country, with only about one-fourth of the population living in urban areas. Rural areas are often so thickly settled that it is difficult to distinguish any well-defined pattern of individual villages. Bangladesh has a high rate of population growth, with fairly high birth and modest death rates; one-third of the population is under 15 years of age. Life expectancy at birth is about 61 years for both males and females.

The economy. Bangladesh has a developing mixed economy. Agriculture, once dominant, now accounts for about one-fifth of the gross domestic product (GDP). The service sector (including trade and transportation) constitutes about half of GDP, and manufacturing (notably wearing apparel) is growing in importance. The gross national product (GNP) is increasing steadily, but the GNP per capita is among the lowest in the world.

Bangladesh has few natural resources apart from its farmland, which is in any case inadequate to feed the large and rapidly growing population. Cereals, principally rice as well as wheat, are the main crops, occupying most of the cultivated land. Sugarcane, jute, pulses, fruits (bananas, mangoes, and pineapples), roots and tubers, and vegetables are also grown. Other crops include tobacco, sesame seed, and tea. The principal livestock are cattle, goats, water buffalo, and sheep.

Coastal waters of the Bay of Bengal offer excellent marine fishing, and Bangladesh's innumerable rivers, estuaries, and swamps are ideally suited for freshwater fishing, yielding most of the total catch.

Natural gas is the country's richest mineral resource; its production is expanding and supplies domestic needs. Most petrochemicals and metals must be imported. The manufacturing sector is largely concentrated on processing agricultural materials or imported raw materials. Important manufactures include urea fertilizer (partly derived from natural gas), jute textiles, rerolled-steel products, crude-steel ingots, paper and newsprint, refined sugar, petroleum products, chemicals, tea and other food products, and cotton yarn and cloth. More than nine-tenths of the electric power is produced by thermal plants and the rest by hydroelectric-power stations.

Bangladesh possesses the world's longest beach, 75 miles (120 km) in length at Cox's

Bāzār, and the cities of Chittagong and Dhākā also attract numerous foreign tourists.

Three-fifths of the country's workforce is still employed in agriculture, followed by services and manufacturing. Many Bangladeshis have found overseas employment in the construction and petroleum industries in the Middle East, and remittances sent home by these workers have been an important source of revenue. Bangladesh depends heavily on foreign aid for its economic development. The World Bank, the United States, and Japan have been the principal donors of aid.

The railway system is government owned and operated, and there is a government road-transport (trucking) corporation. About one-tenth of the roads are paved. Navigable inland waterways are well developed, and there are five principal river ports and seaports at Chālna and Chittagong. Dhākā and Chittagong have international airports.

Bangladesh's exports, in value, equal about two-thirds of its imports and consist primarily of woven garments, hosiery, and knitwear; frozen fish and shrimp; and jute manufactures. Major export destinations are the United States, Germany, and the United Kingdom. Imports consist primarily of capital goods; textile yarn, fabrics, and made-up articles; and imports for export processing. The principal sources for imports are China (including Hong Kong), India, Singapore, and Japan.

Government and social conditions. Bangladesh is an independent republic within the Commonwealth. The country's government is ostensibly democratic; according to a 1991 amendment of the constitution (1972), legislative power is vested in the Parliament (Jatiya Sangsad), whose members are elected by universal suffrage to five-year terms. Executive power is exercised by a Council of Ministers under the leadership of the prime minister, who is designated by the majority party or coalition in Parliament. The president is the ceremonial head of state and is elected by Parliament to a five-year term. In reality, democracy has had very little opportunity to function in Bangladesh, because of almost continual domination of the country's politics by the military. When there have been elections, the outcomes have been dominated largely by the Bangladesh Nationalist Party (BNP), an organization incorporating several different political groups.

Severe overcrowding, an inadequate food supply (a large portion of the population subsist almost solely on rice), and poor sanitary conditions have combined to create extremely poor health conditions in Bangladesh. A significant number of citizens suffer from such infectious diseases as malaria, cholera, and tuberculosis. Government efforts to significantly improve health conditions in Bangladesh have failed, mostly because of the country's shortage of physicians and modern medical facilities and the prevailing poor sanitation.

The government offers children primary education, which is free but not compulsory, for five years; only about two-thirds of the children attend primary school. The literacy rate in Bangladesh remains extremely low by world standards. There are general universities, specialized (agricultural, and engineering and technological) universities, and an Islāmic university.

Bangladesh's broadcasting media are controlled by the government. Most of the newspapers are privately owned, and the press is relatively free.

Cultural life. An important part of the Bengali cultural heritage is represented by literature. Rabindranath Tagore, winner of the Nobel Prize for Literature in 1913, wrote many of his poems and short stories about the beautiful Bengali countryside, most of all

about the Ganges River. His song "Our Golden Bengal" became the national anthem of Bangladesh.

History. Mention of a deltaic kingdom known as Vanga, or Banga (hence, Bengal and Bangladesh), is found in the early Sanskrit literature of India (c. 1000 BC). By the 4th century BC, Bengal was part of the Indian Maurya empire (c. 325–185 BC) and was exposed to Buddhism. In the 4th century AD, it passed to the Gupta dynasty of the Magadha state in northeastern India. Two native Bengali dynasties, the Pāla and Sena, ruled in succession from about 750 to 1200. Despite the many years of Buddhist rule (only the Guptas were Hindu), Bengal was predominantly Hindu by the 10th century.

Muslim raids began on northern India at the close of the 10th century, and a dynasty known as the Slave, or Mamlūk, dynasty was founded at Delhi in 1206. In 1338 Bengal was able to separate itself from the Delhi sultanate and remain independent until its conquest by the Mughals in 1576. During the centuries of Muslim political and military dominance, the majority of the population in what is now Bangladesh were converted to Islām.

Europeans began arriving as traders during the Mughal period. In 1651 the British East India Company established a factory (trading settlement) in Bengal. A decline in Mughal authority in Bengal corresponded with a rise in the company's concern for its Bengal operation. At the Battle of Plassey (1757), Robert Clive, acting for the company, defeated the nawab (ruler) of Bengal and placed in office a successor more sympathetic to British interests. By 1765 the East India Company had secured the revenue rights (dewanee) for Bengal, which marked the beginning of the British Empire's rule in India.

British policies caused much economic hardship for the people of Bengal. Local handicraft industries, especially the muslin industry, were ruined by the introduction of British machine-made goods, and much of the country's natural wealth was drained off to England. Enmity between Hindus and Muslims was exacerbated by British policies, and the British, responding to Muslim pressure, partitioned Bengal in 1905 and created a Muslim-dominated East Bengal. One year later, the Muslim League, a communal organization seeking to safeguard the rights of Indian Muslims, was formed in Dacca (now Dhākā).

Hindu reaction to the partition was extreme, and the British rescinded the partition in 1912, but the problem between the Hindus and Muslims continued to fester. When the British left the subcontinent in 1947, East Bengal became East Pakistan, a part of the Muslim state of Pakistan, but it was separated from the dominant West Pakistan by great distance and by a different language and culture.

Bengali nationalist sentiment increased with the establishment of Pakistan. The Awami League (AL), a political party, campaigned openly for Bengali autonomy. In 1970 the AL won a majority of seats in the National Assembly, but the Pakistan government postponed convening the Assembly. Violence erupted and guerrilla warfare resulted. Millions of refugees fled to India, which finally entered the war on the side of the Bengalis and ensured West Pakistan's defeat. On Dec. 16, 1971, East Bengal became the independent state of Bangladesh, with its capital at Dhākā.

The destruction caused by the war was immense, and political stability proved difficult to regain. Founding president Sheikh Mujibur Rahman was assassinated in 1975, as was his successor, Zia ur-Rahman, in 1981. Hossain Mohammad Ershad took control in another military coup in 1982 and assumed the presidency in 1984; he was forced to resign in 1990.

In 1991 the electorate made the presidency a figurehead position and elected as prime minister Khaleda Zia, wife of Zia ur-Rahman and head of the BNP. Parliamentary elections were held again in 1996, and another woman, Sheikh Hasina Wazed of the AL, became prime minister; Zia and a BNP-led coalition returned to power in 2001. The terms of both Zia and Hasina were marred by violence and political turmoil, and cyclones and floods continued to exacerbate the country's problems. In 1999 the government established the autonomous Chittagong Hill Tracts "tribal region" for non-Bengali peoples.

Bangni (people): *see* Dafla.

Bangor, Irish BEANNCHUAR, town, North Down district (established 1973), formerly in County Down, Northern Ireland. It lies on the southern shore of Belfast Lough (inlet of the sea). About 555, St. Comgall founded a monastery at Bangor, which became a celebrated seat of learning. Incursions by Danes in the 9th century destroyed Bangor, which was partially rebuilt by St. Malachy in the 12th century. Part of his stone church remains. Bangor is now a seaside resort with a small harbour serving as the headquarters of the Royal Ulster Yacht Club; it has some light industry. Pop. (2001) 58,388.

Bangor, city, seat (1816) of Penobscot county, east-central Maine, U.S. It is a port of entry at the head of navigation on the Penobscot River opposite Brewer. The site, visited in 1604 by Samuel de Champlain, was settled in 1769 by Jacob Buswell. First called Kenduskeag Plantation (1776) and later Sunbury (1787), it was incorporated as a town in 1791 and is thought to have been named Bangor by the Reverend Seth Noble for his favourite hymn tune. It was briefly held by the British in the War of 1812. After 1830 it became a leading lumber port with shipbuilding yards. It is now a commercial centre with manufactures including paper, electronic equipment, and forest products. The city is the seat of Bangor Theological Seminary (founded 1814), Beal College (1891), Husson College (1898), and Eastern Maine Technical College (1966). Bangor International Airport occupies a former air force base. The main campus of the University of Maine (1865) is just upriver at Orono. Inc. city, 1834. Pop. (2004 est.) city, 31,595; Bangor MSA, 148,196.

Bangor, cathedral city, Gwynedd county, historic county of Caernarvonshire (Sir Gaernarfon), Wales. It commands the northern entrance to the Menai Strait, the narrow strip of water separating Anglesey from the mainland. Bangor Cathedral is dedicated to the Celtic St. Deiniol, who founded a church there in the 6th century; the community was a leading centre of Celtic Christianity. The cathedral, built during the 12th and 13th centuries, later underwent a series of restorations after damage by invading Normans, the English king John, and the early 15th-century Welsh rebel leader Owen Glendower. The present structure was restored in 1866. Bangor, which grew up beside a Norman castle (few traces of which remain), is notable mainly as a cultural centre. It has the University College of North Wales (1884), a group of the theological colleges, and a museum of Welsh antiquities. Port Penrhyn nearby grew as an outlet for slates from the quarries near Bethesda. Penrhyn Castle, northeast of Bangor, is a modern copy of a Norman castle. Pop. (2001) 13,725.

Bangui, capital of the Central African Republic, on the west bank of the Ubangi River. The city is connected by an extensive river and rail transport system with Pointe-Noire, on the African coast, and with Brazzaville (both in Congo [Brazzaville]). The river port development includes a quay 1,300 feet (400 m) long and an oil port downstream. Diamonds, cot-

Édouard-Renard Place in Bangui, Central African Republic

Picturepoint, London

ton, timber, coffee, and sisal are shipped from Bangui. Bangui is served by Bangui-M'Poko International Airport and by ferry service to Zongo, Congo (Kinshasa). There is also a network of roads connecting Bangui with Cameroon, Chad, and the upper Central African Republic. Industries in Bangui include soapmaking and brewing, but the city is mainly a commercial and administrative centre.

Bangui is the site of the University of Bangui (1969), the National School of Arts (1966), several scientific and technological research institutes, and the National Ethnological Museum (Barthélemy Boganda Museum). The city suffered significant looting and damage during coup attempts in the late 1990s and early 2000s. Pop. (2003 prelim.) 551,763.

Bangweulu (Bantu: "Large Water"), shallow lake with extensive swamps in northeastern Zambia. It is part of the Congo (Zaire) River system. Lying at an elevation of 3,740 feet (1,140 m), the waters of Bangweulu, fluctuating with the rainy season, cover a triangular area of about 3,800 square miles (9,800 square km). The lake, at the triangle's northwest corner, is 45 miles (72 km) long and 24 miles (38 km) wide. There are three inhabited islands in the lake and many low islands in the swamps. The swamplands result from excessive vegetation along the course of the Chambeshi River, where they act as a check to the annual flooding, releasing the floodwaters slowly through a myriad of channels and lagoons, to issue as the Luapula River. The vegetation responsible for the swamps consists of a common water reed, *Phragmites communis*, growing just above mean water level; a zone of papyrus at water level; and a floating grass, called hippo-grass, in deeper water. The lake's fish are caught, dried, and exported to the copper-mining belt 100 miles (160 km) to the west. The explorer-missionary Dr. David Livingstone, the first European to visit the lake (1868), died on its southern shore (1873).

Banhā, also spelled BENHA, town, capital of Al-Qalyūbiyah *muḥāfaẓah* (governorate), Lower Egypt. The town lies on the right (east) bank of the Damietta Branch of the Nile and on the At-Tawfiqī Canal in the delta area. It is about 30 miles (48 km) northwest of Cairo on the highway to Alexandria. Its Arabic name is derived from the Coptic name Panaho. Since the early European Middle Ages, Banhā has been known for the production of quality honey. It is situated in the heart of a highly fertile cotton-growing district, and its industries include cotton ginning, manufacture of cotton and flax textiles, and vegetable processing. It is also well known for its oranges and grapes. Its historic position on the direct route from Cairo to Alexandria made it first a road centre and later a principal rail focus of Egypt. Lines from Banhā link Cairo to Ismailia on the Suez Canal (east) via Az-Zaqāzīq and to Alexandria, via Ṭanṭā and

Damanhūr (northwest). Close by are mounds of the site of the ancient town of Athribis. Pop. (1986 prelim.) 115,571.

Banī, city, southern Dominican Republic, situated in coastal lowlands 3 mi (5 km) from the Caribbean Sea. The city is a commercial and manufacturing centre for the fertile agricultural hinterland, whose main products are bananas, rice, and coffee. The city lies on the paved highway linking Santo Domingo, the national capital, with Commendador, near the Haitian border. Pop. (1993) 47,655.

Banī Ḥasan (Egypt): *see* Beni Hasan.

Banī River, principal affluent of the Niger River on its right bank in Mali, West Africa, formed by the confluence of the Baoulé and Bagoé headstreams 100 mi (160 km) east of Bamako. The Bani proper flows 230 mi northeast to the Niger at Mopti in the swampy Macina depression. It is navigable only in part. Within a savanna zone, the region derives its wealth from the cultivation of millet, rice, sorghum, and corn along the riverbanks and from cattle herding.

Banī Suwayf, *muḥāfazah* (governorate), lying along the Nile River in northern Upper Egypt, with an extension into the Western Desert at its southern end, with al-Fayyūm governorate to the west and north and al-Minyā to the south. Its cultivated, settled area consists mainly of a strip of the Nile River Valley floodplain, extending about 50 mi (80 km) north-south and 15 mi in width at its widest point, near Banī Suwayf city. It has a total settled area of 510 sq mi (1,322 sq km). Because the river throughout history has eroded away the eastern bank, it now embraces only a narrow, gravelly plain terminating abruptly below the bluffs of the Eastern Desert. In 1964 Banī Suwayf *muḥāfazah* pioneered a nationally supervised cooperative-farming scheme in which scattered land holdings were consolidated into large units. Cotton, grains, beans, and sugarcane are the principal crops, and chickens and pigeons are also raised. The capital, Banī Suwayf (*q.v.*), is a regional market. In the Eastern Desert alabaster is quarried, and there are iron-ore deposits in the desert to the west.

Among the *muḥāfazah*'s antiquities are the 3rd-dynasty (c. 2686–2613 BC) pyramid of Huni at Maydūm, and the ruins of ancient Heracleopolis lie near the village of Iḥnāsiyat al-Madīnah, west of Banī Suwayf city near the Baḥr Yūsuf, an irrigation canal, which turns north of the site into al-Fayyūm governorate. The Cairo–Aswān railway stops at Banī Suwayf city, from where a branch runs into al-Fayyūm. Pop. (1996 prelim.) 1,860,180.

Banī Suwayf, also spelled BENI SUEF, city, capital of Banī Suwayf *muḥāfazah* (governorate), northern Upper Egypt. It is an important agricultural trade centre on the west bank of the Nile, 70 mi (110 km) south of Cairo.

In the 9th and 10th dynasties (c. 2160–2040 BC), Heracleopolis (modern Iḥnāsiyat al-Madīnah), 10 mi west of the modern city, was the capital of kings who ruled Lower and Middle Egypt. During the first millennium BC a Libyan family settled there and gained sovereignty over all of Egypt, founding the 22nd dynasty (c. 950–c. 730 BC). Later, though losing political importance, it remained an important city. In later centuries Banī Suwayf became the chief town of the second province of Upper Egypt, attaining special prominence under the Turkish governor and the autonomous ruler Muḥammad 'Alī (ruled 1805–48). Banī Suwayf's industries, mostly agriculturally related, include flour milling, cotton ginning, and textile manufacturing. Alabaster is quarried near the capital. Perennial irrigation water is supplied by the large Baḥr Yūsuf Canal. It is on the main rail line along

the Nile; a branch railroad connects it to the al-Fayyūm oasis complex of agricultural settlements. The oldest mosque, Jāmi' al-Baḥr, has a shrine that is locally venerated. Pop. (1996 prelim.) 172,032.

Bania, also spelled BANĪYĀ (from Sanskrit *vāṇijya*, "trade"), Indian caste consisting generally of moneylenders or merchants, found chiefly in northern and western India; strictly speaking, however, many mercantile communities are not Banias, and, conversely, some Banias are not merchants. In the fourfold division of Indian society, the innumerable Bania subcastes, such as the Agarwālā (*q.v.*), are classed as members of the Vaiśya, or commoner, class. In religious affiliation they are generally Vaiṣṇavas (worshippers of the Hindu god Vishnu) or Jains and tend to be strict vegetarians, teetotalers, and orthodox in observing ceremonial purity. The Indian leader Mahatma Gandhi belonged to a Gujarati Bania caste.

Banihāl Pass, pass in the Pir Panjāl Range in the Indian-held sector of the state of Jammu and Kashmir in the northern part of the Indian subcontinent. Banihāl—a name that in Kashmīrī means "blizzard"—lies at an altitude of 9,290 ft (2,832 m) in the Doda district. It forms the main gateway to the Vale of Kashmir from the Indian plains. The Jammu–Srinagar road enters the pass through the Jawahar Tunnel, which is occasionally blocked by snow in winter. Goods formerly crossed the pass on the backs of porters, who made the journey in a day.

Banim, John and Michael (respectively b. April 3, 1798, County Kilkenny, Ire.—d. Aug. 13, 1842, County Kilkenny; b. Aug. 5, 1796, County Kilkenny—d. Aug. 30, 1874, Booterstown, near Dublin), brothers who collaborated in novels and stories of Irish peasant life.

John studied drawing in Dublin and subsequently taught it in Kilkenny. Shortly afterward he went to Dublin, where he earned a living by journalism. In 1821 his blank verse tragedy, *Damon and Pythias*, was produced at Covent Garden; John married, moved to London, and continued to live by journalism. In 1825 there appeared *Tales, by the O'Hara Family*, written in collaboration with Michael, who had studied for the bar but had had to take over his father's business. All three *Tales*—two by John, *The Fetches* and *John Doe*, and one by Michael, *Crohoore of the Bill Hook*—are remarkable for their melodramatic invention and were immediately successful, John being dubbed "the Scott of Ireland." He followed them with *The Boyne Water* (1826), a novel about the Jacobite wars in Ireland, and in 1826 a second series of *Tales* appeared, containing *The Nowlans*, a story of passion, guilt, and religious fervour displaying a degree of insight that makes it possibly John's best novel. *The Croppy* (1828) is mainly by Michael, then an active supporter of Roman Catholic emancipation.

Despite a painful spinal malady, John continued to produce novels; but ill health eventually led to poverty, and in 1833 subscriptions were opened for him in England and Ireland. He returned to Kilkenny in 1835. *Father Connell*, the Banims' happiest book, published the same year, was almost entirely by Michael, who continued to write but in 1873 retired to Booterstown, near Dublin.

Banja Luka, also spelled BANJALUKA, city, northeast Bosnia and Herzegovina, on the Vrbas River at its confluence with the Vrbanja. Under the Turks, Banja Luka (Baths of St. Luke) was an important military centre and the original location (1583–1639) of the seat of the Bosnian *pašalik* (territory governed by a pasha). Commercial growth declined following fires and plagues in the 17th and 18th centuries. In the 19th century Banja Luka played an important part in the uprisings of the

Bosnians against Turkey, as well as in the revolts of the Serbs. Again, during World War II, the city and district were a resistance centre while part of the Axis-created country of Croatia.

Since 1945 a new industrial section of the city has been developed. Banja Luka was seriously damaged by an earthquake in 1969 and subsequently underwent extensive rebuilding. During the civil war between Serbs and Muslims that followed Bosnia's secession from Yugoslavia in 1992, Banja Luka became the main Bosnian Serb centre in the northern part of the country. In 1993 Bosnian Serbs destroyed two large mosques in the city dating from the Ottoman period, the Ferhadija, or Ferhad-Pasha (1579–83), and the Arnaudija (1587) mosques. Banja Luka's industries include fruit and vegetable canning, tobacco processing, brewing, and the manufacture of machine tools, electrical appliances, clothing, pulp and paper, and synthetic fibres. The city has road connections with Zagreb and with Jajce and Sarajevo. Pop. (1991) 143,079; (1997 est.) 160,000.

Banjarmasin, also spelled BANDJARMASIN, or BANJERMASIN, *kotamadya* (city), capital of Kalimantan Selatan *propinsi* (South Borneo province), Indonesia, on Tapas island between the Barito and Martapura rivers on the southern coast of Borneo. The rivers drain the largest plain on Kalimantan. To the east the Pegunungan (mountains) Meratus range, lacking roads, is largely inaccessible. Houses are raised on piles, gardens are walled and drained, and rivers and streams are used in place of roads, though there is an airfield. There is a good harbour, from which rubber, pepper, timber, rattan, cordage fibres, oil, gold, diamonds, coal, and iron are exported. The coal comes from the nearby town of Pengaron, lumber from Alalak and Cerucuk, and bricks and earthenware from Sungri Tabok. A sultanate was originally centred there, and, despite treaties signed with the Dutch East India Company in the 18th century, this sultanate was a centre of resistance against the Dutch government for most of the 19th century. Pop. (1995 est.) 482,931.

banjo, stringed musical instrument of African origin, popularized in the U.S. by slaves in the

Five-string banjo; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York City. The Crosby Brown Collection of Musical Instruments, 1889

19th century, then exported to Europe. Several African stringed instruments have similar names—e.g., *bania*, *banju*. The banjo has a tambourine-like body with a hoop and a screw that secure the vellum belly to the frame. Screw stretchers are used to vary the tension of the belly. The strings pass over a violin-type, or pressure, bridge and are hitched to a tail-piece. In the 1890s, frets were added to the long neck, and a machine head with screws replaced the tuning pegs.

The earliest banjos had four gut strings; later, from five to nine metal strings were used. The standard banjo has five metal strings. Four are tuned from the head, usually to C'-G'-B'-D'' upward from (notated) middle C. Preceding the C string is the chanterelle, or thumb string, a shorter string fastened to a screw midway in the banjo neck. It is tuned to the (notated) second G above middle C. The actual pitch is an octave lower than notated.

A plectrum banjo lacks the chanterelle and is played with a plectrum rather than with the fingers. On a zither banjo the vellum is suspended in a resonator that throws the sound forward; the chanterelle, tuned from the head, passes under the fingerboard to emerge at the fifth fret. The banjo is widely played in U.S. folk music and has also been used in jazz ensembles.

banjo clock, clock so named because its upper portion is shaped like an inverted banjo, patented by Simon Willard of Connecticut in 1802. The clock has a circular face with a narrow metal frame and bezel for the glass, which

Banjo clock by Simon Willard, American, c. 1810; in the Museum of Fine Arts, Boston

By courtesy of the Museum of Fine Arts, Boston, M. & M. Karolik Collection

is usually dome shaped. The top bears a finial. Below, a narrow trunk, slightly wider at the bottom than the top, holds the weight, and at the bottom a wider compartment holds the bob. Slender, concave metal ornaments connect the three main parts of the clock. On the finest banjo clocks, bracket-shaped pendants are added below.

banjo shark: see guitarfish.

Banjoewangi (Indonesia): see Banyuwangi.

Banjul, formerly (until 1973) BATHURST, city and capital, and Atlantic port of The Gambia, on St. Mary's Island, near the mouth of the Gambia River. It is the country's largest city. It was founded in 1816, when the British Colonial Office ordered Capt. Alexander Grant to establish a military post on the river to sup-

The port of Banjul, near the mouth of the Gambia River, in The Gambia

Kjell Johansson—Ostman Agency

press the slave trade and to serve as a trade outlet for merchants ejected from Senegal, which had been restored to France. Grant chose Banjul Island (ceded by the chief of Kombo) as the site, which he renamed St. Mary's. He named the new settlement for Henry Bathurst, 3rd Earl Bathurst, then colonial secretary. It became the capital of the British colony and protectorate of Gambia and after 1947 was governed by a town council. With The Gambia's independence in 1965, the town was granted city status and became the national capital. The name was changed to Banjul in 1973.

Banjul is The Gambia's commercial and transportation centre. It has several peanut (groundnut) decorticating plants and oil mills; peanuts, peanut oil and meal, and palm kernels are exported. Tourism is of increasing importance, alleviating some of the urban unemployment problem and encouraging handicraft (wood carvings, filigree jewelry, hand-dyed cloth) industries. Banjul is connected with the interior and Senegal via a 3-mi (5-km) ferry northward across the Gambia River (to Barra) and by a road that joins the Trans-Gambia Highway just south of Mansa Konko. A regular steamer service operates to Basse Santa Su, 242 mi upstream. The Gambia's international airport is at Yundum, 14 mi southwest.

The nation's educational centre, Banjul has the Gambia High School (1958), two Roman Catholic secondary schools, a Muslim high school, a vocational school, and a public library. Associated with the city's Royal Victoria Hospital (1957) are the Gambia School of Nursing (1964), a mental hospital, a tuberculosis sanatorium, and a home for the infirm.

Almost half of the city's population is Wolof, but the Aku (descendants of freed slaves), Malinke (Mandingo), Mauritanian, and Lebanese communities are significant minorities. Banjul has a mosque and Anglican, Catholic, and Methodist churches. Pop. (1993) 42,326; urban agglom., 270,540.

Banjuwangi (Indonesia): see Banyuwangi.

bank, an institution that deals in money and its substitutes and provides other financial services. Banks accept deposits and make loans and derive a profit from the difference in the interest rates paid and charged, respectively. Some banks also have the power to create money. The principal types of banking in the modern industrial world are commercial banking and central banking.

Another type, merchant banks, engage in investment banking activities, including counseling in merger and acquisition activity. Other institutions are often called banks but do not perform the banking functions described above. Best classified as financial intermediaries, these institutions channel capital from private individuals to those who use it in

the form of loans for building purposes or for the purchase of capital assets. They include finance companies, savings banks, investment banks, trust companies, and home-loan banks.

The business of banking consists of borrowing and lending. As in other businesses, operations must be based on capital, but banks employ comparatively little of their own capital in relation to the total volume of their transactions. Instead banks maintain capital and reserve accounts to provide protection against losses on loans and investments.

Functions of commercial banks. Commercial banks deal in money and its substitutes, such as checks or bills of exchange. In the United States, commercial banks are allowed to underwrite corporate debt and common stock deals. They also provide a variety of other financial services. The basis of the banking business is borrowing from individuals, firms, and occasionally governments—i.e., receiving "deposits" from them. With these resources along with its own capital, the bank makes loans, extends credit, and invests in securities. It makes profit by borrowing at one rate of interest and lending at a higher rate and by charging commissions for services rendered.

A bank must always maintain cash balances to pay its depositors upon demand. It must also keep a proportion of its assets in forms that can readily be converted into cash. Only in this way can confidence in the banking system be maintained.

A simplified balance sheet can be used to describe the essential characteristics of the banking business. The bank's main liabilities are its capital (including cash reserves and, often, subordinated debt) and deposits. The latter may be from domestic or foreign sources (corporations and firms, private individuals, other banks, and even governments). They may be repayable on demand (sight deposits or current accounts) or after a period of time (time, term, or fixed deposits and, occasionally, savings deposits). The bank's assets include cash, investments or securities, loans and advances made to customers of all kinds, though primarily to corporations (including term loans and mortgages); and, finally, the bank's premises, furniture, and fittings.

The main resource of a modern bank is borrowed money (that is, deposits), which is lent out as profitably as possible without incurring to great a risk. An increase in deposits provides a bank with additional cash, which supplements its loanable resources and permits a more than proportionate increase in its loans. Increases in deposits arise in two ways: (1) When a bank makes a loan, it may transfer the sum to a current account, thus directly creating a new deposit; or it may arrange a line of credit upon which the borrower will be permitted to draw checks, which, when deposited by third parties, likewise create new deposits. (2) An enlargement of government expenditure financed by the central bank may also occasion a growth in deposits, since claims on the government that are equivalent to cash will be paid into the commercial banks as deposits. In the first instance, the increase in bank deposits raises the potential liability to pay out cash; in the second case, the increase in the commercial bank deposits is accompanied by a corresponding increase in commercial bank holdings of money claims that are equivalent to cash.

Except in countries where banks are small and insecure, as a whole they can usually depend on their current account debits being largely offset by credits to current accounts, though from time to time an individual bank may experience marked fluctuations in its deposit totals. Even when deposits are repayable on demand, there is usually a degree of inertia in the deposit structure that prevents sharp fluctuations; if money is accepted contractually for a fixed term or if notice must be given

before its repayment, this inertia will be greater. On the other hand, if a significant proportion of total deposits derives from foreign sources, there is likely to be an element of volatility arising from international conditions.

In banking, confidence on the part of the depositors is the true basis of stability, and confidence is steadier when a central bank acts as a "lender of last resort." In some countries confidence is maintained through deposit insurance, which protects the small depositor against loss in the event of a bank failure.

Since a bank undertakes to provide depositors with cash on demand or upon prior notice, it is necessary to hold a cash reserve and to maintain a "safe" ratio of cash to deposits. The safe ratio may be established by convention (as it was for many years in England) or by statute (as in the United States and elsewhere). If a minimum cash ratio is required by law, a portion of a bank's assets is in effect frozen and not available to meet sudden demands for cash from the bank's customers. To provide more flexibility, required ratios are frequently based on the average of cash holdings over a specified period, such as a week or a month. In addition to holding part of the bank's assets in cash, a bank will hold a proportion of the remainder in assets that can quickly be converted into cash without significant loss.

Unless a bank held cash equivalent to 100 percent of its demand deposits, it could not meet the claims of depositors were they all to exercise in full and at the same time their right to demand cash. If that were a common phenomenon, deposit banking could not survive. For the most part, however, the public is prepared to leave its surplus funds on deposit with banks, confident that money will be available when needed. But there may be times when unexpected demands for cash exceed what might reasonably have been anticipated; therefore, a bank must not only hold part of its assets in cash but also must keep a proportion of the remainder in assets that can be quickly converted into cash without significant loss.

A bank may mobilize its assets in several ways. It may demand repayment of loans, immediately or at short notice; it may sell securities; or it may borrow from the central bank, using paper representing investments or loans as security. Banks do not precipitately call in loans or sell marketable assets, because this would disrupt the delicate debtor-creditor relationship and risk a loss of confidence, probably resulting in a run on the banks. Banks must therefore maintain their cash reserves and other liquid assets at a high level or have access to a "lender of last resort," such as a central bank. In a number of countries, commercial banks have at times been required to maintain a minimum liquid assets ratio. Among the assets of commercial banks, investments are less liquid than money-market assets. By maintaining an appropriate spread of maturities (through a combination of long-term and short-term investments), however, it is possible to ensure that a proportion of a bank's investments will regularly approach redemption. This produces a steady flow of liquidity and thereby constitutes a secondary liquid assets reserve.

Responsibilities of central banks. Another type of banking is carried on by central banks, bankers to governments and "lenders of last resort" to commercial banks and other financial institutions. They are often responsible for formulating and implementing monetary and credit policies, usually in cooperation with the government. In some cases—*e.g.*, the U.S. Federal Reserve System—they have been established specifically to lead or regulate the banking system; in other cases—*e.g.*, the Bank of England—they have come to perform these functions through a process of evolution.

The first concern of a central bank is the

maintenance of a soundly based commercial banking structure. While this concern has grown to include all financial institutions. A central bank must also cooperate closely with the national government. Indeed, most governments and central banks have become intimately associated in the formulation of policy.

Recent developments. The introduction of a single currency, the euro, in most of the 15 nations of the European Union, the enactment of financial modernization legislation in the United States, and the accelerating pace of industry-wide consolidation on a global basis have created far-reaching implications for banking in the 21st century.

As of Jan. 1, 2001, 12 countries had joined the Economic and Monetary Union (EMU). Responsibility for monetary policy within the EMU shifted from the central banks of individual countries to the European Central Bank, and the money markets of the EMU's 12 member countries have merged into a single market. These changes contributed to an increase in merger activity across Europe. For example, Banco Bilbao Vizcaya SA and Argentaria (both of Spain) merged in 2000. In France, Banque Nationale de Paris acquired Paribas in 1999 to form BNP Paribas.

Consolidation also occurred among Japanese banks with a three-way merger involving Fuji Bank, Dai-Ichi Kangyo Bank, and Industrial Bank of Japan in October 2000.

In the United States, the Gramm-Leach-Bliley Act (1998) marked the end of barriers between banking, securities, and insurance that had been created by the Glass-Steagall Act (1933). This legislation was widely expected to lead to further consolidation of financial services, particularly mergers involving American commercial banks and insurance firms. The first major consolidation between a banking organization and an insurance company occurred in 1998 when Citicorp merged with the Travelers Group to create Citigroup.

bank, rocky or sandy submerged elevation of the seafloor with a summit less than 200 m (650 feet) below the surface but not so high as to endanger navigation. Many banks are local prominences on continental or island shelves. Similar elevations with tops more than 200 m below the surface are called oceanic plateaus. Banks whose tops rise close enough to the sea surface to be hazardous to shipping are called shoals. Some banks provide favourable conditions for marine life and are therefore important fishing grounds—*e.g.*, the Grand Banks of Newfoundland.

bank holiday, in the United Kingdom, any of several days designated as holidays by the Bank Holidays Act of 1871 and a supplementary act of 1875 for all the banks in England, Wales, Northern Ireland, and Scotland. Although these days are not statutory public holidays, their observance is no longer limited to banks.

Before 1830 the Bank of England closed on approximately 40 saints' days and anniversaries, but in that year the number was reduced to 18 days. In 1834 they were further reduced to four: Good Friday, May 1, November 1, and Christmas Day. By the act of 1871, the following were constituted bank holidays in England, Wales, and Ireland: Easter Monday; Whitmonday, the first Monday of August; December 26 if a weekday; and, by the act of 1875, December 27 when December 26 falls on a Sunday (*i.e.*, the first weekday after Christmas; Boxing Day). The Bank Holiday (Ireland) Act of 1903 designated March 17, St. Patrick's Day (or, if on a Sunday, the following Monday), as a bank holiday for Ireland. In England, Wales, and Northern Ireland, Christmas Day and Good Friday are bank holidays under common law.

In Scotland, New Year's Day and the day after, Christmas Day (or, if these days fall on Sunday, the following Mondays), Good Fri-

day, Labour Day (May 1), and the first Monday of August are bank holidays.

The act of 1871 also made it lawful for any day to be officially proclaimed a bank holiday in the United Kingdom. In the 1980s the list for England, Wales, and Northern Ireland included New Year's Day, or the first Monday in January if January 1 falls on a Saturday or Sunday; Good Friday; Easter Monday; May 1 (Labour Day), or the first Monday in May if May 1 falls on a Saturday or Sunday; the last Monday in May; the last Monday in August; Christmas Day; and Boxing Day.

Bank of——: *see under* substantive word (*e.g.*, England, Bank of), except as below.

Bank of America Corporation, banking and financial services corporation formed through the 1998 merger of NationsBank and BankAmerica. One of the largest banking organizations in the United States, Bank of America is headquartered in Charlotte, N.C.

The bank's history dates to 1904 when Amadeo Peter Giannini opened the Bank of Italy in San Francisco. It eventually developed into the Bank of America and was for a time owned by Giannini's holding company, Transamerica Corporation. In 1968 BankAmerica Corporation was organized in Delaware as a holding company for Bank of America NT & SA and other financial subsidiaries. BankAmerica's acquisitions included the 1983 purchase of Washington state bank Seafirst Corp. in what was the biggest U.S. interstate bank merger to date. In 1991 BankAmerica purchased Security Pacific Corporation, its major competitor in California.

Bank of China Building, triangular glass tower in Hong Kong, completed in 1990. It houses the Hong Kong headquarters of the Peking-based central Bank of China, together with other tenants.

When built, the skyscraper, at 1,209 feet (369 m), was the tallest building in the world outside the United States. Designed by the American architect I.M. Pei, it has a distinctive three-dimensional triangular shape (quadrilateral at the bottom and trilateral at the top), which, according to Pei, transfers "all vertical stress to the four corners of the building, making it very stable and wind resistant" (an important consideration in typhoon-threatened Hong Kong). The interior floors are irregular, ending in points and angles, and are completely sided by windows, with multiple views. The building is topped by twin poles, a purely decorative flourish.

Bank of New York Company, Inc., The, major American bank holding company, headquartered in New York City.

The Bank of New York was founded in 1784 and chartered in 1791. Alexander Hamilton wrote the bank's constitution and in 1789 was instrumental in securing the first loan obtained by the United States. Other loans by the bank contributed to the construction of the Erie Canal and the New York City subway system.

From the 1920s to the '60s it merged with a number of other banks, and in 1968 The Bank of New York, Inc., was incorporated as the holding company for the various subsidiaries, including The Bank of New York, much enlarged. In 1969 the holding company assumed the current name. Thereafter it acquired several banking, financial, and investment firms, mostly in New York state but also elsewhere in the United States and overseas. The vigorous expansion was marked especially by the 1988 takeover of the giant Irving Bank Corporation (founded in 1851).

The Bank of New York Company oversees commercial banking and trust and investment services for banks, corporations, institutions, and individuals. It conducts national and in-

ternational wholesale banking services, as well as retail banking services throughout New York state.

Bank One, former U.S. bank holding company based in Chicago, Ill., that merged with J.P. Morgan Chase & Co. in 2004. The newly merged banking company retained the name J.P. Morgan Chase, while Bank One's commercial and consumer businesses assumed the Chase brand. Corporate headquarters are in New York with headquarters for retail operations in Chicago.

Bank One had been formed through the 1998 merger of First Chicago NBD Corp. and Banc One. Although the 1998 merger created one of the country's largest banks, it performed poorly until Jamie Dimon, a former Citigroup executive, became chief executive officer in 2000 and revamped operations. Bank One's businesses included commercial banking, retail banking in more than a dozen states, credit card services, business loans, and financial management for individuals and corporations.

bank rate: *see* discount rate.

Bank Street College of Education, privately supported graduate school of education in New York City offering graduate courses only, operating a laboratory school, and conducting basic research in education. Established in 1916 by Lucy Sprague Mitchell, first dean of women at the University of California and an adherent of John Dewey's teachings, the institution was at first called the Bureau of Educational Experiments.

In 1950 the school's name was changed to the Bank Street College of Education. In 1964 Bank Street helped launch the National Head Start Program for pre-school disadvantaged children; beginning in 1965 the school published the Bank Street Readers, an early contribution to multiracial, urban-oriented teaching materials. It acted as a consultant for children's television and for school and child-care facilities all over the world and developed mainstreaming programs for handicapped children.

Consult the INDEX first

Bank War, in U.S. history, the struggle between President Andrew Jackson and Nicholas Biddle, president of the Bank of the United States, over the continued existence of the only national banking institution in the nation during the second quarter of the 19th century. The first Bank of the United States, chartered in 1791 over the objections of Thomas Jefferson, ceased in 1811 when Jeffersonian Republicans refused to pass a new federal charter. In 1816 the second Bank of the United States was created, with a 20-year federal charter.

In 1829 and again in 1830 Jackson made clear his constitutional objections and personal antagonism toward the bank. He believed it concentrated too much economic power in the hands of a small monied elite beyond the public's control. For support, Biddle turned to the National Republicans—especially Henry Clay and Daniel Webster—turning the issue into a political battle. On their advice, Biddle applied for a new charter even though the old charter did not expire until 1836.

The recharter bill easily passed both houses of Congress in 1832. Saying "The bank is trying to kill me, but I will kill it," Jackson issued a potent veto message. The fate of the bank then became the central issue of the presidential election of 1832 between Jackson and Clay. Jackson concluded from his victory in that election that he had a mandate not only to refuse the bank a new charter but to destroy

as soon as possible what he called a "hydra of corruption." (Many of his political enemies had loans from the bank or were on its payroll.)

Jackson ordered that no more government funds be deposited in the bank. Existing deposits were consumed paying off expenses, while new revenues were placed in 89 state "pet banks." Biddle responded by calling in loans and thus precipitating a credit shortage and business downturn. Clay in 1834 pushed a resolution through the Senate censuring Jackson for removing the deposits.

Jackson held firm. Biddle was eventually forced to relax the bank's credit policies, and in 1837 the Senate expunged the censure resolution from its record. When the bank's federal charter finally expired, Biddle secured a state charter from Pennsylvania to keep the bank operating. But in 1841 it went out of business, the result of faulty investment decisions and national economic distress.

Banka (Indonesia): *see* Bangka.

bankruptcy, the status of a debtor who has been declared by judicial process to be unable to pay his debts.

A brief treatment of bankruptcy follows. For full treatment, *see* MACROPAEDIA: Business Law.

The terms bankruptcy and insolvency, although sometimes used indiscriminately, have distinct legal significations. Insolvency, as the term is used in the equity receivership courts in the United States, in state insolvency laws, and in the English and most European bankruptcy laws, means inability to meet debts as they mature; but in England, for example, there is no special procedure relating to one who is merely "insolvent." Insolvency as it is defined in the U.S. federal bankruptcy act means that the aggregate of the debtor's property, at a fair valuation, is insufficient to pay his debts. A debtor may be insolvent without becoming a bankrupt.

Conversely, because proof of insolvency is not required where the debtor files a voluntary petition in bankruptcy or where an involuntary petition filed by his creditors alleges the commission of certain acts of bankruptcy, a debtor may become a bankrupt without being insolvent. A bankruptcy adjudication is a legal declaration that the debtor has filed a proper voluntary petition or that creditors have filed and supported a proper involuntary petition against him. The adjudication initiates a statutory proceeding for the administration of the debtor's property, which is thereby taken out of his personal control.

The primary objects of bankruptcy legislation are to obtain justice while not pressing unduly on debtors, to discriminate between involuntary inability to meet obligations and willful refusal or neglect, and to secure to creditors an equitable share of the debtor's assets available for the payment of his liabilities. Another object has marked modern legislation, namely, the fostering of a higher tone of commercial morality and the protection of the trading community at large from the evils arising through the reckless abuse of credit and through unnatural trade competition. Because creditors have conflicting interests and are therefore incapable of acting together as a homogeneous body, it is necessary to obtain the aid of professional assignees or trustees, solicitors, and other agents, who make it their special business to deal with such matters, exercising both administrative and quasi-judicial functions, in return for the remuneration that they receive out of the property for their services.

In common-law countries today, rehabilitation of the bankrupt is a major concern, provided, of course, that his insolvency did not involve fraud. Such relief for honest debtors dates back as far as 1705 in England, when a statute was passed establishing that, once a debtor had complied with the court's deci-

sions, he was released from obligation. Such a release, or discharge, may, however, be conditional. Modern attitudes in civil-law countries as well as in common-law countries regard liquidation as something to be avoided if possible, and efforts are made to enlist the creditors in plans to rehabilitate the estate.

Banks, Sir Joseph, BARONET (b. Feb. 13, 1743, London, Eng.—d. June 19, 1820, Isleworth, London), British explorer and naturalist, and long-time president of the Royal Society, known for his promotion of science.

Banks was schooled at Harrow and Eton and attended Christ Church, Oxford, from 1760 to 1763; he inherited a considerable fortune from his father in 1761. Banks then traveled, collecting plant and natural history specimens, to Newfoundland and Labrador (1766), around the world with Captain James Cook (1768–71), and to Iceland (1772).

Banks was interested in economic plants and their introduction into countries; he was the first to suggest (1805) the identity of the wheat rust and barberry fungus; and he was the first to show that marsupial mammals were more primitive than placental mammals. In his role as honorary director of the Royal Botanic Gardens at Kew (near London), he sent many botanical collectors to various countries. His house became a meeting place for the exchange of ideas. After he became president of the Royal Society (1778–1820), he improved the position of science in Britain and cultivated interchange with scientists of other nations; he was, however, accused by many scientists of exercising excessive authority as president and even of being "despotic." In 1781 he was made a baronet. The order of Knight Commander of the Bath was bestowed upon him in 1795, and two years later he was admitted to the Privy Council.

Sir Joseph Banks, engraving by Ridley, 1802
The Mansell Collection

Banks's herbarium, considered one of the most important in existence, and his library, a major collection of works on natural history, are now at the British Museum. *Banks' Florilegium*, a collection of engravings of plants compiled by Banks and based on drawings by Swedish botanist Daniel Solander during Cook's 1768–71 voyage, was not published in full until 1989.

Banks, Nathaniel P., in full NATHANIEL PRENTISS BANKS (b. Jan. 30, 1816, Waltham, Mass., U.S.—d. Sept. 1, 1894, Waltham), American politician and Union general during the American Civil War, who during 1862–64 commanded at New Orleans.

Banks received only a common school education and at an early age began work as a bobbin boy in a cotton factory. He subsequently edited a weekly paper at Waltham, studied law, and, after being admitted to the bar, became active in politics. He served in the Massachusetts legislature (1849–53) and as president of the state constitutional convention in 1853. In that year he entered

the U.S. Congress, holding the support of Democrats and Free-Soilers for a time, and later of the Know-Nothing Party. He joined the newly formed Republican Party in 1855 and in 1856, after a bitter and protracted contest, was elected speaker of the House of Representatives on the 133rd ballot. He served in Congress until elected governor of Massachusetts in 1858.

Although while governor he had been a strong advocate of peace, Banks was one of the earliest to offer his services to President Lincoln, who in 1861 appointed him a major general of volunteers. He served in the campaigns of early 1862 in the Shenandoah valley and later in the year was in command of the Department of the Gulf in New Orleans. Forces under his command laid siege to Port Hudson, La., which finally fell in July 1863. In 1863 and 1864 he organized a number of expeditions in Texas, but he proved unsuccessful as a tactician, and his Red River expedition (March–May 1864) ended in disaster.

After the war Banks reentered politics, serving several more terms in Congress and as U.S. marshal for Massachusetts (1879–88).

Banks, The (North Carolina, U.S.): see Outer Banks.

Banks Island, westernmost island in the Canadian Arctic Archipelago, Inuvik region, Northwest Territories; it lies northwest of Victoria Island and is separated from the mainland (south) by Amundsen Gulf. About 250 miles (400 km) long and 110–180 miles (180–290 km) wide, it has an area of 27,038 square miles (70,028 square km). Its hilly terrain ranges from 1,100-foot (335-metre) cliffs along the north shore to Durham Heights (2,500 feet [760 m]) at the southern tip. The island is the habitat of Arctic fox, wolf, caribou, polar bear, and many birds. First sighted by Sir William Parry's expedition in 1820, it was named for Sir Joseph Banks. Vilhjalmur Stefansson explored the interior in 1914–17.

Eastern shoreline of Banks Island, Northwest Territories

Joe Rycheltnik—Photo Researchers/EB Inc

Sachs Harbour on its southwest coast, with air service to Inuvik on the mainland, is a base for trappers (especially of white fox) and for oil exploration. Pop. (1996) 135.

Banks Islands, volcanic group in Vanuatu, southwestern Pacific Ocean. They include the islands of Vanua Lava, Santa Maria (Gaua), Mota, and Mota Lava (Saddle) and numerous islets. First explored in 1793 by Captain William Bligh of the British navy and named by him after his patron, the naturalist Sir Joseph Banks, the group enjoys sufficient rainfall and is covered by forest. The northernmost islet, Uréparapara, is a volcanic cone that has been breached by the sea, thus creating Dives Bay in its east coast. Several of the islands have active volcanoes. The islands' Polynesian inhabitants cultivate copra and coffee for export. Pop. (1989) 5,502.

Banks Peninsula, peninsula in eastern South Island, New Zealand, extending 30 miles (48 km) into the Pacific Ocean. It is bounded by Pegasus Bay (north) and Canterbury Bight (south) and has a total land area of about

500 square miles (1,300 square km). Generally hilly, it rises as high as 3,012 feet (918 m) at Herbert Peak. The peninsula was originally an island formed by two contiguous volcanic cones but was joined to the mainland by sediments of the Waimakariri River. It was visited (1770) by Captain James Cook, who named it after Sir Joseph Banks, and it was surveyed by John Stokes (1850). In the early 19th century, whalers and sealers made use of Lyttelton and Akaroa harbours, occupying the breached craters of the volcanoes. Later in the century, the peninsula was stripped of its forests. Agriculture (sheep, grass seed, and garden products) is now the most important economic activity. Christchurch, the largest city of South Island, lies just northwest of the peninsula.

Bānkura, town, western West Bengal state, northeastern India. It lies just north of the Dhāleśwari (Dhalkisor) River. As a major

Farmland in the locality of Bānkura, West Bengal, India

Kaypix—Shostal Assoc/EB Inc

Grand Trunk Road and rail junction, Bānkura is an agricultural distributing centre. Rice and oilseed milling, cotton weaving, metalware manufacture, and railway workshops are the major industries. Constituted a municipality in 1869, Bānkura has several colleges, including a medical school, affiliated with the University of Burdwān.

Bānkura lies on a densely populated alluvial plain. Rice, wheat, corn (maize), and sugarcane are the chief crops in the surrounding agricultural area; mica, china clay, iron-ore, lead, zinc, and wolframite deposits are also worked in the locality. The area long remained a focus of Hindu culture based on the Mallabhūm kingdom, with its capital at Bishnupur. Pop. (1991) 114,876.

Bann, River, Irish AN BHANNA, river, the largest in Northern Ireland, falling into two distinct parts. The upper Bann rises in the Mourne Mountains and flows northwest to Lough (lake) Neagh. The lower Bann flows northward through Lough Beg and carries the waters of Lough Neagh to the sea below Coleraine. The total length is 80 miles (129 km). The lower river occupies a peaty depression in the basalt plateaus of Ballymena, Ballymoney, Coleraine, and Magherafelt districts. Upstream the waterpower from the river played an important part in the industrialization of the Ulster linen industry. The river has valuable salmon and eel fisheries, and its valley contains prehistoric remains of the Mesolithic and Neolithic periods. The chief town on the upper Bann is Portadown, near Lough Neagh.

Bannatyne, George (b. 1545, Newtyle, Angus, Scot.—d. 1608?), compiler of an important collection of Scottish poetry from the 15th and 16th centuries (the golden age of Scottish literature).

A prosperous Edinburgh merchant, he compiled his anthology of verse, known as the *Bannatyne Manuscript*, while living in isolation during a plague in 1568. His anthology contains many of the best-known poems of

the courtly poets known as makaris, or Scottish Chaucerians; it also preserves work by such poets as Alexander Scott who otherwise would be virtually unknown, and it includes much interesting anonymous verse as well. It influenced the 18th-century Scottish revival, when Allan Ramsay reprinted a number of the poems (though often in altered form) in his *Ever Green* (1724). In 1823 the Bannatyne Club was founded in Edinburgh for the purpose of promoting the study of Scottish history and literature.

Bannatyne, John: see Bellenden, John.

Banneker, Benjamin (b. Nov. 9, 1731, Ellicott's Mills, Md.—d. Oct. 25, 1806, Baltimore, Md., U.S.), mathematician, astronomer, compiler of almanacs, inventor, and writer, one of the first important black American intellectuals.

A free black who owned a farm near Baltimore, Banneker was largely self-educated in astronomy by watching the stars and in mathematics by reading borrowed textbooks. In 1761 he attracted attention by building a wooden clock that kept precise time. Encouraged in his studies by a Maryland industrialist, Joseph Ellicott, he began astronomical calculations about 1773, accurately predicted a solar eclipse in 1789, and published annually from 1791 to 1802 the *Pennsylvania, Delaware, Maryland, and Virginia Almanac and Ephemeris*. Appointed to the District of Columbia Commission by President George Washington in 1790, he worked with Andrew Ellicott and others in surveying Washington, D.C.

As an essayist and pamphleteer, Banneker opposed slavery and war. He sent a copy of his first almanac to Thomas Jefferson, then U.S. secretary of state, along with a letter asking Jefferson's aid in bringing about better conditions for American blacks. Banneker's almanacs were acclaimed by European scientists to whom Jefferson made them known.

Banner system, Chinese (Wade-Giles romanization) CH'Y-PING, Pinyin QIBING, the military organization used by the Manchu tribes of Manchuria (now Northeast China) to conquer and control China in the 17th century. The Banner system was developed by the Manchu leader Nurhachi (1559–1626), who in 1601 organized his warriors into four companies of 300 men each. The companies were distinguished by banners of different colours—yellow, red, white, and blue. In 1615 four more banners were added, using the same colours bordered in red, the red banner being bordered in white. As the Manchus increased their conquests, the size of the companies grew until each came to number 7,500 men divided into five regiments, divided, in turn, into four companies.

All of Nurhachi's followers, with the exception of a few imperial princes, were organized into this Banner system, which also served an administrative function. Taxation, conscription, and registration of the population was carried out through the banner organization. The bannermen lived, farmed, and worked with their families during times of peace, and in times of war each banner contributed a certain number of fighting men.

As the Manchus began to conquer their Chinese and Mongol neighbours, they organized their captives into companies modeled after the banners. In 1634 eight Mongol banners were added to the Manchu system, and in 1642 eight Chinese banners were added. The new banners, which fought alongside the old, brought to 24 the total number of banner units. With these troops, the Manchus were able to conquer China and establish the Ch'ing dynasty (1644–1911/12).

After the establishment of the dynasty, a constabulary Army of the Green Standard was garrisoned throughout the country to quell minor disturbances; this army consisted mainly of former Ming remnants and local forces. The main Manchu force continued to be the 24 banners, which were garrisoned at the capital in Peking and in several selected strategic spots throughout the country, where they could be called quickly in the event of an emergency.

In the early Ch'ing period the emperor controlled only three of the eight Manchu banners, the others being under the rule of various imperial princes. But when the emperor Yung-cheng ascended the throne in 1722, he took control of all eight banners to prevent his brothers from attempting to usurp the throne. Thereafter, the banners were the sole possession of the Ch'ing emperors and their greatest source of power.

The bannermen were considered a form of nobility and were given preferential treatment in terms of annual pensions, land, and allotments of rice and cloth. Manchu bannermen were on the whole treated better than their Mongol and Chinese counterparts, but all were prohibited from participating in trade and manual labour unless they petitioned to be removed from banner status. Moreover, those who broke the law were not tried before an ordinary civil magistrate but by a special Manchu general.

During the century and a half of peace following the establishment of the Ch'ing, the fighting qualities of the banner forces deteriorated, and their training was neglected. During the White Lotus Rebellion (1796-1804) and then again during the Taiping Rebellion (1850-64), the banners were unable to protect the dynasty, and the government eventually had to organize other forces. By the end of the 19th century the Banner System, with the exception of a few thousand bannermen trained in modern methods and weapons, had become totally ineffective.

banneret, a European medieval knight privileged to display in the field a square banner (as distinct from the tapering pennon of a simple knight). The term was used in countries of French and English speech from the 13th to the 16th century. In 13th-century England any commander of a troop of 10 or more lances who was not a count or an earl was usually a banneret. Later, in both England and France, the style became a title of honour, conferred for distinguished military service. There is no connection between the style of banneret and the baronetage (hereditary knighthood) established in England by King James I in 1611.

Bannerman, Henry: *see* Campbell-Bannerman, Sir Henry.

banning, in South Africa, an administrative action by which publications, organizations, or assemblies could be outlawed and suppressed and individual persons could be placed under severe restrictions of their freedom of travel, association, and speech. Banning was an important tool in the South African government's suppression of those opposed to its policy of apartheid.

The power to ban publications rests with the minister of the interior under the Publications and Entertainments Act of 1963. Under the act a publication could be banned if it was found to be "undesirable" for any of many reasons, including obscenity, moral harmfulness, blasphemy, causing harm to relations among sections of the population, or being prejudicial to the safety, general welfare, peace, or order of the state. Thousands of books, newspapers, and other publications were banned in South Africa from 1950 to 1990.

The banning of organizations or of individuals was originally authorized by the Suppression of Communism Act of 1950, with many subsequent amendments; these laws were superseded by the Internal Security Act of 1982, which retained nearly all their provisions. Under the older laws the minister of law and order could ban an organization found to be promoting or aiding the objects of communism, or to be likely to promote such objects. The definitions of communism and of the objects of communism were very broad and included any activity allegedly promoting disturbances or disorder; promoting industrial, social, political, or economic change in South Africa; and encouraging hostility between whites and non-whites so as to promote change or revolution. The power to label an organization or individual as communist or revolutionary rested with the minister. The main organizations banned under these laws were the Communist Party of South Africa, the African National Congress (ANC), and the Pan-African Congress.

The banning of individuals in South Africa was a practice virtually unique among nations with legal systems derived from Roman or common-law traditions. At the order of the minister, a person deemed a communist, a terrorist, a member of a banned organization, or otherwise a threat to the security and public order of the state could be confined to his home or immediate surroundings; prohibited from meeting with more than one person at a time (other than his family); forced to resign any offices in any organization; prohibited from speaking publicly or writing for any publication; and barred from certain areas, buildings, and institutions, such as law courts, schools, and newspaper offices. Moreover, the banned person could not be quoted in any publication. The effect was to render the banned person a public nonentity. More than 2,000 people were banned in South Africa from 1950 to 1990.

In 1990 the South African government lifted its ban on the ANC and many other opposition groups, as well as on a large number of individual anti-apartheid activists.

Banningville (Zaire): *see* Bandundu.

Bannister, Sir Roger (Gilbert) (b. March 23, 1929, Harrow, Middlesex, Eng.), English neurologist who was the first athlete to run a mile in less than four minutes.

While a student at the University of Oxford and at St. Mary's Hospital Medical School, London, Bannister won British (1951, 1953-54) and Empire (1954) championships in the mile run and the European title (1954) in the 1,500-metre event. He broke the four-minute barrier with a time of 3 min 59.4 s in a dual meet at Oxford on May 6, 1954. Breaking the world record (4 min 1.3 s), held for nine years by Gunder Hägg of Sweden, was

Bannister, 1951
EB Inc

almost incidental to his successful defiance of the "psychological" barrier, the general belief in the impossibility of running a mile in less than four minutes. Bannister is said to have achieved his speed through scientific training methods and thorough research into the mechanics of running. He recounted his experiences in the book *The Four Minute Mile* (1955).

Bannister graduated from St. Mary's in 1954, earned a medical degree from Oxford in 1963, and became a neurologist. He wrote papers on the physiology of exercise, heat illness, and neurological subjects, and from 1969 on he edited *Brain's Clinical Neurology* (retitled *Brain and Bannister's Clinical Neurology*, 7th ed., 1990). He was knighted in 1975.

Bannock, Indian tribe of the Great Basin area of North America. In historical times and probably before 1700 the Bannock ranged through southern Idaho, especially along the Snake River and its tributaries. Linguistically they were most closely related to the Northern Paiute of eastern Oregon, from whom they were separated by 200 miles (320 km). According to both Paiute and Bannock legend, the Bannock went to Idaho to live among the Shoshoni and hunt buffalo.

The culture of the Bannock was very much the Plains type in its emphasis on buffalo, the horse, and a seminomadic life. Seasonal migrations carried them west during summer to the Shoshone Falls for salmon, small game, and berries, and northeast in the fall to hunt buffalo in the Yellowstone area of Wyoming and Montana. The latter expeditions allowed the band chief to acquire power over hunting and subsistence activities and also required a good deal of cooperation with the Shoshoni, among whom the Bannock lived and with whom they shared a common enemy in the fierce Blackfoot, who controlled the buffalo-hunting grounds in Montana.

The Bannock were not numerous, probably never reaching more than 2,000, but they had considerable influence in inciting their more pacific neighbours to revolts and raids against the whites. Famine, frustration over the disappearance of the buffalo, and insensitive reservation policy by the U.S. government led to the Bannock War in 1878, which was suppressed with a massacre of about 140 Bannock men, women, and children at Charles's Ford in what is now Wyoming.

The independence and cultural autonomy of the Bannock did not survive the confinement of reservation life; by 1900 there were only about 500 Bannock left, much intermarried with Shoshoni, their tribal identity and warrior traits extinguished.

bannock, flat, sometimes unleavened bread eaten primarily in Scotland. Although most commonly made of oats, bannocks of barley, ground dried peas, and a combination of grains are sometimes encountered. Selkirk bannock is made from wheat flour and contains fruit.

The word bannock derives from the Latin *panicum*, denoting an edible, milletlike grain. Special bannocks were once made for holidays and religious feasts, such as Beltane bannocks on the first of May and Lammas bannocks on the first day of autumn. Stirring the batter for bannocks counterclockwise was popularly thought to bring bad luck.

A well-known tale of King Alfred indicates that bannocks were once commonly eaten in England. The king, unrecognized, sought hospitality at a cottage during his campaign against the Danes. He was set to minding the bannocks that were baking at the hearth and was scolded by the mistress of the house when through inattention he allowed the cakes to burn.

Bannockburn, former town, now part of Stirling, central region, Scotland. With its original

location slightly to the east of the famous battlefield to which it lent its name, Bannockburn was known in the 18th and 19th centuries for cottage weaving and tartan and carpet manufacture.

The Battle of Bannockburn, fought June 23–24, 1314, was a decisive event in Scottish history. In 1964, on the 650th anniversary of the battle, an equestrian statue of Robert I the Bruce was unveiled on the site by Queen Elizabeth II.

Bannockburn, Battle of (June 23–24, 1314), decisive battle in Scottish history, whereby the Scots under Robert the Bruce defeated the English under Edward II, regained their independence, and established Bruce on his throne as Robert I.

By the time of the battle, all Scotland had been cleared of English troops with the exception of Stirling Castle, which the governor had promised to surrender if not relieved by June 24. To meet the large army that Edward II had collected for this purpose, Bruce assembled his smaller force first at Torwood and then at the new park, a mile or two south of Stirling, where the trees would hamper attack by the superior English cavalry. He had taken up his position there when the English vanguard appeared on June 23.

The Scottish army, consisting almost entirely of pikemen, was outnumbered by at least three to one by the English foot soldiers and cavalry; but, by masterly use of the terrain, the Scots were able to overcome the superior numbers of the enemy. The English army, confined in a small, marsh-bordered area between the Bannock Burn (stream) and the River Forth, had insufficient room for their cavalry and men to maneuver effectively. Bruce took advantage of the enemy's confusion and attacked. The defeated English army was finally put to flight by a charge of about 2,000 Scots—whether light armed troops or camp followers is uncertain—who swept down from Gillies Hill, which overlooked the battlefield to the west. The subsequent slaughter was immense, and many of those who survived the wrath of the Scots perished in the Bannock Burn and the morasses beyond. Edward II escaped by a circuitous route to Dunbar and thence to England.

Exact estimates of the numbers engaged are impossible, but the English had probably about 3,000 horse and 20,000 foot, the Scots perhaps 10,000 altogether or even as few as 5,000. English losses in killed and prisoners included the earls of Gloucester and Hereford, more than 60 barons and bannerets, and many scores of knights. The Scots claimed to have lost only two knights but numerous pikemen. The Scots regard the battle as the culmination of their War of Independence.

Bannu, town, central part of North-West Frontier province, Pakistan, just south of the Kurram River. The nearby Akra mounds have revealed finds dating to about 300 BC. In ancient and medieval times, the Kurram-Bannu route into the Indian subcontinent was used by invaders and colonizers from the northwest. Founded in 1848 by Lieutenant (later Sir) Herbert Edwardes as a military base, the town was named Dalipnagar (1848) and then Edwardesābād (1869). In 1903 its name was changed to Bannu.

Bannu lies at the centre of a circular alluvial plain, hemmed in by low hills and drained by the Kurram River and its tributary, the Tochi (Gambila). The nearby Kurram-Garhi Project (completed 1962) provides irrigation, power, and flood control. Wheat, corn (maize), and barley are the chief crops of the region. Bannu is a military station and commercial centre at the junction of roads running from the Indus River to Peshāwar and Waziristān and is connected with the Indus by rail. Local industries include a large woolen mill. Bannu is the seat of a college affiliated with the University

of Peshāwar. Inhabitants are mainly Pashtun tribal people. Pop. (1981) 35,170.

Banpocun (Chinese site): see Pan-p'o-t's'un.

Bansang, town, east-central Gambia, on the south bank of the Gambia River. A local trade centre in peanuts (groundnuts), rice, and fish among the Malinke (Mandingo), Fulani (Fula), and Wolof peoples, it is a port of call for the government steamer from Banjul, 188 miles (303 km) downstream. Bansang is the site of the only government hospital in the interior; the associated Leprosy Village at Alla Tentu is 1.5 miles (2.5 km) northwest. Pop. (1983 prelim.) 4,137.

banshee, Irish BEAN SIDHE, Scots Gaelic BAN SITH ("woman of the fairies"), supernatural being in Irish and other Celtic folklore whose mournful "keening," or wailing screaming or lamentation, at night was believed to foretell the death of a member of the family of the person who heard the spirit. In Ireland banshees were believed to warn only families of

Banshee, from *Fairy Legends and Traditions of the South of Ireland* (1825–28), by Thomas Croker

By courtesy of the Folklore Society Library, University College, London, photograph, R.B. Fleming

pure Irish descent. The Welsh counterpart, the *gwrach y Rhibyn* ("witch of Rhibyn"), visited only families of old Welsh stock.

The Scottish novelist Sir Walter Scott mentioned belief in a kind of banshee or household spirit in certain Highland families (*Letters on Demonology and Witchcraft*, 1830).

Banská Bystrica, German NEUSOHL, Hungarian BESZTERCEBÁNYA, town, capital of Strední Slovensko kraj, Slovakia. It lies in the Hron River valley, surrounded by mountains. An ancient town, it has been an important mining centre since the 13th century, when it was chartered. Gothic and Renaissance-style buildings, including burghers' houses and the castle group (in the heart of town), date from the 15th and 16th centuries, when the silver and copper mines supplied much of the European market. On Aug. 29, 1944, Banská Bystrica was the scene of the Slovak national uprising against the Germans. The Old Town Hall (1479) contains a museum commemorating this event.

Town square in Banská Bystrica, Slovakia
FPG

Since World War II, Banská Bystrica has developed as an industrial centre for the manufacture of textiles, paper, metal products, and cement. It is also a popular summer and winter resort. Pop. (1991 prelim.) 85,007.

Banstead (England): see Reigate and Banstead.

Bānswāra, city, southern part of Rājasthān state, northwestern India. Bānswāra is an agricultural market centre. Its principal industries include cotton ginning, flour milling, handweaving, and woodworking. A walled city, it was founded in the early 16th century. A government college there is affiliated with the University of Rājasthān.

The area around Bānswāra is comparatively flat and fertile, the principal river being the Mahi. Corn (maize), wheat, and gram (chick-pea) are the chief crops; iron-ore, lead, zinc, silver, and manganese deposits are worked.

The area formerly constituted the princely state of Bānswāra, founded about 1530, of which the city of Bānswāra was capital. Earlier it formed part of the original Dūngarpur state. It merged with the union of Rājasthān in 1948. Pop. (1991 prelim.) 66,676.

Bantam, Bahasa Indonesia BANTEN, former city and sultanate of Java, Indonesia. It lay near the site of present-day Banten, on Banten Bay, at the extreme northwest of the island, just north of Serang. Now in ruins, Bantam was the most important Javanese port for the spice trade with Europe from the 16th century until the end of the 18th, when its harbour silted up. Its site is now more than 1 mile (1.6 km) from the sea. Ruined buildings include the Pakuwonan palace (1680), Fort Speelwijk, and several mosques, the oldest of which dates from 1562. Under Dutch occupation Bantam was the westernmost residency of Java, comprising the districts of Pandeglang, Serang, and Lebak. The people of the region are still known for their fervid devotion to Islām. Bantam fowl were erroneously thought to have originated there.

banteng, also called BALI CATTLE (species *Bos banteng*), a species of wild Southeast Asian cattle, family Bovidae (order Artiodactyla),

Banteng (*Bos banteng*)
Tom McHugh—Photo Researchers

found in hill forests. A shy animal resembling a domestic cow, the banteng attains a shoulder height of about 1.5–1.75 m (60–69 inches). It has a slight ridge on the back, a white rump, white "stockings" on the legs, and slender, curving horns. Bulls are dark brown or black, and cows and young are reddish brown. The banteng is kept as a domestic animal in some areas.

Banting, Sir Frederick Grant (b. Nov. 14, 1891, Alliston, Ont., Can.—d. Feb. 21, 1941, Newfoundland), physician who, with Charles H. Best, was first to obtain (1921) a pancreatic extract of insulin. Working in the laboratories of the Scottish physiologist J.J.R. Macleod at the University of Toronto, they were able to isolate the hormone in a form consistently effective in treating diabetes. In 1923 Banting became head of the university's Banting and Best Department of Medical Research and was corecipient with Macleod of the 1923 Nobel Prize for Physiology or Medicine for the discovery of insulin. Banting voluntarily

shared his portion of the award with Best, and he was created a knight of the British Empire in 1934. He was killed in a plane crash while on a war mission.

Bantry Bay, long inlet of the Atlantic Ocean, southwestern County Cork, Ireland. The bay has a maximum length of 30 miles (48 km) and is 10 miles wide at its broadest point; it separates the Caha peninsula to the north from the Sheep's Head peninsula to the south, and is surrounded by mountains. Bantry Bay was entered in 1689 and 1796 by French fleets attempting invasions of Ireland. On Whiddy Island there are 19th-century relics of a British naval station, and a large oil terminal. The town of Bantry is located near the head of the bay.

Bantu Homeland (South Africa): *see* black state.

Bantu languages, a group of some 500 languages belonging to the Bantoid subgroup of the Benue-Congo branch of the Niger-Congo language family. The Bantu languages are spoken in a very large area, including most of Africa from southern Cameroon eastward to Kenya and southward to the southernmost tip of the continent. Twelve Bantu languages—including Rundi, Rwanda, Shona, Xhosa, and Zulu—are spoken by more than five million people each. Swahili, which is spoken by five million people as a mother tongue and some 30 million as a second language, is a Bantu lingua franca important in both commerce and literature.

Much scholarly work has been done since the late 19th century to describe and classify the Bantu languages. Special mention may be made of Carl Meinhof's work in the 1890s, in which he sought to reconstruct what he called ur-Bantu (the words underlying contemporary Bantu forms), and the descriptive work carried out by Clement Doke and the Department of Bantu Studies at the University of Witwatersrand, South Africa, in the period 1923–53. A monumental four-volume classification of Bantu languages, *Comparative Bantu* (1967–71) by Malcolm Guthrie, is the standard reference book.

Bantu peoples, any of the more than 85,000,000 speakers of some 500 distinct languages of the Bantu subgroup of the Niger-Congo language family, occupying almost the entire southern projection of the African continent. The classification is primarily linguistic, for the cultural patterns of Bantu speakers are extremely diverse; the linguistic connection, however, has given rise to considerable speculation concerning a possible common area of origin of the Bantu peoples, the linguistic evidence pointing strongly to the region of the present-day Cameroon–Nigeria border. It is generally agreed that some one-third of the continent today occupied by Bantu-speak-

ing peoples was, until approximately 2,000 years ago, the dominion of other groups. The causes and itinerary of the subsequent Bantu migration have been the focus of several anthropologists. George P. Murdock of the United States postulated that the expansion of the Bantu was associated with their acquisition of certain Malaysian food crops (banana, taro, and yam), which spread westward across the continent at about the time that the migration is thought to have begun. These crops, Murdock argued, enabled them to penetrate the tropical rain forest of equatorial Africa, from which they spread southward. A more widely held view, however, is that the migratory route lay eastward, across the southern Sudan, and then south, past the great lakes of the northeast.

Few generalities beyond this are useful. The economic, social, and political organization of the various Bantu-speaking peoples is extremely diverse, partly reflecting the wide range of habitats they occupy. Descent and kinship systems, religious practices, and political organization exhibit a similar diversity.

Banville, (Étienne-Claude-Jean-Baptiste-) Théodore (-Faulain) de (b. March 14, 1823, Moulins, Fr.—d. March 13, 1891, Paris), a respected French poet of the mid-19th century who was a late disciple of the Romantics, a leader of the Parnassian movement, and an influence on the Symbolists. His first

Banville
Popperfoto

book of verse, *Les Cariatides* (1842), owed much to the style and manner of Victor Hugo, but Banville rejected the poor craftsmanship of much French Romantic poetry. His *Petit Traité de poésie française* (1872) shows his interest in the technicalities of versification, of which he became a master. He considered rhyme to be the single most important element in French verse. Following the lead of the critic Charles Sainte-Beuve, who had revived interest in the sonnet, Banville experimented with various fixed forms that had been neglected since the mid-16th century—*e.g.*, the ballade and the rondeau. The chief quality of his poetry is its technical virtuosity, but contemporaries also admired its delicate wit and fantasy. His best known collection is *Les Odes funambulesques* (1857).

Banyak Islands, Bahasa Indonesia KEPULAUAN BANYAK, or BANJAK, group of more than 60 small islands, in Aceh *daerah istimewa* (special district), Indonesia. The largest of the islands are Great Banyak, or Pulau (island) Tuangku, and Pulau Bangkaru. With an area

of 123 square miles (319 square km), the group lies north of Pulau Nias and 18 miles (29 km) west of Sumatra in the Indian Ocean. The population is a mixture of settlers from northern and central Sumatra and from Nias; most are Muslims. Agriculture—rice and root crops—is largely for subsistence, but copra is exported. Pop. (1990) 4,102.

Banyamwesi (people): *see* Nyamwezi.

banyan (*Ficus benghalensis*, or *F. indica*), unusually shaped tree of the fig genus in the mul-

Banyan (*Ficus benghalensis*)

berry family (Moraceae) native to tropical Asia. Aerial roots that develop from its branches descend and take root in the soil to become new trunks. The banyan reaches a height up to 30 metres (100 feet) and spreads laterally indefinitely. One tree may in time assume the appearance of a very dense thicket as a result of the tangle of roots and trunks.

Banyoro (people): *see* Nyoro.

Banyuwangi, also spelled BANJUWANGI, or BANJOWANGI, city and *kabupaten* (regency), Jawa Timur *propinsi* (East Java province), Java, Indonesia. A major port on the Bali Strait opposite Bali just to the east, it is located about 120 miles (195 km) southeast of Surabaya, the capital of Jawa Timur. It is linked by railway and road with Jember to the west and by road with Situbondo to the northwest. Exports are copra, lumber, and rubber from the inland area. Industries include sawmilling, wood carving, paper making, leather tanning, and printing. The population is predominantly Javanese, and Islām, influenced by Hindu and Buddhist customs, is the dominant religion. About 50 miles (80 km) south of Banyuwangi is the Sukamedia beach and Meru Betiri, a national park that was the last refuge of the now-extinct Javan tiger. Baluran and Alas Purwo national parks are also located nearby. Pop. (1990) 89,877.

Banzart, also spelled BIZERTA, or BIZERTE, capital of Banzart *wilāyat* (governorate), northern Tunisia. The town, situated on the Mediterranean coast at the mouth of a channel from Buḥayrat (lake) Banzart, originated as a Phoenician outpost and was known through Carthaginian and Roman times as Hippo Diarrhytus or Hippo Zarytus. Captured in AD 661 by Ibn al-Hadaj, it was given the name Bizerte. It was occupied by the Spanish from 1535 to 1572 but later became a privateering stronghold. During the 1890s a canal (5,000 ft [1,500 m] long, 787 ft wide, and 32 ft deep) was built (completed in 1895) from Buḥayrat Banzart to the sea to open up the naval port and arsenal of Sidi Abdallah (now Manzil Bū Ruqaybah [Menzel-Bourguiba]). This canal altered the layout of Banzart, as a new town was built on the canal's outlet. The old town

Bantu tribesman of Kenya
Camera Press

(surrounded by an ancient wall) was on the mouth of the natural channel, which has since been filled in.

Banzart, which was an important military base during the French Protectorate (1881–1955), is now a seaport, beach resort, administrative centre, and regional market centre. Banzart was divested of its military function in 1963, but its port still exports fish, phosphates, iron ore, and cereals. Oil refining, which was begun in 1964, is its main industry; fish canning is of lesser importance. The town is linked by road and rail with Tūnis and Ṭabar-

Banzart (Bizerte), Tunisia, with its ancient wall

qah (Tabarka) and has an airport. Pop. (1994) town, 98,900.

Bánzer Suárez, Hugo, byname *EL PETISO* (Spanish: “The Short One”) (b. July 10, 1926, Santa Cruz, Bolivia—d. May 5, 2002, Santa Cruz), soldier, politician, and president of Bolivia from 1971 to 1978 and from 1997 to 2001.

Bánzer was educated at the Bolivian Army Military College and in two United States Army training schools. He served as minister of education from 1964 to 1966 in the cabinet of Pres. René Barrientos and as military attaché in Washington from 1967 until 1969, when he returned to Bolivia to head the Military College. In successive governmental changes between right- and left-wing officers, the conservative Bánzer helped Gen. Rogelio Miranda overthrow Pres. Alfredo Ovando in September 1970; Bánzer himself overthrew the leftist Gen. Juan José Torres on Aug. 22, 1971. Bánzer encouraged foreign investment, but his restrictive policies regarding union activity and constitutional liberties led to opposition from labour leaders, clergymen, peasants, and students. All opposition was severely repressed. In 1974 he survived two coup attempts and suppressed a peasant uprising.

Bánzer declined to run for president in the 1978 elections, which were won by Gen. Juan Pereda Asbún amid universal charges of vote fraud (50,000 more votes were cast than there were registered voters). Pereda himself requested a new election, but before it could take place, he staged a coup, forcing Bánzer to resign on July 21, 1978. Exiled by Pereda to Argentina, Bánzer returned in 1979 and founded the *Acción Democrática Nacionalista* (ADN; Nationalist Democratic Action), which became one of the country's most powerful parties.

Bánzer ran for president in 1985 and won in the popular vote but lost in the subsequent run-off vote in the country's Congress. He was successful in his bid for the presidency in 1997, but his administration struggled amid allegations of corruption and nepotism. Several general strikes were held, and there were calls for his resignation. Bánzer drew international praise, however, for significantly reducing Bolivia's cultivation of coca, a plant used to produce cocaine. In 2001 Bánzer resigned from office after being diagnosed with cancer.

Bao Dai, original name *NGUYEN VINH THUY* (b. Oct. 22, 1913, Vietnam—d. Aug. 1, 1997, Paris, France), the last reigning emperor of Vietnam (1926–45).

The son of Emperor Khai Dinh, a vassal of the French colonial regime, and a concubine of peasant ancestry, Nguyen Vinh Thuy was educated in France and spent little of his youth in his homeland. He succeeded to the throne in 1926 and assumed the title Bao Dai (“Keeper of Greatness”). He initially sought to reform and modernize Vietnam but was unable to win French cooperation.

During World War II the French colonial regime exercised a firm control over Bao Dai until the Japanese *coup de force* of March 1945, which swept away French administration in Indochina. The Japanese considered bringing back the aging Prince Cuong De from Japan to head a new quasi-independent Vietnamese state, but they finally allowed Bao Dai to remain as an essentially powerless ruler. When the Viet Minh seized power in their revolution of August 1945, Ho Chi Minh and his colleagues judged that there was symbolic value to be gained by having Bao Dai linked to them. The Viet Minh asked Bao Dai to resign and offered him an advisory role as “Citizen Prince Nguyen Vinh Thuy.” Finding that the Viet Minh accorded him no role, and distrustful of the French, Bao Dai fled to Hong Kong in 1946. There he led a largely frivolous life, making appeals against French rule.

In 1949 the French accepted the principle of an independent Vietnam but retained control of its defense and finance. Bao Dai agreed to return to Vietnam in these circumstances in May 1949, and in July he became temporary premier of a tenuously unified and nominally independent Vietnam. Reinstalled as sovereign, Bao Dai continued his pleasure-seeking ways and became generally known as the “Playboy Emperor.” He left the affairs of state to his various pro-French Vietnamese appointees, until October 1955 when a national referendum called for the country to become a republic. Bao Dai retired and returned to France to live.

baobab (*Adansonia digitata*), tree of the bombax family (Bombacaceae) of the order Malvales, native to Africa. The barrel-like trunk may reach a diameter of 9 metres (30 feet) and a height of 18 m. The large, gourdlike, woody fruit contains a tasty mucilaginous pulp. A strong fibre from the bark is used locally for rope and cloth. The trunks are often excavated to serve as water reserves or temporary shelters.

So extraordinarily shaped is the baobab that an Arabian legend has it that “the devil plucked up the baobab, thrust its branches into the earth, and left its roots in the air.” It is grown as a curiosity in areas of warm climate, such as Florida. A related species, *A. gregorii*, occurs in Australia, where it is called baobab or bottle tree (the latter name being

Baobab (*Adansonia digitata*)

B A Barlow

more correctly applied to the family Sterculiaceae).

Baoding (China): *see* Pao-ting.

Baol, in the 14th century, a satellite state of the Wolof empire of West Africa. Situated along the coast and inland to the south of Dakar in present Senegal, it was conquered some time after 1556 by the neighbouring state of Cayor, which controlled it until 1686. Late in the 17th century, Wolof invaded Cayor, causing many of its inhabitants to flee to Baol. The rulers of Baol were able to withstand European attempts at conquest until the French occupied their territory in the mid-19th century.

Baotou (China): *see* Pao-t'ou.

Bapedi (people): *see* Pedi.

Baptism, a sacrament of admission to the Christian Church. The forms and rituals of the various churches vary, but baptism almost invariably involves the use of water and the Trinitarian invocation, “I baptize you: In the name of the Father, and of the Son, and of the Holy Spirit.” The candidate may be wholly or partly immersed in water, the water may be poured over the head, or a few drops may be sprinkled or placed on the head.

Ritual immersion has traditionally played an important part in Judaism, as a symbol of purification (in the *mikvah*, a postmenstrual or ritual bath used by women) or as a symbol of consecration (in rituals of conversion, accompanied by special prayers). It was particularly significant in the rites of the Essenes. According to the Gospels, John the Baptist baptized Jesus. Although there is no actual account of the institution of baptism by Jesus, the Gospel According to Matthew portrays the risen Christ issuing the “Great Commission” to his followers: “Go therefore and make disciples of all nations, baptizing them in the name of the Father and of the Son and of the Holy Spirit, teaching them to observe all that I have commanded you” (Matt. 28:19–20). Elsewhere in the New Testament, however, this formula is not used. Some scholars thus doubt the accuracy of the quotation in Matthew and suggest that it reflects a tradition formed by a merging of the idea of spiritual baptism (as in Acts 1:5), early baptismal rites (as in Acts 8:16), and reports of Pentecostalism after such rites (as in Acts 19:5–6).

Baptism occupied a place of great importance in the Christian community of the 1st century, but Christian scholars disagree over whether it was to be regarded as essential to the new birth and to membership in the Kingdom of God or to be regarded only as an external sign

or symbol of inner regeneration. The Apostle Paul likened baptismal immersion to personal sharing in the death, burial, and Resurrection of Christ (Rom. 6:3-4). By the 2nd century, the irreducible minimum for a valid Baptism appears to have been the use of water and the invocation of the Trinity. Usually the candidate was immersed three times, but there are references to pouring as well.

Most of those baptized in the early church were converts from Greco-Roman paganism and therefore were adults. Both the New Testament and the Church Fathers of the 2nd century make it clear that the gift of salvation belongs to children, however. Tertullian seems to have been the first to object to infant Baptism, suggesting that by the 2nd century it was already a common practice. It remained the accepted method of receiving members in the Eastern and Western churches, except in the case of adult converts.

During the Reformation the Lutherans, Reformed, and Anglicans accepted the Catholic attitude toward infant Baptism. The radical Reformers, however, primarily the Anabaptists, insisted that a person must be sufficiently mature to make a profession of faith before receiving Baptism. In modern times the largest Christian groups that practice adult rather than infant Baptism are the Baptists and the Christian Church (Disciples of Christ).

Baptist, member of a group of Protestant Christians who share the basic beliefs of most Protestants but who hold as an article of faith that only believers should be baptized and that it must be done by immersion. The Baptists do not constitute a single church or denominational structure, but most of them adhere to a congregational form of church government.

A brief treatment of the Baptist movement follows. For full treatment, *see* MACROPAEDIA: Protestantism.

Two groups of Baptists emerged in England during the Puritan reform movement of the 17th century. While sharing the view that only believers should be baptized, the two groups differed with respect to the nature of Christ's atonement. Those who regarded the atonement as general (*i.e.*, for all persons) came to be called General Baptists. Those who interpreted it as applying only to the particular body of the elect acquired the name Particular Baptists.

The General Baptists trace their beginnings to the Baptist Church founded in London *c.* 1611 by Thomas Helwys and his followers. This group had returned to England from Amsterdam, where they had gone *c.* 1608 because of religious persecution of Separatists (those who wished to separate from the Anglican Church of England). While in Amsterdam, the group adopted the beliefs of their original leader John Smyth (Smith), who, by studying the New Testament, decided that only believers should be baptized. Through the work of the original London congregation, other General Baptist congregations were formed and the movement spread. In doctrine they were Arminians, believing in the general atonement; *i.e.*, that Christ's death was for all men and not only for the elect (those predestined to be saved). In the late 17th and 18th centuries, the General Baptists declined in numbers and influence. Churches closed and many members became Unitarians. The General Baptists were continued by a new group organized in 1770, the New Connection General Baptists, who had been influenced by the Methodist revival led by John Wesley.

Particular Baptists originated with a Baptist church established in 1638 by two groups who, in 1633 and 1638, left an Independent church (not part of the Church of England) in London. Members of the new church be-

lieved that only believers (not infants) should be baptized. In theology they were Calvinists, who held to the doctrine of a particular atonement, *i.e.*, that Christ died only for the elect.

The Particular Baptists grew more rapidly than the General Baptists, but growth subsequently slowed as the Particular Baptists emphasized their doctrine of salvation only for the elect and did not work to gain new members. After 1750, however, they were influenced by the Methodist movement, and new interests in evangelism and missions brought about renewed growth. Through the leadership of William Carey, the English Baptist Missionary Society was organized in 1792, and Carey went to India as the society's first missionary. Baptists were influential in the religious and political life of Great Britain during the 19th century, but their membership and influence declined after World War I.

The Baptist Union of Great Britain and Ireland was organized originally in 1813 by Particular Baptists. In 1891 the New Connection General Baptists merged into the Baptist Union. The strict Calvinism of the Particular Baptists had gradually been modified, and, although controversies occurred between conservatives and liberals, freedom of thought within denominational unity was generally acceptable to those in the Baptist Union.

Baptist origins in the United States can be traced to Roger Williams, who established a Baptist Church in Providence in 1639 after being banished by the Puritans from Massachusetts Bay. Williams soon abandoned his fold and leadership passed to John Clarke.

Though Rhode Island remained a Baptist stronghold, the centre of Baptist life in colonial America was Philadelphia. The first supra-congregational association was formed there in 1707, and the Philadelphia Baptist Association proceeded to sponsor new Baptist churches throughout the colonies.

Baptist growth was spurred by the Great Awakening of the mid-18th century. Increases were especially dramatic in the Southern colonies, where Shubael Stearns established a church at Sandy Creek, N.C., in 1755. From this centre revivalistic preachers fanned out across the southern frontier, establishing a Baptist dominance in the region which persists to the present. The membership of revivalistic Baptists continued to grow rapidly in the 19th century, assisted by lay preachers and a congregational church government well adapted to frontier settings.

Baptists in the United States were not united in a national body until 1814, when an increasing interest in foreign missions necessitated a more centralized organization. The General Convention was soon torn apart, however, by dissension over slavery. A formal split occurred in 1845 when the Southern Baptist Convention was organized in Augusta, Ga. and was confirmed when the Northern Baptist Convention was organized in 1907. Southern Baptists and Northern Baptists (later American Baptists) developed distinct regional characteristics following the Civil War and still exhibit different tendencies in theology, ecumenical involvement, missionary activity, and worship.

Black Baptist churches, now grouped primarily in two large conventions, constitute another major segment of Baptists in the United States. Organized by freed slaves after the Civil War, these churches have contributed enormously to the character of black life in America, often serving as the social and spiritual centre of the black community. Black Baptist churches and ministers, led by Martin Luther King, Jr., played a significant role in the Civil Rights Movement of the 1960s. These churches and ministers continued as vital elements of organization in black communities through the 1980s, as was evident in the presidential candidacies (1984, 1988) of the Reverend Jesse Jackson.

In the 20th century Baptists have experienced additional fragmentation, arising from theological controversy. There are now hundreds of independent Baptist churches, completely separated from all other bodies or loosely affiliated with other congregations in small, fundamentalist sects.

Through continuing missionary activity Baptists have established churches throughout the world. An important Baptist centre is Russia, where Baptists constitute the largest Protestant group.

Baptists maintain that authority in matters of faith and practice rests, under Christ, with the local congregation of baptized believers. These local congregations are linked voluntarily into state, regional, and national organizations for cooperative endeavors such as missions, education, and philanthropy. The larger organizations, however, have no control over the local churches. The separation of church and state has historically been a major tenet of Baptist doctrine.

Baptist worship is centred around the exposition of the scriptures in a sermon. Extemporaneous prayer and hymn-singing are also characteristic.

Early Baptists were characterized theologically by strong-to-moderate Calvinism, but this position was tempered considerably by the Evangelical revivals of the 18th and 19th centuries. Baptists in the 20th century have provided leadership for diverse theological movements, notably Walter Rauschenbusch in the Social Gospel movement, Harry Emerson Fosdick and Shailer Mathews in American Modernism, and Billy Graham in contemporary Evangelicalism. Baptists have generally been more concerned for religious experience and expression than precise theological formulations.

Baptist Federation of Canada, cooperative agency for several Canadian Baptist groups, organized in 1944 in Saint John, N.B., by the United Baptist Convention of the Maritime Provinces, the Baptist Convention of Ontario and Quebec, and the Baptist Union of Western Canada.

Baptist churches were organized in the Maritime Provinces in the latter half of the 18th century, primarily by Baptists who were loyal to England and who left New England because of the American Revolution. In 1846 the Baptist Convention of Nova Scotia, New Brunswick, and Prince Edward Island was organized. The name was changed in 1879 to the Baptist Convention of the Maritime Provinces. In 1905-06 this group and Free Baptists in New Brunswick and Nova Scotia merged to form the United Baptist Convention of the Maritime Provinces. In the 1960s it was renamed the United Baptist Convention of the Atlantic Provinces.

A few Baptist churches were organized in Ontario in the late 18th century, but, in the 19th century, many congregations were started in Ontario and Quebec by Baptists from the United States, England, and Scotland. The Ottawa Baptist Association, including churches in Quebec and eastern Ontario, was organized in 1836. Subsequently, other associations and mission societies were formed in these provinces, but various controversies delayed the union of these groups until 1888, when the Baptist Convention of Ontario and Quebec was organized.

Baptist missionaries from Ontario began working in western Canada in the 1870s, and congregations and associations were organized. In 1897 the Baptist Convention of British Columbia was established, and in 1909 the more inclusive Baptist Union of Western Canada was organized.

As early as 1900, efforts were made to unite the three Baptist conventions in Canada, but agreement could not be reached for many

years. The groups did cooperate, however, in home and foreign missions and in educational activities. From 1931 to 1943, an Inter-Conventions Committee worked out the details of union, which was completed in 1944. The federation acts as a coordinating agency and does not supplant the area conventions.

Baptist Missionary Association of America, association of independent, conservative Baptist churches, organized as the North American Baptist Association in Little Rock, Ark., in 1950, in protest against the American Baptist Association's policy of seating messengers at meetings who were not members of the churches that elected them. The present name was adopted in 1968. These churches cooperate in missions and have sent missionaries to several countries. An active publications department publishes Sunday school and other religious material, and a radio ministry produces programs that are heard in many places throughout the world.

The member churches of the Baptist Missionary Association of America are autonomous and share equally in the cooperative activities of the association. All the churches, however, must subscribe to a strict fundamentalist interpretation of Christian doctrine. They accept the statements of the Bible literally and expect the Second Coming of Christ. There is no cooperation or association with other groups who do not hold the same beliefs.

Baptist Union of Great Britain and Ireland, largest Baptist group in the British Isles, organized in 1891 as a union of the Particular Baptist and New Connection General Baptist associations. These groups were historically related to the first English Baptists, who originated in the 17th century.

The Baptist Union is a voluntary organization made up of area associations of churches, individual churches, colleges, and individual members. In the 20th century it has become more centrally organized. Its activities include education, ecumenical relations, missions, and social welfare, but it cannot interfere in the autonomy of the local churches. Headquarters are in London.

Baptist World Alliance (BWA), international advisory organization for Baptists, founded in 1905 in London. Its purpose is to promote fellowship and cooperation among all Baptists. It sponsors regional and international meetings for various groups for study and promotion of the gospel, and it works to safeguard religious liberty throughout the world.

World congresses of the BWA are held every five years; an executive committee meets annually. Headquarters are in Washington, D.C.

Baptiste, original name NICOLAS ANSELME (b. June 18, 1761, Bordeaux, France—d. Nov. 30/Dec. 1, 1835, Les Batignolles), one of the leading actors of sentimental comedy (*comédie larmoyante*) in France.

Baptiste, detail of a lithograph by F. Tomaszewicz
BBC Hulton Picture Library

After two provincial engagements, Baptiste went to Paris in 1791. In 1793 he joined the Théâtre de la République and in 1799 the Comédie-Française, from which he retired in 1828. He was not successful in tragedy. Parisians of the Napoleonic era primarily associated him with the noble fathers in such plays as Pierre-Augustin Caron de Beaumarchais's *Eugénie* (1767) and Denis Diderot's *Père de famille* (1758). His greatest achievement was in the title role of Philippe-Néricault Destouches's masterpiece *Glorieux*. Known as Baptiste the Elder, he was survived by his brother Paul-Eustache Anselme, called Baptiste the Younger, who had made a name for himself as a comedian.

baptistery, hall or chapel situated close to, or connected with, a church, in which the sacrament of baptism is administered. The form of the baptistery originally evolved from small, circular Roman buildings that were designated for religious purposes (e.g., the Temple of Venus, Baalbek, Lebanon, AD 273, and the Mausoleum of Diocletian, Spalato [Split, Croatia], AD 300); but because baptism originally was performed on only three holidays, Easter, Pentecost, and Epiphany, enlargement

Battistero (baptistery) San Giovanni, Florence, begun 7th century
Alinari—Art Resource

of the older Roman buildings became necessary to accommodate the growing numbers of converts.

Baptisteries were among the most symbolic of all Christian architectural forms; and the characteristic design that was developed by the 4th century AD can be seen today in what is probably the earliest extant example, the baptistery of the Lateran palace in Rome, built by Sixtus III, pope between 432 and 440.

The baptistery was commonly octagonal in plan, a visual metaphor for the number eight, which symbolized in Christian numerology a new beginning. As eight follows the "complete" number, seven, so the beginning of the Christian life follows baptism. Customarily, a baptistery was roofed with a dome, the symbol of the heavenly realm toward which the Christian progresses after the first step of baptism. The baptismal font was usually octagonal, set beneath a domical ciborium, or canopy, and encircled by columns and an ambulatory—features that were first used in the baptistery by the Byzantines when they altered Roman structures.

Baptisteries commonly adjoined the atrium, or forecourt, of the church and were often large and richly decorated, such as those at Pisa, Florence, Parma, and Nocera in Italy; el Kantara, Alg.; and Poitiers, France. After the 6th century they were gradually reduced to the status of small chapels inside churches. In the 10th century, when baptism by affusion (pouring liquid over the head) became standard practice in the church, baptisteries,

or baptismal chapels, were often omitted entirely.

In most modern churches the font alone serves for baptism; something of earlier symbolism survives, however, in its usual location near the church door—an allusion to entering the Christian life.

Bâqî (Turkish poet): see Bâkî.

Baqqārah, also spelled BAGGARA (Arabic: "Cattlemen"), nomad Arabs who have been forced by circumstance to live in a part of Africa that will support the cow but not the camel—south of latitude 13° and north of latitude 10° from Lake Chad eastward to the Nile River. Probably they are the descendants of Arabs who migrated west out of Egypt in the European Middle Ages, turned south from Tunisia to Chad, and finally moved back eastward in the 18th or 19th century to settle below the now Islāmized sultanates of Kordofan, Darfur, and Wadai.

Herding cattle is the Baqqārah livelihood, requiring them to migrate south to the river lands in the dry season and north to the grasslands during the rains. During these seasonal treks, crops such as sorghum and millet as well as indigenous Sudanic crops are grown.

Association with local peoples such as the Fulani have given the Baqqārah a distinct dialect of Arabic.

Ba'qūbah, town, east-central Iraq. Located on the Diyālā River and on a road and a rail line between Baghdad and Iran, it is a regional trade centre for agricultural produce and livestock. The name comes from the Aramaic *Bāya 'qūbā*, meaning "Jacob's house." The town is located on the site of a settlement dating back to pre-Islāmic times. Under the 'Abbāsid caliphate, it was a prosperous town known for its date and fruit orchards, and the surrounding country was populous and fertile with many villages. It was an important stop on the Baghdad-Khorasan road, part of the silk and spice route. Many Assyrian Christian refugees fled there during World War I. Pop. (latest est.) 115,000.

Bar, port in Montenegro, Serbia and Montenegro, on the Adriatic Sea. It is the country's principal port and the only maritime outlet for the landlocked republic of Serbia. The current city is known as Novi ("New") Bar. Stari ("Old") Bar's ruins lie farther inland at the base of Mount Rumija. Stari Bar was first mentioned in the 9th century, when it came under the control of the Byzantine Empire. Known among Mediterranean powers as Antivari, the city was frequently autonomous from the 11th to the 15th century. During the 14th century its archbishop acquired the title primate of Serbia. It was ruled from Venice (1443–1571) and then by the Turks (1571–1878). Partly ruined in 1878 when the Montenegrins wrested it from the Turks, it was abandoned after gunpowder explosions in 1881 and 1912. The new town, which is now a major port and recreation centre connected with Belgrade by rail, has been greatly enlarged since the late 1970s to facilitate increased oil imports and exports. To the southeast is the port of Ulcinj, a tourist and health resort, while inland is Lake Scutari, the largest lake in the Balkans. Pop. (2003) 45,223.

BAR (U.S. rifle): see Browning automatic rifle.

Bar, Confederation of, Polish BARSKA KONFEDERACJA (1768–72), league of Polish nobles and gentry that was formed to defend the privileges of the Roman Catholic church and the independence of Poland from Russian encroachment. Its activities precipitated a civil war, foreign intervention, and the First Partition of Poland.

In February 1768, Russia had compelled the Polish Sejm (legislature) to abandon projects for internal reform, to grant full political rights to religious dissenters (*i.e.*, members of the Protestant and Orthodox faiths), and to make Poland a Russian protectorate. In reaction, Adam Krasiński, the bishop of Kamieniec, Józef Pulaski, and Michal Krasiński organized a confederation at the little fortress of Bar in Podolia (Feb. 29, 1768) to oppose both the Polish king Stanislaw II August Poniatowski and Russia.

Forced by the king's army to abandon Bar, the confederates were generally checked in Poland's southeastern provinces (summer 1768) by Russian troops, who had been occupying Warsaw during the Sejm's session. Nevertheless, uprisings occurred in support of the confederation in all of Poland's major cities; and under the military leadership of Ignacy Malczewski, Prince Karol Radziwill, and Kazimierz Pulaski, the confederates spread their rebellion throughout the country and gained the support of the Turks (who declared war on Russia on Oct. 8, 1768) and of the French (who sent advisers and some troops to the confederates). The confederates proclaimed the dethronement of Stanislaw (Oct. 22, 1770) and refused to surrender to the Russians, whose continued military victories culminated in General Aleksandr Vasilyevich Suvorov's triumph over the confederate army near Lanckorona (May 1771).

Although the Confederation of Bar stubbornly pursued its struggle until its last contingent was defeated at Częstochowa (Aug. 18, 1772), it failed to overthrow Stanislaw or to end Russian domination over Polish affairs. Furthermore, its campaigns so devastated the country and weakened the government that Poland was defenseless when Prussia, and eventually Austria, agreed (Feb. 17 and Aug. 5, 1772) to partition Poland, which was compelled to cede almost one-third of its territory to the three partitioning powers.

Bar, François de (b. 1538, Seizencourt, near Saint-Quentin, France—d. March 25, 1606, Abbey of Anchin, near Pecquencourt), French historiographer and scholar of ecclesiastical law, whose church histories are considered the most detailed and complete of his time.

Named prior of the Benedictine abbey of Anchin in 1576, Bar served during a time of religious and political power struggles. His main contribution, however, was the compilation of extensive documents on church history and law from the valuable library of the abbey. In addition to his historical and legal works, he cataloged and annotated many of the manuscripts in the Anchin library and wrote treatises on geography, cosmography, and church practices.

bar association, also called LEGAL ASSOCIATION, group of attorneys, whether local, national, or international, that is organized primarily to deal with issues affecting the legal profession. In general, bar associations are concerned with furthering the best interests of lawyers. This may mean the advocacy of reforms in the legal system, the sponsoring of research projects, or the actual regulation of professional standards.

Bar associations sometimes administer the examinations that are required for admission to practice law, and they may supervise necessary apprenticeship programs. Their membership requirements vary from country to country. In the United States, for example, law school graduates are admitted to a state bar association immediately after they pass a series of examinations, which are usually administered by examiners appointed by state courts; in Austria, on the other hand, it is necessary for a lawyer to have seven years' legal

experience in order to be a member. Membership in the bar associations of many countries is often compulsory. In Japan, Nigeria, Israel, and France and in more than half the states of the United States, for example, membership is required of all lawyers. On the other hand, in England, Norway, and Sweden, membership in such bar associations is voluntary.

Many bar associations have disciplinary powers over their members, but actual procedures for disbarment (*q.v.*), relieving an attorney of his license to practice, are usually carried on in court. In France, for example, the major responsibility for disciplining attorneys belongs to the Cour de Cassation.

There are many international associations of lawyers, the most prominent being the International Bar Association, a voluntary group of national bar associations and some individual lawyers, which is dedicated, among other things, to achieving uniformity in certain areas of law.

Bar Cochba: *see* Bar Kokhba.

bar code, a printed series of parallel bars or lines of varying width that is used for entering data into a computer system. The bars are typically black on a white background, and their width and quantity vary according to application. The bars are used to represent the binary digits 0 and 1, sequences of which in turn can represent numbers from 0 to 9 and be processed by a digital computer. The presence or absence of a bar of a particular width in a particular position in a sequence is read by the computer as either a 0 or 1. Most such codes use bars of only two different widths (thick and thin), though some codes employ four widths. The numbers represented by a bar code are also printed out at its base.

Bar code (Universal Product Code)

Bar code information is read by an optical (laser) scanner that is part of a computer system. A handheld scanner or bar code pen is moved across the code, or the code itself is moved by hand across a scanner built into a checkout counter or other surface. The computer then stores or immediately processes the data in the bar code. The bar codes printed on supermarket and other retail merchandise in the United States are those of the Universal Product Code, or UPC, which assigns each type of food or grocery product a unique code. In the UPC system, the five digits on the left are assigned to a particular manufacturer or maker, and the five digits on the right are used by that manufacturer to identify a specific type or make of product. This is usually the only information contained in a bar code.

Bar coding was introduced in the 1970s and is now a ubiquitous part of routine commercial transactions. Grocery stores use the codes to obtain price and other data about goods at the point of purchase by the consumer. At a typical supermarket checkout counter, a scanner is used to identify a product through its bar code, and a computer then looks up the item's price and feeds that number into the cash register, where it becomes part of the bill for the customer's purchases.

The chief advantage of bar code systems is that they allow users to process detailed information at the moment the bar code is

scanned, rather than simply storing information for later processing. For example, ski resorts can affix the codes to skiers and scan the bars when skiers enter ski lifts, thereby allowing the resort to monitor patterns of slope use. Various bar code systems are now used to track a vast range of products as they are manufactured, distributed, stored, sold, and serviced. These products range from processed foods and dry goods to drugs and medical supplies, automotive parts, computer parts, and even library books.

Bar form, in music, the structural pattern *aab* as used by the medieval German minnesingers and meistersingers, who were poet-composers of secular monophonic songs (*i.e.*, those having a single line of melody). The modern term *Bar form* derives from a medieval verse form, the *Bar*, consisting of three stanzas, each having the form *aab*. The musical term thus refers to the melody of a single stanza, the *a* sections (called *Stollen*) having the same melody, and the *b* section (*Abgesang*) having a different melody.

The *Bar form* had important precedents in some Gregorian chants, in the *canso* of the Provençal-speaking troubadours, and in the ballade of the *trouvères* (their French-speaking counterparts). It was eagerly embraced by the meistersingers, bourgeois successors to the courtly minnesingers, and even exerted an influence on the structure of 15th- and early 16th-century German part-songs. In the 19th century Richard Wagner revived the *Bar form* in his neo-medieval music dramas (*e.g.*, *Tannhäuser* and *Die Meistersinger*), causing Alfred Lorentz in the early part of the 20th century to speculate that it concealed the "secret" of Wagner's monumental structures at virtually every level.

Bar Harbor, coastal town, Hancock county, southern Maine, U.S. It is on Mount Desert Island, at the foot of Cadillac Mountain (1,532 feet [467 m]) facing Frenchman Bay, 46 miles (74 km) southeast of Bangor. Settled in 1763, it was incorporated in 1796 as Eden; the present name (for Bar Island in the main harbour) was adopted in 1918. Most of the town was destroyed by fire in 1947. Rebuilt Bar Harbor is the centre of a popular resort area verging on Acadia National Park and is a port of entry. It is linked to the mainland by bridge and is the terminus for the ferry service to and from Yarmouth, Nova Scotia. The College of the Atlantic opened there in 1969. The Jackson Laboratory for biological research is nearby. Pop. (1990) 4,443.

Bar Hebraeus, Arabic IBN AL-'IBRI ("Son of the Hebrew"), or ABU AL-FARAJ, Latin name GREGORIUS (b. 1226, Melitene, Armenia [now Malatya, Turkey]—d. July 30, 1286, Marāgheh, Iran), medieval Syrian scholar noted for his encyclopaedic learning in science and philosophy and for his enrichment of Syriac literature by the introduction of Arabic culture.

Motivated toward scholarly pursuits by his father, a Jewish convert to Christianity, Bar Hebraeus emigrated to Antioch (now Antakya, Turkey) and at the age of 17 became a hermit. He was made a bishop at 20 and an archbishop at 26, and by 1264 he was assistant patriarch (chief prelate) of the Eastern Jacobite church, a group named after its founder, Jacob Baradaeus. The Jacobites were monophysite schismatics.

Bar Hebraeus' travels to libraries throughout Syria and Armenia enabled him to compile collections of classical Arabic texts in philosophy and theology, which he transmitted to posterity through his own copies, condensations, and Syriac translations. He himself wrote treatises on grammar, astronomy, mathematics, medicine, philosophy, theology, and history, thereby reinvigorating the Syriac language and making Islāmic learning accessible

to his fellow Jacobites. Among his chief works was an encyclopaedia of philosophy, *He'wath hekkimthā* ("The Butter of Wisdom"), in which he commented on every branch of human knowledge in the Aristotelian tradition. Another was his *Chronography*, consisting of a secular history from the time of creation and an ecclesiastical history of the patriarchate of Antioch and the Eastern Jacobite church.

Bar Hebraeus' scholarship and political tact significantly enhanced the cultural exchange between the Christian and Muslim worlds. In the midst of 13th-century Muslim rule, he followed a conciliatory policy, seeking tolerance from the Arabs, whom he served as physician, and promoting rapport among disputing Christian groups.

Bar Kokhba, original name SIMEON BAR KOSBA, Kosba also spelled KOSEBA, KOSIBA, or KOCHBA, also called BAR KOZIBA (d. AD 135), Jewish leader who led a bitter but unsuccessful revolt (AD 132–135) against Roman dominion in Palestine.

During his tour of the Eastern Empire in 131, the Roman emperor Hadrian decided upon a policy of Hellenization to integrate the Jews into the empire. Circumcision was proscribed, a Roman colony (Aelia) was founded in Jerusalem, and a temple to Jupiter Capitolinus was erected over the ruins of the Jewish Temple.

Enraged by these measures, the Jews rebelled in 132, the dominant and irascible figure of Simeon bar Kosba at their head. Reputedly of Davidic descent, he was hailed as the Messiah by the greatest rabbi of the time, Akiva ben Yosef, who also gave him the title Bar Kokhba ("Son of the Star"), a messianic allusion. Bar Kokhba took the title *nasi* ("prince") and struck his own coins, with the legend "Year I of the liberty of Jerusalem."

The Roman historian Dion Cassius noted that the Christian sect refused to join the revolt. The Jews took Aelia by storm and badly mauled the Romans' Egyptian Legion, XXII Deiotariana. The war became so serious that in the summer of 134 Hadrian himself came from Rome to visit the battlefield and summoned the governor of Britain, Gaius Julius Severus, to his aid with 35,000 men of the Xth Legion. Jerusalem was retaken, and Severus gradually wore down and constricted the rebels' area of operation, until in 135 Bar Kokhba was himself killed at Betar, his stronghold in southwest Jerusalem. The remnant of the Jewish army was soon crushed; Jewish war casualties are recorded as numbering 580,000, not including those who died of hunger and disease. Judaea was desolated, the remnant of the Jewish population annihilated or exiled, and Jerusalem barred to Jews thereafter. But the victory had cost Hadrian dear, and in his report to the Roman Senate on his return, he omitted the customary salutation "I and the Army are well" and refused a triumphal entry.

Bar Kokhba was derided by some as "Bar Koziba" (a pun on the Hebrew word for liar). In 1952 and 1960–61 a number of Bar Kokhba's letters to his lieutenants were discovered in the Judaean desert.

Bar-le-Duc, capital of Meuse *département*, Lorraine *région*, northeastern France. It extends out along the narrow valley of the Ornain River, west of Nancy. To the northeast is the Canal de la Marne au Rhin, on the southwest the Canal des Usines. The Ornain River valley is enclosed by wooded and vine-clad hills. From the 10th century Bar was the seat of a countship, and later a duchy. The remains of the château of the counts and dukes of Bar are in the upper town, along with the 15th–16th-century Church of Saint-Étienne and medieval houses. The Church of Notre-Dame (15th century) and the buildings housing municipal offices are in the lower town. In 1960 an industrial zone was set up to the

east of the town. There is now some heavy industry and textile manufacture, although not enough to sustain any major growth of population. Pop. (1990) 18,577.

Bar Mitzvah, also spelled BAR MITZVA, or MITZWA (Hebrew: "Son of the Commandment"), plural BAR MITZVAHS, BAR MITZVOT, or BAR MITZWOT, Jewish religious ritual and family celebration commemorating the religious adulthood of a boy on his 13th birthday. The boy, now deemed personally responsible for fulfilling all the commandments, may henceforth don phylacteries (religious symbols worn on the forehead and left arm) during the weekday-morning prayers and may be counted an adult whenever 10 male adults are needed to form a quorum (*minyān*) for public prayers.

In a public act of acknowledging religious majority, the boy is called up during the religious service to read from the Torah. This event may take place on any occasion following the 13th birthday at which the Torah is read but generally occurs on the sabbath. The liturgy of the day thus permits the boy to read the weekly text from the prophets, called *Haftarah*. This is sometimes followed by a hortatory discourse. After the religious ceremony, there is often a festive Kiddush, or prayer over a cup of wine, with a family social dinner or banquet on the same or the following day.

Though records of the 2nd century mention 13 as the age of religious manhood, most elements of the Bar Mitzvah celebration did not appear until the European Middle Ages. Reform Judaism replaced Bar Mitzvah, after 1810, with the confirmation of boys and girls together, generally on the feast of Shavuot. In the 20th century, however, many Reform congregations restored Bar Mitzvah, delaying confirmation until the age of 15 or 16. Numerous Conservative and Reform congregations have instituted a separate ceremony to mark the adulthood of girls, called Bat Mitzvah.

Bar-Salibi, Jacob, also called DIONYSIUS BAR-SALIBI (d. Nov. 2, 1171), the great spokesman of the Jacobite (monophysite) church in the 12th century.

A native of Melitene (now Malatya, Turkey), Bar-Salibi was made bishop of Marash in 1154 and, a year later, of Mabbog as well. In 1166 he was transferred to the metropolitan see of Amid (Diyarbakır), where he remained until his death. His works include poems, prayers, homilies, liturgies, a commentary on the six *Centuries* of Evagrius with the text translated into Syriac, a treatise against heresies, expositions of the Syrian Eucharistic service and doctrine, and commentaries on the Old and New Testaments. The Old Testament commentary, a compilation rather than an original composition, gives a material or literal exposition and a spiritual or mystical exposition. The New Testament commentary, less developed except on the Gospels, also deals with the text on two levels.

bar Sauma, Rabban (b. c. 1220, Chung-tu [now Peking], China—d. January 1294, Baghdad, Iraq), Nestorian Christian ecclesiastic whose important but little-known travels in western Europe as an envoy of the Mongols provide a counterpart to those of his contemporary, the Venetian Marco Polo, in Asia.

Born into a wealthy Christian family living in Chung-tu and descended from the nomadic Uighurs of Turkistan, bar Sauma became a Nestorian monk at the age of 23, gaining fame as an ascetic and teacher. With his disciple Marcus he attempted a pilgrimage to Jerusalem, passing through Kansu and Khotan (Ho-t'ien) in western China, Khorāsān in Iran, and Azerbaijan before reaching Baghdad, the residence of the catholicus, or head, of the Nestorian church. Unable to reach Jerusalem because of local fighting, he stayed some time

in Nestorian monasteries in Armenia before being called back to Baghdad by the catholicus to head a mission to Abagha, the Mongol Il-khan ("regional khan") of Iran. Later he was appointed visitor general of the Nestorian congregations of the East, a post similar to that of archdeacon.

In 1287 bar Sauma was sent on a mission to the Christian monarchs of western Europe by Abagha's son Arghūn, a religious eclectic and Christian sympathizer who hoped to persuade the Christian kings to join him in expelling the Muslims from the Holy Land. Traveling to Constantinople, bar Sauma was received hospitably by the Byzantine emperor Andronicus II Palaeologus, but on reaching Rome he learned that Pope Honorius IV had just died. He was interviewed by the Sacred College of Cardinals, who, less interested in his mission than in his theological tenets, asked him to recite the Nestorian creed. Reluctant to do so, as Nestorianism was considered a heresy in the West, he left Rome and traveled to Paris, staying a month at the court of King Philip IV, and to Bordeaux, where he met Edward I of England. Neither monarch was willing to commit to an alliance with Arghūn.

Leaving France, bar Sauma passed back through Rome and met the newly elected pope, Nicholas IV, before returning to Iran. Later he was appointed chaplain to the Il-khan's court and still later retired to Marāgheh in Azerbaijan to found a church. A perceptive traveler, he kept a diary in Persian that gives an unusual outsider's view of medieval Europe. An English translation is included in Sir Wallis Budge's *Monks of Kublai Khān*.

Bara, also called IBARA, Malagasy people who live in south-central Madagascar and speak a dialect of Malagasy, a West Austronesian language.

Traditionally a bellicose people, the Bara lived in a great many independent groups based on lineage identity. Five main kinship groups exist, and formerly the Bara had two kingdoms, one of which survived until it was disbanded by the French. The Bara were never conquered by or assimilated into the central Merina kingdom, and when the French occupied Madagascar in 1895, they had difficulty uniting the Bara into administrative entities.

Chiefs of Bara clans are of Indian ancestry and were thus related to the nobles of the Sakalava and Betsileo peoples. Like most Malagasy, Bara were traditionally socially stratified into three tiers, but the French dissolved the old "feudal" organization, and little of it exists in modern Madagascar.

The Bara are primarily seminomadic cattle herders in the savanna country of their native Tulear and Fianarantsoa provinces. They have slowly begun settled agricultural practices, however, growing rice, cassava, millet, and corn (maize).

Bara, Theda, original name THEODOSIA GOODMAN (b. July 20, 1890, Cincinnati, Ohio, U.S.—d. April 7, 1955, Los Angeles, Calif.), American silent-film star who was the first screen vamp who lured men to destruction. Her films set the vogue for sophisticated sexual themes in motion pictures and made her an international symbol of daring new freedom.

A brief stage career under the name Theodosia de Coppet preceded her going to Hollywood as a film extra. *A Fool There Was* (1915), her first important picture, was released with an intense publicity campaign that

made her an overnight success. She was billed as the daughter of an Eastern potentate, her name an anagram for "Arab Death."

Theda Bara made more than 40 motion pictures within three years, mostly costume spectacles in which she played an irresistible, heartless woman who lived only for sensual pleasure. Among these films were *Romeo and Juliet* (1916), *Under Two Flags* (1916),

Theda Bara in the film *Cleopatra*

Camille (1917), *DuBarry* (1917), *Cleopatra* (1917), *Salome* (1918), and *Kathleen Mavourneen* (1919). By the end of World War I, her popularity had declined. She retired from the screen in the late 1920s.

Bāra Banki, town, east-central Uttar Pradesh state, northern India. It lies northeast of Lucknow and includes the larger town of Nawābganj. Nawābganj is an agricultural market and cotton-weaving centre. The two towns are on a main road between Lucknow and Faizābād and on two railways. Rice, gram (chick-peas), and wheat are the most important crops grown in the locality. Pop. (1991) town, 12,301; metropolitan area, 77,234.

Baraboo, city, seat (1847) of Sauk county, south-central Wisconsin, U.S. It lies in a hilly region on the Baraboo River about 35 miles (55 km) northwest of Madison. Ho-Chunk (Winnebago), Fox, Sauk, and Kickapoo Indians were early inhabitants of the area. Baraboo originated in the early 19th century as a trading post established by the French trapper Jean Baribault, who lived along the river that was named for him. The community developed as a lumbering centre and later as a distribution centre for dairy and agricultural goods produced in the surrounding area.

Baraboo is best known, however, as the original home of the five Ringling (Rüngeling) brothers and the birthplace in 1884 of the Ringling Bros. Circus. The city's Circus World Museum occupies 50 acres (20 hectares). A University of Wisconsin college opened in Baraboo in 1968. Devil's Lake State Park, 3 miles (5 km) south, contains historic Indian effigy mounds. Inc. 1882. Pop. (2000) 10,711.

Baracaldo, also spelled BARAKALDO, industrial municipality, northern Biscay (Vizcaya) *provincia*, in the autonomous Basque Country, northeastern Spain. It lies on the south bank of the Nervión River. Baracaldo consists of the Bilbao suburbs of El Regato, San Vicente de Baracaldo, Iráuregui, and Alonsótegui. It is the terminus of a mining railway; the locality's primary economic activities include iron refining and the manufacture of steel tubing, machinery, and shipbuilding equipment. Baracaldo is one of the leading iron and steel centres of Spain. Pop. (1991 prelim.) 104,883.

Baracoa, port city, Guantánamo *provincia*, eastern Cuba. It is situated on the extreme eastern part of the island, along a small semi-circular bay on the north coast. Surrounded by rugged mountains, Baracoa was isolated from the rest of Cuba until the 1960s.

In December 1492 Christopher Columbus stopped at what is now Baracoa, and when the conquistador Diego Velázquez de Cuéllar colonized Cuba, he established the island's first Spanish settlement at Baracoa in 1512. The town was Cuba's capital from 1518 to 1522. Cacao, coconuts, and bananas are grown in the surrounding area and are exported from the port. Pop. (1981) city, 35,754; (1986 est.) mun., 78,300.

Baradā, Greek CHRYSORRHOAS, river of western Syria. It rises in the Anti-Lebanon Mountains and flows southward for 52 miles (84 km) through Damascus to intermittent Lake Al-Utaybah and its marshes. The Baradā sets out peacefully on its course only to become within 20 miles a raging torrent, its volume almost doubled by the Fijah Spring (this spring has been tapped to bring drinking water to Damascus). Without human intervention, the Baradā would have cut a deep bed through the Damascus Depression, wasting most of its water. Throughout history humans have cut channels at different levels parallel to the main branch of the river to divert its flow. The channels, of Nabataean, Aramaean, and especially Roman origin, fan out as they reach the edge of Damascus, irrigating an area of about 145 square miles (375 square km). This system, kept in repair over time, has created the Ghūṭah Oasis (the site of Damascus), an artificial oasis of extreme fertility in what would otherwise have been an arid place.

barae (Shintō rite): *see* harai.

Barāhanagar (India): *see* Baranagar.

Barahona, in full SANTA CRUZ DE BARAHONA, city, southwestern Dominican Republic. It lies along Neiba Bay, off the Caribbean Sea, at the northeastern foot of the Sierra de Bahoruco. The gateway to the Dominican Republic's lake district, Barahona is an important port and fishing centre. Sugarcane is grown in the surrounding alluvial lowlands, coffee in the mountains. The city's industrial and commercial activity centres on sugar; sugarcane, molasses, coffee, hardwoods, and fruits are the main exports. Salt beds are located in the area. Pop. (1983 est.) 51,000.

barai (Shintō rite): *see* harai.

Baraita, also spelled BARAITHA (Hebrew: "Outside Teaching," or "Exclusion"), plural BARAITOT, BARAITOTH, or BARAITHOTH, any of the ancient oral traditions of Jewish religious law that were not included in the Mishna (the first authoritative codification of such laws). The Baraitot that are found dispersed singly throughout the Palestinian and Babylonian Talmuds are often recognizable by such introductory words as "it was taught" or "the rabbi taught." Other Baraitot are found in independent collections, the best known of which is called Tosefta; in form and content it parallels the Mishna. Halakhic Midrashim (interpretations and commentaries on Oral Law) are another source of Baraitot. Since the Mishna was selective and concisely phrased, Baraitot preserved oral traditions of Jewish law that might otherwise have been lost.

Barāk River (India): *see* Surma River.

Baraka, Amiri, also called IMAMU AMIRI BARAKA, original name in full (until 1968) (EVERETT) LEROI JONES (b. Oct. 7, 1934, Newark, N.J., U.S.), writer who presented the experiences and anger of black Americans with an affirmation of black life.

Jones graduated from Howard University (B.A., 1953) and served in the U.S. Air Force. After military duty, he joined the Beat move-

ment (*q.v.*), attended graduate school, and published his first major collection of poetry, *Preface to a Twenty Volume Suicide Note*, in 1961. In 1964 his play *Dutchman* appeared off-Broadway to critical acclaim. In its depiction of an encounter between a white woman and a black intellectual, it exposes the suppressed anger and hostility of American blacks toward the dominant white culture. After the assassination of Malcolm X, Jones took the name Amiri Baraka and began to espouse black nationalism.

In 1965 he founded the Black Arts Repertory Theatre in Harlem. He published much during this period, including *Black Art* (1966) and *Black Magic* (1969). In addition to poetry and drama, Baraka wrote several collections of essays, an autobiographical novel (*The System of Dante's Hell* [1965]), and short stories. In the mid-1970s he became a Marxist, though his goals remained similar. "I [still] see art as a weapon and a weapon of revolution," he said. "It's just now that I define revolution in Marxist terms." In addition to writing, Baraka taught at several American universities. *The Autobiography of LeRoi Jones/Amiri Baraka* was published in 1984.

Barak, Ehud, original name EHUD BROG (b. Feb. 12, 1942, Mishmar HaSharon kibbutz, Palestine [now northern Israel]), soldier and politician who was prime minister of Israel from 1999 to 2001.

Barak was born in a kibbutz that had been founded in 1932 by his father, an emigrant from Lithuania. In 1959 he was drafted into the Israel Defense Forces, where he began a distinguished military career (and changed his name). A commander in the Six-Day War (1967) and the Yom Kippur War (1973), Barak became especially known as the leader of special forces units that conducted commando raids. When he retired in 1995 as a lieutenant general, the army's highest rank, he was the most decorated soldier in Israeli history.

Barak had received a B.Sc. degree (1968) from Hebrew University of Jerusalem and an M.Sc. degree (1978) from Stanford University in California. He turned his attention to politics in the mid-1990s and was elected to the Knesset (Israeli parliament) in 1996. The next year he became head of the Labour Party and two years later ran for prime minister under the One Israel coalition. In a face-off with the incumbent Benjamin Netanyahu, Barak won more than 56 percent of the popular vote.

As prime minister, Barak reactivated peace talks with Palestinian leader Yāsir 'Arafāt. The two men signed a deal that called for the creation of a final peace accord by September 2000 as well as the transfer of more Israeli-occupied territory in the West Bank to Palestinian control. Barak also resumed peace talks with Syria and ended Israel's 17-year occupation of southern Lebanon.

In the summer of 2000, however, Barak's coalition collapsed, leaving him with a minority government, but he narrowly won a vote of confidence in the Knesset. In September violence erupted in the West Bank and Gaza. A meeting between Barak and 'Arafāt resulted in a cease-fire agreement that was all but ignored. As fighting continued, Barak announced a time-out from peacemaking, and in December 2000 he resigned as prime minister. In his bid for reelection, he was defeated by Ariel Sharon and resigned from the Labour Party leadership and membership in the Knesset.

Bārakzay DYNASTY, ruling family in Afghanistan in the 19th and 20th centuries. The Bārakzay brothers seized control of Afghanistan and in 1826 divided the region between them. Dōst Moḥammad Khān gained preeminence and founded the dynasty about 1837. Thereafter his descendants ruled in direct succession until 1929, when the reigning monarch abdicated and his cousin Moḥammad Nāder Khān was elected king.

Nāder Khān, on his assassination in 1933, was succeeded by his son Zahir Shah, who reigned until July 17, 1973, when he was deposed and a republic was proclaimed. The Bārakzay rulers, in chronological order, were Dōst Moḥammad Khān, Shīr 'Alī Khān, Ya'qūb Khān, 'Abdor Raḥmān Khān, Ḥabībollāh Khān, 'Amānollāh Khān, Moḥammad Nāder Khān, and Moḥammad Zahir Shah.

Baram River, river in northwestern Borneo. Rising in the Iran Mountains, it flows 250 miles (400 km) west and northwest, mostly through primary rain forest to the South China Sea at Baram Point. Above the lowest 100 miles, gorges and rapids make upstream navigation difficult. The Baram is Sarawak's second longest river; its tributaries include the Bakong, Apoh, Palutan, and Patah.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Bāramūla, town in the northwestern part of the Indian-held sector of Jammu and Kashmir state, in the northern part of the Indian subcontinent. It is situated on the Jhelum River about 7 miles (11 km) beyond the river's emergence from Wular Lake. Located some 28 miles (45 km) west and slightly north of Srinagar, the capital of the Indian-held sector of Jammu and Kashmir, Bāramūla is surrounded by an agricultural region in which rice, wheat, and barley are grown. The region is bordered by the Pir Panjāl Range of the Himalayas (west) and the Vale of Kashmir (east). Pop. (1981) 33,945.

Baranagar, also spelled BARĀHANAGAR, town, southeastern West Bengal state, north-eastern India, just east of the Hooghly River, part of the Calcutta urban agglomeration. Originally a Portuguese settlement, it became the seat of a Dutch trading station and an important river anchorage for Dutch shipping; in 1795 it was ceded to the British. Constituted as the municipality of North Suburban in 1869, the town was renamed Baranagar in 1889. In 1899 it was divided, the northern half becoming Kāmārhāti municipality. Connected by road and rail with Calcutta, it is a major industrial centre engaged in jute and cotton milling, cotton ginning and baling, and the manufacture of chemicals, castor oil, matches, and agricultural and industrial machinery. Pop. (1991) 224,821.

Baranauskas, Antanas (b. Jan. 17, 1835, Anykščiai, Lithuania, Russian Empire—d. Nov. 26, 1902, Seinai), Roman Catholic bishop and poet who wrote one of the greatest works in Lithuanian literature, *Anykščių šilėlis* (1858–59; *The Forest of Anykščiai*). The 342-line poem, written in East High Lithuanian dialect, describes the former beauty of a pine grove near his village and its despoliation under the Russians ("Hills with tree-stumps, bare slopes! Who would believe in your former beauty?"); it depicted in symbolic form the plight of Lithuania under the tsarist regime.

Baranauskas' interests included dialectology and mathematics, though his work in those disciplines was seriously compromised by his lack of training. Nevertheless, he provided the most detailed classification of Lithuanian dialects up to his time.

barangay, type of early Filipino settlement; the word is derived from *balangay*, the name for the sailboats that originally brought settlers of Malay stock to the Philippines from Borneo. Each boat carried a large family group, and the master of the boat retained power as leader, or *datu*, of the village established by his family.

Barangay villages sometimes grew to include 30 to 100 families, but the *barangays* re-

mained isolated from one another. Except on Mindanao, the part of the Philippines where Islām first got a foothold, no larger political grouping emerged. This fact greatly facilitated Spanish conquest of the Philippines in the 16th century, since resistance remained uncoordinated and sporadic. The Spaniards retained the *barangay* as their basic unit of local administration in the islands.

Baranī, Ziyā'-ud-Dīn, Baranī also spelled BARNI (b. 1285, India—d. after 1357), the first known Muslim to write a history of India; he resided for 17 years at Delhi as *nadīm* (boon companion) of Sultan Muḥammad ibn Tughluq.

Using mainly hearsay evidence and his personal experiences at court, Baranī in 1357 wrote the *Tārīkh-e Fīrūz Shāhī* ("History of Fīrūz Shāh"), a didactic work setting down the duties of the Indian sultan toward Islām. In his *Fatawā-ye jahāndārī* ("Rulings on Temporal Government"), influenced by Sūfī mysticism, he expounded a religious philosophy of history that viewed the events in the lives of great men as manifestations of divine providence. According to Baranī, the Delhi sultans from Ghiyās-ud-Dīn Balban (reigned 1266–87) to Fīrūz Shāh Tughluq (reigned from 1351) who had followed his guidelines for the good Islāmīc ruler had prospered, while those who had deviated from those precepts had failed.

Baranovich, also spelled BARANOVĪČI, town, Brest *oblast* (province), Belarus, on the southern edge of the Novogrudok Hills. It developed from a small village in the late 19th century into a major railway junction, with lines to Moscow, Warsaw, and other eastern European centres. It has cotton, food-processing, and machine construction industries. Pop. (1998 est.) 173,000.

Barante, Amable-Guillaume-Prosper Brugière, baron de (b. June 10, 1782, Riom, Fr.—d. Nov. 21, 1866, Le Dorat), French statesman, historian, and political writer, a liberal representative under the Bourbon restoration and a leading member of the narrative school of Romanticist historians who portrayed historical episodes with high literary style and in the vivid and intimate manner of a reportage of current events.

Educated at the École Polytechnique of Paris, Barante received his first civil service appointment in 1802. Named auditor to the council of state (1806), he went on several political missions to Germany, Poland, and Spain, later becoming subprefect of Bressuire (1807) and prefect of Vendée (1809). During the Hundred Days (1815), Barante took up the prefecture of Loire-Inférieure, and, with the second restoration of the Bourbons, he was made councillor of state and secretary-general of the ministry of the interior. Created a peer in 1819, he used this position to promote liberal reforms but was subsequently removed by the Duke de Richelieu.

After the revolution of 1830, which brought Louis-Philippe to power, Barante was named ambassador at Turin (1830) and later ambas-

sador at St. Petersburg (1835). Throughout Louis-Philippe's reign he remained a supporter of the government, withdrawing from political affairs, however, after the fall of the monarchy (1848).

Barante's most important historical work, *Histoire des ducs de Bourgogne* (1824–28; "History of the Dukes of Burgundy"), won him immediate admission to the Académie Française. Its moving narrative quality, purity of style, and brilliant use of local colour were highly praised; it exhibits, however, a lack of critical discernment and scientific scholarship. His other historical studies include *Histoire de la Convention Nationale*, 6 vol. (1851–53; "History of the National Convention"), and *Histoire du Directoire de la République française* (1855; "History of the Directory of the French Republic"). He also wrote biographies of Joan of Arc and other French historical figures, as well as a study of 18th-century French literature; furthermore, he is known as a translator of William Shakespeare and Friedrich von Schiller. Barante's political writings dealt with contemporary views on aristocracy and social organization.

Bárány, Robert (b. April 22, 1876, Vienna—d. April 8, 1936, Uppsala, Swed.), otologist who won the Nobel Prize in Physiology or Medicine in 1914 for his work on the physiology and pathology of the vestibular (balancing) apparatus of the inner ear. His name is associated with tests for detecting vestibular disease and for examining activities of the cerebellum and their relation to disturbances of equilibrium.

Bárány was graduated in medicine in 1900. After study at German clinics he became assistant at the ear clinic of the University of Vienna and, in 1909, a lecturer on otological medicine. From 1917 until his death he taught

Bárány, c. 1930

Archiv für Kunst und Geschichte, Berlin

at Uppsala University, where he was head of the ear, nose, and throat clinic.

Baranya, megye (county), southern Hungary, bounded to the south by the Drava River, and by the Mecsek Mountains in its northwestern area. Its area of 1,732 square miles (4,487 square km) is hilly, forested terrain. With adjacent Somogy *megye*, it is the most sparsely populated part of Hungary. The climate is semi-Mediterranean, and peaches, plums, sour cherries, grains, and vegetables are grown. Pigs and poultry are raised. Wines from the Villánykövesd district are well-known. The Mecsek Mountains are quarried for building stone, limestone, and marls for industrial use. Although Pécs (*q.v.*) is the *megye* seat, it is a county-level city, administratively independent of Baranya. Komló, 8 miles (13 km) north of Pécs, is a planned coal-mining town with a full range of social

services; its collieries have considerably expanded since World War II. Szigetvár is the site of a 16th-century fortress. In 1566 the Hungarian defenders of the fort blew themselves and the fort up rather than surrender to the Turks. At Siklós is a 13th-century castle with a fine Gothic and Renaissance interior. Pop. (2000 est.) 400,806.

Barāri Ghāt, Battle of (Jan. 9, 1760), in Indian history, one of a series of Afghan victories over the Marāthās in their war to gain control of the decaying Mughal Empire, which gave the British time in which to consolidate their power in Bengal. At the Barāri Ghāt (Ferry Station) of the Jumna (now Yamuna) River, 10 miles (16 km) north of Delhi, the Marāthā chief Dattāji Sindhia, retreating from the Punjab before the Afghan army of Aḥmad Shāh Durrāni, was surprised by Afghan troops who, concealed by high reeds, crossed the river. Dattāji was killed and his army scattered. His defeat opened the way to the Afghan occupation of Delhi.

Bārāsāt, town, southeastern West Bengal state, northeastern India. Connected by road and rail with Calcutta and Howrah, it is an important trade centre for rice, legumes, sugarcane, potatoes, and coconuts; cotton weaving is the major industry. An annual fair held in honour of a Muslim saint is attended by both Muslims and Hindus. Bārāsāt was constituted a municipality in 1869. Pop. (1991) 102,660.

barasingha, also called SWAMP DEER (species *Cervus duvauceli*), graceful deer, belonging to the family Cervidae (order Artiodactyla), found in open forests and grasslands of India and Nepal. The barasingha stands about

Barasingha, or swamp deer (*Cervus duvauceli*)
© Fred Bavendam—Peter Arnold, Inc

1.1 m (45 inches) at the shoulder. In summer, its coat is reddish or yellowish brown with white spots; in winter, its coat is heavier, particularly on the neck—brown with faint spots or none. The male of the species has long antlers that branch into a number of tines. Formerly more widespread, the barasingha is now found only in scattered areas and in national parks and reserves. It is listed in the *Red Data Book* as an endangered species.

Barat, Saint Madeleine-Sophie (b. Dec. 12, 1779, Joigny, Burgundy, Fr.—d. May 25, 1865, Paris; canonized 1925; feast day May 25), nun and founder of the Society of the Sacred Heart.

Born of peasant stock, Madeleine was expertly tutored by her brother Louis, deacon and master. After the French Revolution, she went to Paris with Louis, who had become a priest. His superior, Joseph Varin, appointed Madeleine to head an educational order dedicated to the Sacred Heart of Jesus. She made her first consecration in 1800. In 1801 the first Convent of the Sacred Heart was opened at Amiens, Fr., and she became superior in 1802.

In 1804 Madeleine journeyed to Grenoble, Fr., to found her second convent and to receive into the order Blessed Rose Philippine Duchesne, its first missionary. In 1806 Madeleine was elected superior general of the Sacred Heart order for life, and in 1815 the constitutions and rules of the order, drafted with Varin's help, were adopted. The Society of the Sacred Heart received ecclesiastical approval in 1826. During her lifetime the order spread from France to 11 other countries of Europe, Algeria, and North and South America. Under her guidance remarkable uniformity was established among the convents.

Barataria Bay, inlet of the Gulf of Mexico, about 15 miles (24 km) long by 12 miles (19 km) wide, in southeastern Louisiana, U.S. Its entrance, largely blocked by the Grand and Grand Terre islands, is via a narrow Gulf channel navigable through connecting waterways into the Gulf Intracoastal Waterway system. The bay is indented and marshy with many islands. The surrounding low-lying Barataria Country, south of New Orleans and west of the Mississippi River delta, is noted for its shrimp industry (based on villages built on pilings above the coastal marshes), muskrat trapping, and natural gas and oil wells. It is sometimes called Laffite Country after Jean Laffitte and his brother Pierre, who in 1810–14 organized a colony of pirates and smugglers around the Baratarian coast. The name Barataria is from the Spanish meaning "to deceive."

Baratieri, Oreste (b. Nov. 13, 1841, Condino, Lombardy, Austrian Empire [now in Italy]—d. Aug. 7, 1901, Sterzing, Tyrol, Austria-Hungary [now Vipiteno, Italy]), general and colonial governor who was responsible for both the development of the Italian colony of Eritrea and the loss of Italian influence over Ethiopia.

Baratieri had been a volunteer for Giuseppe Garibaldi, the popular hero of Italian unification, serving under him in the Sicilian and south Italian campaigns of 1860. He commanded a regiment in Eritrea in 1887–91 and was named commander in chief of Italian troops in Africa in 1891. Although he came in conflict with the civilian authorities in Eritrea for his encouragement of private investment in the colony, his views prevailed when he was named governor in 1893.

After opening Eritrea to private capital and extensive land settlement, Baratieri attempted, in 1895, to extend its borders into Ethiopia but was gravely defeated by the forces of the Ethiopian emperor, Menelik II, in the Battle of Adowa in 1896. This defeat led to the Italian recognition of full Ethiopian sovereignty and independence. Baratieri's court-martial for his rout at Adowa resulted in his acquittal. He was a deputy of the Italian legislature (1876–95) and author of *Memorie d'Africa* (1897; "Memoirs of Africa").

Baratynsky, Yevgeny Abramovich, Baratynsky also spelled BORATYNSKY (b. Feb 19 [March 2, New Style], 1800, Mara, Russia—d. June 29 [June 11], 1844, Naples), foremost

Baratynsky, detail from an engraving by E. Ckonnukobz
Novosti Press Agency

Russian philosophical poet contemporary with Aleksandr Pushkin. In his poetry he combined an elegant, precise style with spiritual melancholy in dealing with abstract idealistic concepts.

Of noble parentage, Baratynsky was expelled from the imperial corps of pages, entered the army, was commissioned, and retired in 1826. He married and settled at Muranovo, near Moscow. His early romantic lyrics are strongly personal, dreamy, and disenchanting. His narrative poems *Eda* (1826), *Bal* (1828; "The Ball"), and *Nalozhnitsa* (1831; "The Concubine"); rewritten as *Tsyganka*, "The Gypsy Girl," (1842) treat the emotions analytically. *Tsyganka* was attacked by critics of the time as "base" and "coarse." The poem *Na smert Gyote* (1832; "On the Death of Goethe") is one of his masterpieces. Tragic pessimism dominates his later poetry, which is mainly on philosophical and aesthetic themes. Modern critics value his thought more highly than did his contemporaries.

Barauni (India): see Bārūni.

Barb, also called BARBARY, native horse breed of the Barbary states of North Africa. It is related to, and probably an offshoot of, the Arabian horse but is larger, with a lower placed tail, and has hair at the fetlock (above and behind the hoof). The coat colour is usually bay or brown. Like the Arabian, it is noted for speed and endurance. A variety known as the Spanish-Barb is bred in small numbers in the United States.

barb, also called BARBEL (genus *Barbus*), any of numerous freshwater fishes belonging to a genus in the carp family, Cyprinidae. The

Barb (*Barbus schwanenfeldi*)
Gene Wolfsheimer

barbs are native to Europe, Africa, and Asia. The members of this genus typically have one or more pairs of barbels (slender, fleshy protuberances) near the mouth and often have large, shining scales. The species vary widely in size; certain barbs are only about 2.5–5 cm (1–2 inches) long, while the mahseer (*q.v.*) of India may be 2 m (6.5 feet) long. Several species are listed as endangered in the *Red Data Book*.

The barbel (*B. barbus*) of central and western European rivers is a slender, rather elongate fish with a thick-lipped, crescent-shaped mouth and four barbels, which it uses to search out fish, mollusks, and other food along the river bottom. The barbel is greenish and usually attains a length and weight of about 75 cm (30 inches) and 3 kg (6.5 pounds). It is a good sport fish.

There are many African and Asian members of the genus *Barbus*, those of the East Indian region sometimes being placed in a separate genus, *Puntius*. Some of these African and Asian species, such as the mahseer, are esteemed food or game fishes, while several of the small species are the popular barbs of home aquariums. Following are some barbs well known to aquarists:

Cherry barb (*B. titteya*), to 3 centimetres long; male silver to cherry-red, female silver

to pinkish; both sexes with a broad gold and black band on each side.

Clown barb (*B. everetti*), large, to 13 cm (5 inches); pinkish with red fins and several large, dark spots on each side.

Rosy barb (*B. conchonus*), to 5–6 cm (2–2.5 inches) in aquariums, larger in nature; colour silvery rose with dark spot near tail; breeding male deep rose with black-edged dorsal fin.

Sumatra, or tiger, barb (*B. tetrazona*), about 5 cm long; silvery orange with four vertical black stripes on each side.

Two-spot barb (*B. ticto*), 5–16 cm (2–6 inches) long; silvery with black spot near head and tail; dorsal fin of male reddish with black spots; no barbels.

Barbacena, city, southeastern Minas Gerais estado ("state"), Brazil. It is situated in the Serra da Mantiqueira, at 3,727 feet (1,136 m) above sea level. The settlement was made the seat of a municipality in 1791 and elevated to city rank in 1840. It is now the trade and manufacturing centre for an agricultural region that raises corn (maize), *feijão* (beans), rice, coffee, and various fruits and vegetables. The largest of Barbacena's industries are two textile factories. Railroads and highways link the city to Belo Horizonte, Rio de Janeiro (130 miles [210 km] south), and neighbouring communities. Pop. (2000 prelim.) 103,522.

Barbados, independent island nation in the West Indies, the most easterly of the Caribbean Islands. It is situated about 100 miles (160 km) east of the Windward Islands and about 270 miles (430 km) northeast of Venezuela, and covers an area of 166 square miles (430 square km). The capital is Bridgetown, the only seaport. Triangular in shape, Barbados extends at its maximum about 21 miles (34 km) from northwest to southeast and about 14 miles (23 km) from east to west. The population in 2000 was estimated at 267,000.

For information about regional aspects of Barbados, see MACROPAEDIA: West Indies.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. Geologically composed of coral accumulation (up to 300 feet [90 m] thick) on sedimentary rocks, Barbados is an island of low and flat relief, except in the north-central part where the highest point is reached at Mount Hillaby (1,115 feet [340 m] above sea level). The land falls in a series of terraces to the west and declines sharply in the east and south. The island is almost encircled with coral reefs. There is little surface water, but subterranean water, stored in the limestone beds, supports a few natural springs.

Barbados

Barbados has a moderate tropical climate with only two seasons, dry (December–May) and wet (June–November). Average temperatures range from 75° F (24° C) in February to

82° F (28° C) in September. Average precipitation is about 60 inches (1,525 mm), ranging from 40 inches (1,000 mm) on the coasts to 90 inches (2,300 mm) in the hilly central area. The island lies in the Caribbean hurricane zone.

Tropical trees such as mahogany, palm, casuarina, frangipani, and poinciana (flamboyant) are found on the island; flowering shrubs (wild roses, carnations, lilies, and several varieties of cactus) are widespread. Most of the level terrain is under sugarcane cultivation, and mangoes, avocados, citrus fruits, and guava are grown in orchards. Natural wildlife is limited to hare, mongoose (introduced), monkey, and a few birds, such as hummingbird, sparrow, dove, and blackbird. Small reserves of natural gas and petroleum exist in the southeast; some clay, limestone, and sand are quarried.

The people. More than 90 percent of the population is black. The remainder consists of whites, persons of mixed European and African ancestry, and East Indians. The population's average annual growth rate is low and has remained relatively stable since the 1960s, when family-planning services began. Birth and death rates have also declined sharply. Much emigration of males in search of employment, now mostly to other parts of the Caribbean and to North America, also has affected the growth rate; females significantly outnumber males. More than one-fourth of the population is younger than 15 years of age. English is the major language and Christianity the principal religion; some two-fifths of the population adheres to the Anglican church. Legal marriages are uncommon, and about 70 percent of all births are illegitimate. Barbados is one of the most densely populated countries in the world.

The economy. Barbados has a predominantly market economy based largely on tourism and the production and export of sugar. The gross national product (GNP) has grown slightly more rapidly than the population; the GNP per capita is about average for a Caribbean country.

Agriculture accounts for only a small percentage of the GNP and employs a comparable fraction of the work force. Most of the farmland is owned by large landowners or corporations. The production of sugar has declined as a result of slackening international demand, a shortage of arable land, and government-sponsored programs of agricultural diversification. Sugarcane cultivation was supplanted by tourism as the island's most important industry in the late 1960s. The production of food for local consumption has increased, and additional cash crops, such as Sea Island cotton, are also grown.

Limited quantities of petroleum and natural gas are produced. Manufacturing industries account for less than one-tenth of the GNP and employ a comparable fraction of the work force. Light industries predominate, and the government has encouraged investment in the production of pharmaceuticals, clothing, ceramics, glass, and electronics. Molasses and rum also are produced for export. The island has a network of good roads. Electricity is generated from imported and domestic fuels.

Tourism accounts for as much as one-half of the GNP and is a fast-growing segment of the economy. The government has shifted the burden of taxation from income to indirect taxes in an effort to benefit from tourist expenditures. Barbados joined the Caribbean Community and Common Market (Caricom) in 1973 and is a member of the Caribbean Development Bank, which is headquartered in Bridgetown. The Offshore Banking Act (1980), which guarantees low taxes and the confidentiality of accounts, has attracted numerous foreign financial institutions to Barbados. The United States is Barbados' principal supplier of imports.

Government and social conditions. Barbados is an independent state within The Commonwealth. Under its 1966 Constitution the British monarch, represented by the governor-general, is the head of state. Executive power is exercised by the prime minister, cabinet, and other appointed ministers, who are responsible to the parliament, where legislative power resides. The parliament is bicameral, consisting of the House of Assembly, with 27 elected members, and the Senate, with 21 members appointed by the governor-general, 12 on the advice of the prime minister, 2 on the advice of the leader of the opposition, and 7 at his own discretion. Members of both houses serve five-year terms. The major political parties are the Barbados Labour Party (BLP) and the Democratic Labour Party (DLP). The judicial system is headed by a High Court.

A social-security system established in 1967 provides benefits for sickness and maternity and for old age, disability, and survivor pensions.

Modern medical facilities are generally accessible, and Barbadians are relatively free from malnutrition and infectious diseases. The average life expectancy is about 73 years.

Education is free in state schools and compulsory between the ages of 5 and 16. The country's high literacy rate is attributable to its comprehensive primary-school system. Higher education is available at the Barbados campus of the University of the West Indies and at Codrington College, the oldest degree-granting institution in the English-speaking Caribbean.

Cultural life. The culture is based on folk arts and tradition. Barbados has drama groups, schools of dancing, and art exhibitions. The country is internationally known in the game of cricket.

History. The early history of Barbados is obscure, but the island was probably inhabited by Arawak Indians who originally came from South America. There is some evidence that Spaniards had landed by 1518, and, apparently, by 1536 no Indians remained on the island.

In 1624 or early 1625, John Powell led an expedition to the island, and in 1627 his younger brother, Captain Henry Powell, landed a party of English settlers. Slaves were brought in from Africa to work sugar plantations. Slavery was abolished in the British Empire in 1834, and all the slaves on Barbados were freed by 1838. This impaired but did not ruin the island's economy.

Widespread riots and disorders erupted in Barbados and the British West Indies in 1937–38, fueled by a rapidly growing population, the closing of emigration outlets, and economic depression. A British Colonial Welfare and Development Organization was subsequently established and provided large sums of money for Barbados and other colonies. In addition, black reformers became active participants in Barbadian politics.

In 1958 Barbados joined the West Indies Federation, and the chief minister of the island, Sir Grantley Adams, became the first prime minister of the federation. In 1962 the federation was dissolved, and Barbados sought and gained (1966) independence within the Commonwealth. In the first elections the DLP won a majority of seats in the House of Assembly. Errol Barrow, leader of the party, became the first prime minister. Since independence, the social and political objectives of the BLP and DLP have not differed significantly, as both parties have followed moderate socialist philosophies. Barbados has maintained a relatively high degree of political stability.

Barbados cherry, also called WEST INDIAN CHERRY, or ACEROLA, common name for various tropical and subtropical trees and shrubs

of the genera *Bunchiosa* and *Malpighia* (family Malpighiaceae), especially *M. glabra*, *M. pumilio*, and *M. urens*.

The *Malpighia* species bear edible fruits, rich in vitamin C, that are used in preserves and commercial vitamin production. They are native to the West Indies and southern Texas southward to northern South America. *M.*

Barbados cherry (*Malpighia glabra*)

Douglas David Dawn

glabra, the species perhaps most often called Barbados cherry, grows about 3.6 metres (12 feet) tall. The flowers, which appear throughout the summer, are pink or rosy, 2 centimetres (nearly one inch) in diameter, and grow from the leaf axils in clusters of three to five. The tart, red fruit is the size of a cherry.

Barbados Ridge, submarine ridge of the Caribbean Sea rising from the southern end of the axis of the Puerto Rico Trench. The Barbados Ridge is paralleled on either side by a shallow trough. Negative gravity anomalies (observed gravity values less than theoretically calculated values because of a mass deficiency at depth in the Earth) associated with the Puerto Rico Trench extend over the Barbados Ridge, and thus structural continuity between these two features is established.

Barbara, SAINT (d. c. 200; feast day December 4), virgin martyr of the early church and patroness of artillerymen. According to legend, which dates only to the 7th century, she was the daughter of a pagan, Dioscorus, who kept her guarded to protect her beauty from harm. When she professed Christianity, he became enraged and took her to the provincial prefect, who ordered her to be tortured and beheaded. Dioscorus himself performed the execution and, upon his return home, was struck by lightning and reduced to ashes.

Some accounts name the ancient Egyptian city of Heliopolis, others Nicomedia or a town in Tuscany, as the scene of her sufferings. The original Greek accounts of her martyrdom are lost, but Syriac, Latin, and other versions are extant. Her story, reproduced in great detail in Jacobus de Voragine's *Legenda aurea* (1255–66; *Golden Legend*, 1483), was popular in the Middle Ages.

Venerated as one of the 14 Auxiliary Saints (Holy Helpers), she is invoked in thunderstorms. Because Barbara's authenticity is highly questionable and her legend is probably spurious, she was dropped from the church calendar in 1969.

Barbarelli, Giorgio (painter): see Giorgione.

Barbari, Jacopo de', Jacopo also spelled IACOPO, also known in the north as JAKOB WALCH (Jacob the Foreigner) (b. 1440—d. 1516), Venetian painter and engraver who

probably painted the first signed and dated (1504) pure still life (a dead partridge, gauntlets, and arrow pinned against a wall). Until c. 1500 he remained in Venice. A large engraved panorama of the city is among the Venetian works attributed to him. An acquaintance of Albrecht Dürer, he moved to the north where he worked as a court painter in the German cities of Wittenberg, Nürnberg, and Frankfurt an der Oder and finally settled at the Dutch court. Like Dürer, who consulted him on technique, Barbari engraved on copper and made woodcuts.

Barbarossa: see Frederick I under Frederick (Germany/Holy Roman Empire).

Barbarossa (Redbeard), byname of KHAYR AD-DIN, original name KHIDR (d. 1546), Barbary pirate and later admiral of the Ottoman fleet, by whose initiative Algeria and Tunisia became part of the Ottoman Empire. For three centuries after his death, Mediterranean coastal towns and villages were ravaged by his pirate successors.

Khidr was one of four sons of a Turk from the island of Lesbos. Hatred of the Spanish and Portuguese who attacked North Africa between 1505 and 1511 encouraged Khidr and his brother 'Arūj to intensify their piracy. They hoped, with the aid of Turks and Muslim emigrants from Spain, to wrest an African domain for themselves and had begun to succeed in this design when 'Arūj was killed by the Spanish in 1518. Khidr, who had been his brother's lieutenant, then assumed the title Khayr ad-Din. Fearing he would lose his possessions to the Spanish, he offered homage to the Ottoman sultan and in return was granted the title *beylerbey* and sent military reinforcements (1518). With this aid Khayr ad-Din was able to capture Algiers in 1529 and make it the great stronghold of Mediterranean piracy. In 1533 he was appointed admiral in chief of the Ottoman Empire, and the next year he conquered the whole of Tunisia for the Turks, Tunis itself becoming the base of piracy against the Italian coast. The Holy

Barbarossa, watercolour miniature by Haydar Reis, middle of the 16th century; in the Topkapı Sarayı Museum, Istanbul

By courtesy of the Topkapı Sarayı Museum, Istanbul

Roman emperor Charles V led a crusade that captured Tunis and Goletta in 1535, but Barbarossa defeated Charles V's fleet at the Battle of Preveza (1538), thereby securing the eastern Mediterranean for the Turks (until their defeat at the Battle of Lepanto in 1571). Barbarossa remained one of the great figures of the court at Constantinople until his death.

Barbary, also called BARBARY STATES, former designation for the coastal region of North Africa bounded by Egypt (east), by the Atlantic (west), by the Sahara (south), and

by the Mediterranean Sea (north), and now comprising Morocco, Algeria, Tunisia, and Libya. The name originates from that of the Berbers, the oldest known inhabitants of the region, and was for centuries associated with the coastal pirates who preyed upon Mediterranean shipping. The term was in use until occupation of the region by European powers in the 19th century (see Maghrib).

Barbary (horse): see Barb.

Barbary ape, also called MAGOT (*Macaca sylvana*), tailless, terrestrial macaque (*q.v.*) found in bands in Algeria, Morocco, and on the Rock of Gibraltar. The Barbary ape is about 60 centimetres (24 inches) long and has light yellowish-brown fur and a naked, pale-pink face. It is the only wild monkey in Europe

Barbary ape (*Macaca sylvana*)

Tom McHugh—Photo Researchers

and may have been taken westward during the Muslim Arab territorial expansion of the Middle Ages. According to legend, British dominion will end when the Barbary ape is gone from the British-held Rock of Gibraltar.

Barbary pirate, any of the Muslim pirates operating from the coast of North Africa, at their most powerful during the 17th century but still active until the 19th century. Captains, who formed a class in Algiers and Tunis, commanded cruisers outfitted by wealthy backers, who then received 10 percent of the value of the prizes. The pirates used galleys until the 17th century, when Simon Danser, a Flemish renegade, taught them the advantage of using sailing ships.

North African piracy had very ancient origins. It gained a political significance during the 16th century, mainly through Barbarossa (Khayr ad-Din), who united Algeria and Tunisia as military states under the Ottoman sultanate and maintained his revenues by piracy. With the arrival of powerful Moorish bands in Rabat and Tétouan (1609), Morocco became a new centre for the pirates and for the Alawi sultans, who quickly gained control of the two republics and encouraged piracy as a valuable source of revenue. During the 17th century, the Algerian and Tunisian pirates joined forces, and by 1650 more than 30,000 of their captives were imprisoned in Algiers alone. Piratical practices were the cause of several wars between Tripolitania and the United States in the 19th century. The British made two attempts to suppress Algerian piracy after 1815, and it was finally ended by the French in 1830.

Barbary sheep: see aoudad.

barbastellé (*Barbastella*), either of two bats of the common bat family, Vespertilionidae, found in Europe (*B. barbastellus*) and in the Middle East and Asia (*B. leucomelas*). Barbastelles have short, wide ears that are joined on the forehead and long, dark, white- or gray-tipped fur. They are about 4–6 centimetres (1.6–2.4 inches) long without the 4–5.5-cm tail and weigh about 6–10 grams (0.2–0.3 ounce). Relatively heavy fliers, barbastelles live alone or in small groups and roost in trees or buildings. From fall to spring they hibernate in caves.

Barbé-Marbois, François, marquis de (b. Jan. 31, 1745, Metz, Fr.—d. Jan. 14, 1837, Paris), French statesman who in 1803 negotiated the Louisiana Purchase by the United States.

After serving as a diplomat in Germany and with the American colonists, Barbé-Marbois was an intendant of Santo Domingo (1785–89). Returning to France, he became a deputy in the Council of Ancients (1795–97) but was exiled later as a monarchist to French Guiana (1797–99). Recalled to France in 1800, he became minister of the treasury and, as such, negotiated the sale of Louisiana to the United States, getting a better price than had been expected. Napoleon dismissed him in 1806 because his excessive advances to contractors in 1805 had caused a grave financial crisis. He was, however, appointed first president of the Cour des Comptes (an administrative court handling public accounts of the country) in 1808 and was made a senator and a count in 1813. When Napoleon's fall became likely, Barbé-Marbois hastily and successfully attached himself to the Bourbons and was made a peer of France (1814), a minister of justice (1815–16), a marquis (1817), and again president of the Cour des Comptes (1816–34). In 1834 he switched his loyalties to the July Monarchy of 1830.

barbecue, an outdoor meal, usually a form of social entertainment, at which meats, fish, or fowl, along with vegetables, are roasted over a wood or charcoal fire. The term also denotes the grill or stone-lined pit for cooking such a meal, or the food itself, particularly the strips of meat. The word "barbecue" came into English via the Spanish, who adopted the term from the Arawak Indians of the Caribbean, to whom the *barbacoa* was a grating of green wood upon which strips of meat were placed to cook or to dry over a slow fire.

Barbecuing is popular throughout the United States, especially in the South, where pork is the favoured meat, and in the Southwest, where beef predominates. Other foods barbecued are lamb or kid, chicken, sausages, and, along the Gulf and Atlantic coasts, seafood. Basting and marinating sauces also reflect regional tastes, vinegar-based sauces in the Carolinas, tomato-based in the West and Midwest, and the spiciest versions in the Southwest.

barbed wire, fence wire usually consisting of two longitudinal wires twisted together to form cable and having wire barbs wound around either or both of the cable wires at regular intervals. The varieties of barbed wire

Barbed wire used for fencing, 19th century; from the collection of Jesse S. James

By courtesy of Jesse S. James, Maywood, Calif.

are numerous, with cables being single or double, round, half-round, or flat and having a range of gauges. The twisted double cable provides extra strength and permits contraction and expansion without breakage. Barbs are diagonally cut in order to provide sharper

points; they may consist of one or two pieces (two or four points) and are generally spaced at intervals of 4 to 5 inches (10 to 13 cm).

The first patents on barbed wire were taken out in the United States in 1867, but it was not until 1874, when Joseph Glidden of De Kalb, Ill., invented a practical machine for its manufacture, that the innovation became widespread. By 1890, fenced pastureland had virtually replaced the open range in the western United States.

Barbeitos, Arlindo (do Carmo Pires) (b. Dec. 24, 1940, Angola), Angolan poet, many of whose works, written in Portuguese, portray in a subtle manner the struggle of his people for independence as well as the essential harmony between man and nature.

From 1965 to 1969 Barbeitos studied in West Germany. He returned home to teach at several bases of the Popular Movement for the Liberation of Angola during Angola's struggle for independence. He later returned to Europe for treatment of tuberculosis and continued his graduate studies in ethnology at the University of West Berlin.

Barbeitos' poetry includes *Angola Angolê Angolema* (1976) and *Nzaji* (1979; "Dream"). His poems are noted for their concentration and density of thought, tenderness of tone, and ultimate simplicity of style.

Barbellion, W.N.P.: see Cummings, Bruce Frederick.

barber, a person whose primary activities in the 20th century are trimming and styling the hair of men, shaving them, and shaping their beards, sideburns, and moustaches. Barbers, or hairdressers, often provide shampooing, manicuring, hair dyeing, permanent waves, and shoe polishing within their shops, or salons. See also hairdressing.

The barbershop was a familiar institution in ancient Greece and Rome and then, as now, was a centre for the exchange of gossip and opinion. The more prosperous citizens, however, particularly in Rome, had household barbers. The great houses of ancient Egypt also had barbers among their retainers and offered the services of these as part of their hospitality to guests.

For six centuries the barbers of Europe practiced surgery. This custom began with the papal decree of 1163 that forbade the clergy to shed blood. Monks were required to undergo bloodletting at regular intervals, and some of them had been performing this task, along with minor surgery. Now they turned these duties over to the barbers—familiar figures at the monasteries since 1092, when the clergy had been required to be clean-shaven. This arrangement was satisfactory to the medical doctors of the era, who considered that bloodletting was necessary but beneath their dignity. They were also glad to relegate to the barbers other physical tasks such as the lancing of abscesses and treatment of wounds. At the beginning of his career, Ambroise Paré, one of the great pioneers of surgery, was among those who gave shaves and haircuts for a living.

In France a royal decree of 1383 declared that "the king's first barber and valet" was to be head of the barbers and surgeons of the kingdom, who had been organized in a guild in 1361. The barbers of London were first organized as a religious guild but were granted a charter as a trade guild in 1462 by King Edward IV. This guild was amalgamated with that of the surgeons in 1540 under a charter granted by Henry VIII, and the members of the joint corporation were accorded the right to be addressed as "Master"—colloquially, "Mister." British surgeons still prefix their names with "Mr." instead of "Dr."

The barber-surgeons were sometimes called "doctors of the short robe" to distinguish them from university-trained physicians and surgeons, whose superiority was apt to be only

in their knowledge of Latin and their title of "doctor of the long robe." In England the guild of surgeons was separated from that of barbers in 1745. The Royal College of Surgeons, however, did not receive its charter until 1800.

The barber's trade was acquired only by a long apprenticeship until the 1890s, when schools for barbering were established.

Barber, Samuel (b. March 9, 1910, West Chester, Pa., U.S.—d. Jan. 23, 1981, New York, N.Y.), composer who is considered one of the most expressive representatives of the lyric and romantic trends in musical composition in the United States.

Barber studied the piano from an early age and soon began to compose. In 1924 he entered the Curtis Institute of Music in Philadelphia, where, in addition to piano and composition, he studied singing and conducting. After graduation in 1934, Barber devoted himself entirely to composition. He developed a distinctive style, absorbing some technical procedures of modern music but without indulging in experimentation for its own sake. He established his reputation with his overture to *The School for Scandal* (1933), based on Sheridan's comedy by that name, and with *Music for a Scene from Shelley* (1935), inspired by the poet Percy Bysshe Shelley's *Prometheus Unbound*.

Although many of Barber's works make literary allusions, his music is not programmatic in the strict sense. Significant in this respect are the two *Essays for Orchestra* (1938, 1942), which are intended as musical counterparts of the literary form. Structural considerations govern Barber's instrumental writing; there is great astringency in harmony, but the basic

Barber

By courtesy of G. Schirmer Inc.

tonality remains secure; the rhythmic lines are very strong, without loss of coherence.

In 1936 Barber composed his *String Quartet*, the slow movement of which, arranged for string orchestra, was performed under the title *Adagio for Strings* by the NBC Symphony Orchestra under Arturo Toscanini in 1938 and acquired extraordinary popularity both in the United States and in Europe.

Barber's *First Symphony* (1936; revised, 1942) is in the Romantic tradition. In the *Second Symphony* (1944; revised, 1947), commissioned by the U.S. Army Air Forces (which he had joined in 1943), Barber introduced an electronic instrument imitating radio signals for air navigation, replaced in the revised version by an E-flat clarinet.

Barber also wrote a *Violin Concerto* (1941) and a *Cello Concerto* (1946). His *Piano Sonata* (1949) is the most ambitious work in this form by an American composer. Other compositions are *Dover Beach*, for voice and string quartet (1931); three vocal works with orchestra, *Knoxville: Summer of 1915* (1948), *Prayers of Kierkegaard* (1954), and *Andromache's Farewell* (1962); *Medea* (1947); and the opera *Vanessa*, produced by the Metropoli-

tan Opera Association, New York City, in 1958, which was awarded a Pulitzer Prize.

Barber's *Piano Concerto* (1962) brought him new international success and another Pulitzer Prize (1963). His opera *Antony and Cleopatra* opened the new auditorium of the Metropolitan Opera Association at the Lincoln Center for the Performing Arts in 1966. After a period of creative inactivity, Barber resumed composing for orchestra. *The Lovers* and *Fado-graph of a Yestern Scene* were first performed in 1971 and *Third Essay for Orchestra* had its premiere in 1980.

barber shop quartet singing: see barber-shop quartet singing.

Barbera, Joseph (Roland): see Hanna, William (Denby); and Barbera, Joseph (Roland).

Barberi, Domenico, BLESSED, also called DOMINIC OF THE MOTHER OF GOD (b. June 22, 1792, Viterbo, Papal States [Italy]—d. Aug. 27, 1849, Reading, Berkshire, Eng.), mystic and Passionist who worked as a missionary in England.

Born a peasant and raised without any formal education, Barberi entered the Passionist order as a lay brother and was ordained a priest in 1818. In 1821, when he had finished his studies, he became lecturer in theology at a Passionist college near Vetralla. He then had assignments in Rome (from 1824), Lucca (1831), southern Italy (1833), and Belgium (1840).

In 1841 he acquired a Passionist house at Aston, Staffordshire, and in 1845 he received John Henry Newman (later Cardinal Newman) into the Roman Catholic church. He founded four Passionist houses in England and made plans for one in Ireland, which was established after his death. He was declared venerable in 1911 and beatified in 1963.

Barberini FAMILY, an aristocratic Roman family, originally of Barberino in the Elze valley; they later settled first in Florence and then in Rome, where they became wealthy and powerful.

Antonio Barberini defended Florence in 1530 and then went to Rome, to which in 1555 he summoned his nephew Francesco (1528–1600), the real founder of the Barberini dynasty. Francesco and his brother Raffaello accumulated the riches and trade advantages that became the base of the Barberini power. Francesco (1597–1679) was the first cardinal nominated by his uncle Pope Urban VIII (October 1623). The second family member Urban named cardinal was his brother Antonio the Elder (1569–1646), who is notable chiefly for encouraging the construction of religious buildings in Rome.

Antonio the Younger (1607–71), Urban's nephew, who became the family's third cardinal in 1628, proved himself an able negotiator and was entrusted with certain legations, including those of Urbano (1631) and Avignon (1633). A patron of the arts, he supported, among others, the Baroque sculptor and architect Gian Lorenzo Bernini (1598–1680). He also collected an extensive library, which after his death was absorbed into the great library of his brother Francesco.

The Barberini became universally hated and came into conflict with several powerful families, especially the Farnese, who formed a league against them and defeated them at Lagoscuro (March 30, 1644). This defeat, together with the death of Urban, severely weakened the position of the Barberini.

When the newly elected Innocent X (pope 1644–55) began an investigation into charges of the Barberini's misuse of church funds, Taddeo, Francesco, and Antonio the Younger fled to Paris. Protected by the French cardi-

nal Jules Mazarin, they enjoyed comfortable positions. With Mazarin's help, and with the arrangement of the marriage of Taddeo's son Maffeo to Olimpia Giustiniani, Innocent's protégée, the Barberini were reconciled to Innocent in 1653. Taddeo died in Paris, but both Francesco (1648) and Antonio (1653) returned to Rome and lived in the magnificent Barberini Palace in Rome, built under the supervision of Bernini.

The family retained power for some time, mainly through wise marriages, including that of Lucrezia, daughter of Taddeo, to Francesco II, duke of Modena. The Barberini died out in 1736, and their estate passed to the Colonna.

Barberini, Maffeo (pope): see Urban VIII.

barberry, any of almost 500 species of thorny evergreen or deciduous shrubs constituting the genus *Berberis* of the family Berberidaceae, mostly native to the North Temperate Zone, particularly Asia. Species of Oregon grape,

American barberry (*Berberis canadensis*)

Walter Chandoha

previously included in *Berberis* but now assigned to the genus *Mahonia*, are sometimes called barberry (see Oregon grape).

Plants of the genus *Berberis* have yellow wood, yellow, six-petaled flowers, and usually three-branched spines at the base of leafstalks. The fruit is a red, yellow, blue, purple, or black berry, with one to several seeds. The fruits of several species are made into jellies. Yellow dyes are extracted from some South American and Asian barberry plants.

The American or Allegheny barberry (*B. canadensis*) is native to eastern North America. Japanese barberry (*B. thunbergii*) often is cultivated as a hedge or ornamental shrub for its scarlet fall foliage and bright-red, long-lasting berries. Several varieties with purple or yellow foliage, thornlessness, or dwarf habit are useful in the landscape. Another widely planted species is wintergreen barberry (*B. julianae*), an evergreen shrub with bluish black berries. The cultivation of certain barberry species is prohibited in some regions because they harbour one of the spore stages of the fungus that causes black stem rust of wheat.

barbershop quartet singing, barbershop also spelled BARBER SHOP, form of popular choral music consisting of unaccompanied male singing, with three voices harmonizing to the melody of a fourth voice. The voice parts are tenor, lead, baritone, and bass, with the lead normally singing the melody and the tenor harmonizing above. The emphasis is on close, carefully arranged harmony, synchronization of word sounds, and the use of such devices as variation of tempo, volume level, diction, colour, and phrasing. Phrases are often repeated for echo effect, and musical arrangements usually employ syncopated ragtime and other nostalgic song styles.

Although barbershop quartet singing is associated with the United States, its origins (in the 19th century) are obscure: it may date from an era when American barbershops formed social and musical centres for a neighbourhood's males, or it may refer back to the British expression "barber's music," denoting an ex-

temporized performance by patrons waiting to be shaved and referring to a barber's traditional role as a musician. In any event, the modern Society for the Preservation and Encouragement of Barber Shop Quartet Singing in America (SPEBSQSA, Inc.) was founded by Owen Clifton Cash, Rupert I. Hall, and 24 other men who attended a first meeting and songfest at the Tulsa Club in Tulsa, Okla., U.S., on April 11, 1938. The society flourished, and by the late 20th century it had more than 800 chapters with more than 38,000 members. It holds an annual convention and contests, in which about 50 quartets and 16 choruses compete, and it publishes the bimonthly magazine *The Harmonizer*. International headquarters are in Kenosha, Wis.

Barberton, city, Summit county, northeastern Ohio, U.S., just south of Akron, on the Tuscarawas River, there dammed to form the Portage Lakes. It was founded in 1891 by Ohio C. Barber as the new site of his match factory (later the Diamond Match Company), which had been established in 1867 in Akron. Manufactures now include chemicals, heavy boilers, rubber goods, metal and iron products, and insulators. A local deposit of limestone more than 345 feet (105 m) thick and 0.5 miles (0.8 km) below the surface of the Earth has one of the deepest mines of its kind in the world. Inc. city, 1892. Pop. (1990) 27,623.

barbet, any of about 75 species of tropical birds constituting the family Capitonidae (order Piciformes). Barbets are named for the bristles at the bases of their stout, sharp bills. They are big-headed, short-tailed birds, 9–30 cm (3.5–12 inches) long, greenish or brownish, with splashes of bright colours or white. The smallest barbets are known as tinkerbirds (see tinkerbird). The distribution of the family spans Central America to northern South America; sub-Saharan Africa; and Southeast Asia, eastward only to Borneo and Bali. All are nonmigratory.

Barbets sit stolidly in treetops when not feeding on insects, lizards, birds' eggs, fruit, and

Crimson-headed barbet (*Capito bourcierii*)

C. Laubscher—Bruce Coleman Inc./EB Inc

berries. Some climb like woodpeckers; all fly weakly. The nest is a hole, dug with the beak, high up in a rotting tree or in a termite nest.

Barbets call loudly, jerking the head or tail; a male and a female may call alternately or together. Some species, such as the coppersmith (*Megalaima haemacephala*) of Asia and the African tinkerbirds of the genus *Pogoniulus*, are noted for their ringing calls. Maddeningly vocal or repetitious species are sometimes called brain-fever birds.

Barbey d'Aureville, Jules-Amédée (b. Nov. 2, 1808, Saint-Sauveur-le-Vicomte, Fr.—d. April 23, 1889, Paris), French novelist and influential critic; he was an arbiter, in his day, of social fashion and literary taste. A member of the minor nobility of Normandy, he remained throughout his life proudly Norman in spirit and style, a royalist opposed to

Barbey d'Aurevilly, detail of an oil painting by Émile Lévy, 1881; in the National Museum of the Château de Versailles, France

J.E. Bulloz

democracy and materialism and an ardent but unorthodox Roman Catholic.

After study at the Stanislas College in Paris (1827–29) and, in law, at Caen (1829–33), Barbey d'Aurevilly established himself in Paris in 1837 and began to earn a precarious living by writing for periodicals. Despite his evident poverty, he went to great lengths to establish himself as a dandy.

Barbey d'Aurevilly was appointed, in 1868, to alternate with Charles-Augustin Sainte-Beuve as literary critic for *Le Constitutionnel*, and on Sainte-Beuve's death in 1869 he became sole critic. Though often arbitrary, vehement, and intensely personal in his criticism, especially of Émile Zola and the Naturalist school, many of his verdicts have stood the test of time; he recognized the attainments of Honoré de Balzac, Stendhal, and Charles Baudelaire when they were far from being fully appreciated.

His own novels are set in Normandy, and most of them are tales of terror in which morbid passions are acted out in bizarre crimes. Two of his best works are set against a background of the French Revolution: *Le Chevalier des Touches* (1864), dealing with the rebellion of the Chouans (bands of Norman outlaws) against the French Republic, and *Un Prêtre marié* (1865; "A Married Priest"), dealing with the sufferings of a priest under the new regime. *Les Diaboliques* (1874; *Weird Women*), a collection of six short stories, is often considered his masterpiece.

Barbeya, genus of dicotyledonous flowering tree, the sole species of which is *B. oleoides*. It grows in Ethiopia and Somalia and on the Arabian Peninsula. *Barbeya* has the general aspect of the olive tree but many botanical characteristics of the elm. Because of its latter affinity, *Barbeya* is included in the nettle order (Urticales) as a separate family, Barbeyaceae; the taxonomic placement of the family is uncertain, however.

Barbie, in full BARBARA MILLICENT ROBERTS, an 11½-inch- (29-cm-) tall plastic doll with the figure of an adult woman that was introduced in 1959 by Mattel, Inc., a southern California toy company. Ruth Handler, who cofounded Mattel with her husband, Elliot, spearheaded the introduction of the doll.

Since the doll's inception, its body has incited controversy. Mothers, in a 1958 Mattel-sponsored market study held before the doll's release, criticized Barbie for having "too much of a figure." Mattel circumvented this problem, however, by advertising Barbie directly to children via television.

Responding to consumer demand, in 1961 Mattel brought out Barbie's ultimate "accessory"—her boyfriend, Ken. In 1963 Mattel added Barbie's best friend, Midge, and in 1964 her little sister, Skipper. By 1968 Barbie had been issued friend dolls of colour, but not until

1980 was the Barbie doll itself released in an African American incarnation.

Since the 1970s Barbie has been criticized for materialism (amassing cars, houses, and clothes) and unrealistic body proportions. Yet many women who had played with the doll in their youth credit Barbie with providing an alternative to restrictive 1950s gender roles. Unlike baby dolls, Barbie did not teach nurturing. Outfitted with career paraphernalia, the doll was a model for financial self-sufficiency. (Barbie's résumé includes, among other things, airline pilot, astronaut, doctor, Olympic athlete, and United States presidential candidate.) Nor was the doll defined by relationships of responsibility to men or family. Barbie has no parents or offspring. When in the early 1960s consumers clamoured for a Barbie-scale baby, Mattel did not make Barbie a mother but issued a "Barbie Baby-Sits" playset.

First-edition Barbie, 1959

Today the doll has come to symbolize consumer capitalism and is as much a global brand as Coca-Cola, with key markets in Europe, Latin America, and Japan. Barbie never caught on in the Muslim world, however. In 1995 Saudi Arabia stopped its sale because it violated the Islamic dress code. (Eventually, similar dolls, some complete with the *hijāb* [head coverings], were marketed to Muslim girls by specialty toy companies.)

Mattel registered Barbie as a work of art, but the doll has also inspired works of art, including a 1986 Andy Warhol portrait. When interpreting Barbie, artists tend to take one of two approaches: idealizing the doll or, more commonly, using the doll to critique ideas associated with it, from exaggerated femininity to profligate consumption.

Barbie is a very popular collectible. Aficionados are interested in both old Barbies and the special-edition Barbies, which Mattel creates to cater to this market. Barbie's sales amount to over a billion dollars annually. (M.G.Lo.)

Barbie, Klaus, byname BUTCHER OF LYON, French BOUCHER DE LYON (b. Oct. 25, 1913, Bad Godesberg, near Bonn, Ger.—d. Sept. 25, 1991, Lyon, France), Nazi leader, head of the Gestapo in Lyon in 1942–44, held responsible for the death of some 4,000 persons and the deportation of some 7,500 others.

Barbie was a member of the Hitler Youth and joined the SD (Sicherheitsdienst, or Security Service), a special branch of the SS (Schutzstaffel, the black-shirted, elite guard of the Nazi Party), in 1935. After German forces overran western Europe in World War II, Barbie served in The Netherlands and then, in 1942, was made chief of Gestapo Department IV in Lyon. (The SD was closely related to the

Gestapo, and personnel were frequently transferred from one to the other.) In this position he became especially active against French partisans, promoting the torture and execution of thousands of prisoners. He personally tortured prisoners whom he interrogated. Among the more specific charges against him were that he ordered the death of Resistance leader Jean Moulin and the deportation of 44 Jewish children (aged 3–13) and their five teachers, all of whom later were delivered to the Auschwitz extermination camp.

After the war he was seized by American authorities, who recruited him (1947–51) for counterintelligence work and then spirited him and his family out of Germany to Bolivia (for which the U.S. government later officially apologized to France). He lived there as a businessman under the name Klaus Altmann from 1951 until he was extradited, having been tracked down in Bolivia in 1972. After long negotiations, the Bolivian government extradited him to France in February 1983 to stand trial. (He had twice been sentenced in absentia to death by a postwar French military tribunal.) In 1987 Barbie, who remained unrepentant and proud of his service to the Nazis, went on trial in Lyon and was convicted of "crimes against humanity," for which he was sentenced to life imprisonment.

barbiturate, any of a class of organic compounds used in medicine as sedatives (to produce a calming effect), as hypnotics (to produce sleep), or as an adjunct in anesthesia. Barbiturates are derivatives of barbituric acid (malonyl urea), which is formed from malonic acid and urea. Barbitol was first synthesized in 1903, and phenobarbital became available in 1912. Barbiturates act by depressing the central nervous system, particularly certain portions of the brain, though they tend to depress the functioning of all the body's tissues. Most of them exert a sedative effect in small doses and a hypnotic effect in larger doses.

Barbiturates are classified according to their duration of action. The effects of long-acting barbiturates, such as barbital and phenobarbital, may last for as long as 24 hours and are used in conjunction with other drugs for the treatment of epilepsy, in which their prolonged depressant action helps prevent convulsions. Barbiturates of intermediate duration of action, such as amobarbital and butabarbital sodium, act for 6 to 12 hours and are used to relieve insomnia. Short-acting barbiturates, such as pentobarbital and secobarbital, are used to overcome difficulty in falling asleep. Ultrashort-acting barbiturates, such as thiopental sodium and thiamylal, are used intravenously to induce unconsciousness smoothly and rapidly in patients about to undergo surgery, after which gaseous anesthetics are used to maintain the unconscious state. The barbiturates have largely been replaced as sedatives by the benzodiazepines and other minor tranquilizers.

The prolonged use of barbiturates—especially secobarbital and pentobarbital—may cause the development of a tolerance to them, thereby requiring larger amounts than the original therapeutic dose. Denial of a barbiturate to the habitual user may cause a withdrawal syndrome because of the user's physiological dependence on the drug. An overdose of barbiturates can result in a coma and even death due to severe depression of the central nervous and respiratory systems.

The abuse of barbiturate drugs became prevalent in Western societies between the 1940s and '70s. In North America barbiturates were widely used as depressants by youth gangs and deviant subcultures and attracted notoriety because they were often taken in combination with other substances—for ex-

ample, stimulants such as amphetamines. Alcohol greatly intensifies the depressant effect of barbiturates, and in the 1950s and '60s, barbiturates taken with alcohol became a common means of suicide. Barbiturates became a frequent target of anti-drug campaigns. The use and availability of barbiturates in the United States declined steeply following the federal Comprehensive Drug Abuse Prevention and Control Act of 1970. As street drugs, barbiturates were largely replaced by other substances, especially by PCP (phenylclidine).

barbituric acid, an organic compound of the pyrimidine family, a class of compounds with a characteristic six-membered ring structure composed of four carbon atoms and two nitrogen atoms, that is regarded as the parent compound of the barbiturate drugs. It issued in the production of riboflavin, a nutritional factor (see vitamin B₂).

Barbizon school, mid-19th-century French school of painting, part of a larger European movement toward naturalism in art, that made a significant contribution to the establishment of realism in French landscape painting. Although inspired by the Romantic movement's search for solace in nature, the Barbizon painters turned away from the melodramatic picturesque of established Romantic landscape painters as well as from the classical academic tradition, which used landscape merely as a backdrop for allegory and historical narrative. The Barbizon artists painted landscape in realistic terms and for its own sake. They based their art on the works of 17th-century French and Dutch and contemporary English landscape painters, all of whom approached their subject with sensitive observation and a deep love of nature.

The name of the school was taken from the village of Barbizon, on the edge of the great forest of Fontainebleau near Paris, where the school's leaders, Théodore Rousseau and Jean-François Millet, driven from Paris by poverty and lack of success, settled in 1846

"The Forest at Fontainebleau," Barbizon school painting by Théodore Rousseau, oil on canvas, c. 1848

Giraudon—Art Resource/EB Inc

and 1849, respectively. They attracted a large following of landscape and animal painters, some coming to live at Barbizon, others visiting only infrequently; those who were to become most notable were Charles-François Daubigny, Narcisse-Virgile Diaz de La Peña, Jules Dupré, Charles Jacque, and Constant Troyon, all of whom had had indifferent success.

Each Barbizon painter had his own style and specific interests. Rousseau's vision was melancholy, concentrating on vast sweeps of

landscape and looming trees. Dupré's close-range, detailed scenes are suffused with foreboding. Daubigny favoured scenes of lush, verdant fields, and Diaz painted sun-dappled forest interiors. Troyon and Jacque painted placid scenes that featured livestock. Millet, the only major painter of the group for whom pure landscape was unimportant, made monumental paintings of peasants that celebrated the nobility of humble people living close to nature. All of these artists, in spite of their Romantic inspiration, emphasized the simple and ordinary rather than the terrifying and monumental aspects of nature. Unlike their English contemporaries, they had little interest in the surface effects of light and colour or in atmospheric variations. Instead, they emphasized permanent features, painting solid, detailed forms in a limited range of colours.

Having suffered for some time from a total lack of recognition, the Barbizon painters began to gain popularity by midcentury. Their success increased, most winning official recognition from the French Academy and receiving large prices for their paintings. Some of the Barbizon painters were masters of composition and description; others were less competent. But the historical importance of all of them is undeniable, for as a group they were instrumental in establishing pure, objective landscape painting as a legitimate genre in France.

Barbo, Pietro: see Paul II under Paul (papacy).

Barbon, Nicholas (b. c. 1640, London—d. 1698), English economist, widely considered the founder of fire insurance.

Barbon was probably the son of the sectarian preacher Praise-God Barbon. He studied medicine at the University of Leiden, received his M.D. at Utrecht in 1661, and became an honorary fellow of the College of Physicians in 1664. The considerable part that he took in the rebuilding of London after the Great Fire of 1666 apparently roused his interest in selling fire insurance, and about 1680 he set up an office in London for that purpose.

Barbon's writings on economics to some ex-

Praise-God Barbon, engraving

By courtesy of the trustees of the British Museum photograph, J.R. Freeman & Co. Ltd

spelled PRAISEGOD (b. c. 1596—d. 1679, London), English sectarian preacher from whom the Cromwellian Barebones Parliament derived its nickname.

By 1634 Barbon was becoming a prosperous leather seller and was attracting attention as the minister of a congregation that assembled at his own house, the "Lock and Key," on Fleet Street. His preaching, in which he advocated infant baptism, was attended by large audiences and was sometimes the occasion of riots. After Oliver Cromwell had dissolved the Long Parliament, Barbon was summoned by Cromwell to sit as a member for London in the new assembly of "godly" men who were nominated by the Independent congregations. This "Nominated Parliament" (July–December 1653), also derisively nicknamed the "Barebones Parliament," consisted predominantly of strict Puritans. Barbon himself played no significant role, though he did support radical legal reforms. In the 1650s he was active in the London Common Council.

Opposing the restoration of Charles II, Barbon presented in February 1660 a petition to Parliament deprecating any reconciliation with the Stuarts. He also circulated Marehamont Needham's pamphlet detailing anecdotes critical of Charles II's morals. After the Restoration (May 1660), Barbon publicly opposed the government and was imprisoned in the Tower of London (Nov. 26, 1661, to July 27, 1662) for his rashness.

Called a Brownist and an Anabaptist by his opponents, Barbon displayed in his writings a toleration unusual in a period of much acrimonious religious controversy.

Barbosa, Jorge (Vera-Cruz) (b. May 25, 1902, Praia, São Tiago, Cape Verde Islands—d. Jan. 6, 1971, Cova da Piedade), African poet who expressed in Portuguese the cultural isolation and the tragic nature of life on the drought-stricken Cape Verdean islands. In delicately phrased verse that became a model for later poets, he often praised the stoic endurance of a people caught in an inhospitable, forgotten land.

Barbosa spent his early years on the island of São Vicente, excluding his years of study in Lisbon. He resided for many years on the island of Sal, working as a civil servant of the customhouse. He was one of the three founders of the literary journal *Claridade* ("Clarity") in the 1930s, which marked the beginning of modern Cape Verdean literature. His poetry was published as *Arquipélago* (1935), *Ambiente* (1941; "The Circle"), and *Caderno de um Ilhéu* (1956; "An Islander's Notebook").

Barbotine ware, pottery decorated with a clay slip applied by means of a technique first employed on Rhenish pottery prior to the 3rd century AD. The slip was applied by piping, in the same way icing is applied to cakes. It was used to adorn the edges of flat dishes with such designs as small flowers. By the 3rd century it started to oust molded ornamentation.

Barbour, John, Barbour also spelled BARBERE, or BARBIER (b. 1325?—d. March 13, 1395, Aberdeen, Aberdeenshire, Scot.), author of a Scottish national epic known as *The Bruce*, the first major work of Scottish literature.

Records show that Barbour became archdeacon of Aberdeen while still a young man and in 1357 was granted a safe conduct by Edward III of England to study at Oxford. That same year he participated in the negotiations for ransoming King David II, who had been a prisoner in England after his capture in the Battle of Neville's Cross (1346). In 1364 and 1368 Barbour studied in France. Throughout his life he enjoyed royal favour and in 1388 was given a life pension.

Barbour completed *The Actes and Life of the most Victorious Conqueror, Robert Bruce King of Scotland*, a metrical historical romance in 20 books, in 1376. The background of *The Bruce* is the political history of the Scottish struggle for independence, from the death of Alexander III (1286) to the death of Douglas and the burial of Bruce's heart (1332). The story emphasizes the chivalry and idealism of the Scottish heroes and exhorts their successors to emulate "thair nobill elderis." But the Battle of Bannockburn (1314) was still within the memory of his contemporaries, and *The Bruce* remains a harshly realistic story of recent events in the style of the chansons de geste rather than a romance of chivalry. The style of the poem is vigorous, direct, and admirably suited to the matter. Barbour evidently took some trouble to collect firsthand accounts of the Battle of Bannockburn, which is the highlight of the poem. His narrative manner is similar to that of the Scottish border ballads.

Barbour, Philip P(endaleton) (b. May 25, 1783, Barboursville, Va., U.S.—d. Feb. 25, 1841, Washington, D.C.), associate justice of the United States Supreme Court (1836–41) and political figure known for his advocacy of states' rights and strict construction of the U.S. Constitution.

Barbour practiced law in Virginia from 1802 until he was elected to the state House of Delegates in 1812. Two years later he was sent to Congress. He served as speaker from 1821 to 1823, when he was defeated for the office by Henry Clay, and he then accepted an appointment to the General Court of Virginia. Barbour opposed the nationalistic policies of Clay and John C. Calhoun, including the tariff, internal improvements, and the extension of federal jurisdiction by the Supreme Court, and he fought to protect Virginia from federal encroachments. In 1827 he briefly returned to Congress to continue this battle and in 1829 took the place of the ailing James Monroe as president of the Virginia constitutional convention.

In 1830 Pres. Andrew Jackson appointed Barbour a federal district judge in Virginia; and in 1836, when Roger B. Taney became the chief justice, Barbour succeeded Justice Gabriel Duvall on the U.S. Supreme Court. His only major opinion was in *New York v. Miln* (1837), which upheld states' jurisdiction over certain commercial activities. Barbour was part of the post-John Marshall majority, led by Taney, which began to shift the emphasis of the court away from nationalism and liberal construction. Although highly regarded for his scholarship, Barbour did not serve long enough to have a great influence on the court's direction.

not letter by letter

Barbourville, city, seat of Knox county, southeastern Kentucky, U.S., on the Cumberland River, in the Cumberland Mountains,

and a gateway to the Daniel Boone National Forest. It was founded in 1800 and named for James Barbour, who donated land for the townsite. Union College was founded there by the Methodist Church in 1879. The Dr. Thomas Walker State Shrine, 6 mi (10 km) south, has a replica of the log cabin (the first house in Kentucky) built in 1750 by Walker, who explored the state and discovered the Cumberland Gap. Barbourville is an agricultural trading centre (tobacco, vegetables, sorghum) and has some light industry. A floodwall protects the city from the meandering Cumberland River. Pop. (1990) 3,658.

Barbudi (dice game): see Barbooth.

Barbusse, Henri (b. May 17, 1873, Asnières, Fr.—d. Aug. 30, 1935, Moscow), novelist, author of *Le Feu* (1916; *Under Fire*, 1917), a firsthand witness of the life of French soldiers in World War I. Barbusse belongs to an important lineage of French war writers who span the period 1910 to 1939, mingling war memories with moral and political meditations.

Barbusse, 1935
H. Roger-Viollet

Barbusse started as a neo-Symbolist poet, with *Pleureuses* (1895; "Mourners"), and continued as a neo-Naturalist novelist, with *L'Enfer* (1908; *The Inferno*, 1918). In 1914 he volunteered for the infantry, was twice cited for gallantry, and finally was discharged because of his wounds in 1917. Barbusse's *Le Feu*; *journal d'une escouade*, awarded the Prix Goncourt, is one of the few works to survive the proliferation of wartime novels. Its subtitle, *Story of a Squad*, reveals the author's double purpose: to relate the collective experience of the *poilus*'s (French soldiers') life in the trenches and to denounce war. The horror of bloodshed and destruction led Barbusse to an indictment of society as a whole. He became a pacifist, then a militant Communist and a member of international peace organizations. After *Clarté* (1919; *Light*, 1919), his literary production acquired a definite political orientation. His last work, *Staline* (1935; Eng. trans., 1935), was partly written in the Soviet Union, where he was living at the time of his death.

Barca (Libya): see Marj, al-.

Barca, Hamilcar, Barca also spelled BARCAS; see Hamilcar Barca.

barcarole, also spelled BARCAROLLE (from Italian *barcarola*, "boatman," or "gondolier"), originally a Venetian gondolier's song typified by gently rocking rhythms in $\frac{6}{8}$ or $\frac{12}{8}$ time. In the 18th and 19th centuries the barcarole inspired a considerable number of vocal and instrumental compositions, ranging from opera arias to character pieces for piano. The term surfaced as early as 1710, when the French composer André Campra included a "Fête des barquerolles" in a stage work (*Les Fêtes vénitienes*, 1710). Subsequently, operas by Giovanni Paisiello, Carl Maria von Weber, Daniel-François-Esprit Auber, Gioacchino Rossini,

Giuseppe Verdi, and Johann Strauss, among others, featured barcaroles.

Without question, the most famous operatic specimen is the Barcarolle from Jacques Offenbach's *Tales of Hoffmann*. Chopin's *Barcarolle*, Opus 60, is possibly the best known of the 19th-century compositions, although other 19th-century composers from Mendelssohn to Liszt and Gabriel Fauré contributed a host of similar pieces. Barcaroles for various performance media were written by Franz Schubert (voice and piano), Johannes Brahms (women's chorus), and Sir William Sterndale Bennett (piano and orchestra).

Barce (Libya): see Marj, al-.

Barcelona, province, in the autonomous community (region) of Catalonia, northeastern Spain, formed in 1833 from a number of districts stretching between the Pyrenees and the Mediterranean coast. Its area is 2,986 sq mi (7,733 sq km). The province follows the axis of the Río Llobregat basin, from which its regions are symmetrically arranged. No province has a more diverse landscape; it is a cross section of many varied geological zones, namely, the Pyrenees, the scarps and basins of the interior of Catalonia, the Serralada interior, the central depression, the Serralada del Mar, and the coastal plains.

The economy is as varied as the landscape. In the mountainous northern tableland near Berga, lignite is mined, and cement, of which the province is Spain's leading producer, is manufactured. Southwest, in the Cardona Valley, salt has been exploited since Roman times; and there are important potash deposits (discovered in 1912) near Suria. The fertile plains of Vich and Barcelona (around the provincial capital of Barcelona) yield grapes, as does the area around Vilafranca, in the south. Grains are cultivated throughout the central depression. The coastal plain area around the Llobregat river delta is Barcelona province's market garden, with more than 50,000 ac (20,200 ha) under intensive cultivation. Tourism is a growing economic concern because of the mild climate and the Mediterranean beaches.

Barcelona, long the principal Catalan province, is the heart of the greatest industrial concentration of Spain, and its main city is the

Monastery of Santa María de Montserrat, Barcelona province, Spain

J. Allan Cash from Rapho/Photo Researchers—EB Inc

chief seaport. It produces three-quarters of the textile manufactures and a high proportion of the output of the chemical and engineering industries. Exports include table and sparkling wines and manufactured goods. The province has utilized the hydroelectric power sources of the Pyrenees and its strategic location to good advantage. Pop. (1982 est.) 4,949,892.

Barcelona, city, seaport, and capital of Barcelona province and of Catalonia au-

onomous region, northeastern Spain. Located 90 miles (150 km) south of the French frontier, it is Spain's chief Mediterranean port and commercial centre and is famed for its great individuality, architectural and cultural richness, and physical beauty. Barcelona stands on a gentle mountain-ringed slope facing southeast to the Mediterranean Sea between the Besòs and Llobregat rivers. The city has a Mediterranean climate.

A brief treatment of Barcelona follows. For full treatment, see *MACROPAEDIA*: Barcelona.

Barcelona was likely founded by either the Phoenicians or the Carthaginians. It gained importance as a Roman port in the 3rd century AD and later became an important religious centre. Barcelona became a major trading city after the union of Catalonia and Aragon in 1137. Weakened by the plague in the 14th century, Barcelona declined into the 18th century.

Philip V ended Barcelona's political autonomy in 1714, after which the city prospered as a centre of textile manufacture. Industrialization helped make Catalonia Spain's wealthiest region, and economic strength encouraged a movement for regional autonomy.

Barcelona was a main centre of Republican strength during the Spanish Civil War (1936–39). During Francisco Franco's rule, Barcelona suffered, and the Catalan language was prohibited. In 1977 regional government was restored. Barcelona boomed economically during the late 20th century and hosted the 1992 Olympic Games.

The old town's main axis is the Ramblas, a series of spacious, tree-lined avenues leading north to the commercial centre, Plaça de Catalunya, and south to the Passeig de Colom and the seafront. To the north is the 19th-century Eixample ("Extension"), a mixed commercial and residential district. Industrial districts lie near the harbour and on the city's outskirts.

The city's oldest part is built on a small hill, Mount Taber. Fine Gothic buildings include the cathedral (built between 1289 and the late 15th century) and the Church of Santa Maria del Mar. Royal and episcopal palaces house the archives of the city and of the crown of Aragon. Monuments include a 197-foot (60-metre) column built as a tribute to Christopher Columbus and the Expiatory Temple of the Holy Family (Sagrada Família), the best-known work of the Catalan architect Antonio Gaudí. Begun in 1882 and still unfinished, this huge and elaborate church features spires that dominate the skyline.

The language of Catalonia, Catalan, has a long literary tradition and has deeply marked the political, social, and cultural history of the area. (See Catalan language; Catalonia.) The University of Barcelona (1450) and the Autonomous University of Barcelona (1968) are among the city's higher educational institutions. Libraries include the Library of Catalonia and the University Library. Outstanding museums include the National Museum of Art of Catalonia, the Museum of Modern Art, the Maritime Museum, and the Picasso Museum.

The service sector dominates Barcelona's economy, accounting for nearly four-fifths of all jobs. The city is a major financial and commercial centre, with an important stock exchange. Because of its port and excellent land transportation links to the north, it is also a major centre for warehousing and shipping.

Many manufacturers relocated in the late 20th century to the city's suburbs; the metropolitan area as a whole remains one of Spain's most important industrial regions. Major industries include automobiles, food processing, metalworking, chemicals, pharmaceuticals, and the manufacture of appliances, electronics, textiles, and clothing.

The city's transportation system includes subways, tunnels, buses, cable cars, railways,

and freeways. There is an international airport at Prat del Llobregat. Area city, 38 square miles (98 square km). Pop. (1996 est.) city, 1,508,805; metropolitan area, 2,904,941.

Barcelona, city, capital of Anzoátegui *estado* ("state"), northeastern Venezuela. On the Neveri River, 3 miles (5 km) from the Caribbean Sea and about 200 miles (320 km) east of Caracas, it lies in the Barcelona Gap, through which the Llanos (plains) extend from the interior to the sea. Barcelona is the commercial centre of an industrial complex that includes neighbouring Puerto la Cruz, the main outlet for the important oil fields nearest the northern Venezuelan coast. It is also a shipping centre for cattle and for coffee grown in the high interior valleys. The nation's principal coalfields are nearby. Pop. (2000 est.) 311,475.

Barcelona chair, one of the finest and most elegant chairs of the 20th century. It was designed by Mies van der Rohe for the German Pavilion, which he also designed, at the International Exposition in Barcelona in 1929.

Barcelona chair, designed by Mies van der Rohe, Germany, 1929; in the Museum of Modern Art, New York City

The framework consists of two connected pairs of crossed chrome-plated steel bars: the single curve of the back continues into the front legs, and the rear legs cross these to form a double curve supporting the seat. In the seat and back, leather straps support foam-rubber cushions covered with buttoned leather.

barchan, also spelled BARKHAN, crescent-shaped sand dune produced by the action of wind predominately from one direction. One of the commonest types of dunes, it occurs in sandy deserts all over the world.

Barchans are convex facing the wind; the horns of the crescent point downwind and mark the lateral advancement of the sand. These dunes are markedly asymmetrical in cross section, with a gentle slope facing toward the wind and a much steeper slope facing away from the wind. Barchans may be 9–30 m (30–100 feet) high and 370 m (1,214 feet) wide at the base measured perpendicular to the wind. They gradually migrate with the wind as a result of erosion on the windward side and deposition on the leeward side. The rate of migration ranges from about a metre to a hundred metres per year. Barchans usually occur as groups of isolated dunes and may form chains that extend across a plain in the direction of the prevailing wind.

Barchans are characteristic of open, inland desert regions such as Turkistan, where the name originated. The Russian naturalist Alexander von Middendorf is credited with introducing the word into scientific literature in 1881.

Barclay, Alexander (b. c. 1476—d. June 10, 1552, Croydon, Surrey, Eng.), poet who won contemporary fame chiefly for his adaptation

of a popular German satire, *Das Narrenschiff*, by Sebastian Brant, which he called *The Ship of Folly of the Worlde* (first printed 1509).

Barclay, possibly of Scottish birth, was by 1509 a chaplain at the College of St. Mary Ottery, Devon. He later became a Benedictine monk at Ely and still later a Franciscan friar of Canterbury. He presumably conformed to Protestantism, however, for after the Refor-

Alexander Barclay (kneeling), woodcut from the frontispiece of the *Mirror of Good Manners*, 1523

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd.

mation he retained livings (benefices) in Essex and Somerset held since 1546. In 1552 he became rector of All Hallows, London.

Barclay also wrote (probably while a monk at Ely) the first formal eclogues in English, filled with entertaining pictures of rural life.

Barclay, John (b. Jan. 28, 1582, Pont-à-Mousson, near Nancy, Fr.—d. Aug. 15, 1621, Rome [Italy]), Scottish satirist and Latin poet whose *Argenis* (1621), a long poem of romantic adventure, strongly influenced the development of the romance in the 17th century.

Barclay was a cosmopolitan man of letters who traveled freely between Paris and London. He remained in London from about 1606 until 1616 as a minor court official, then settled permanently in Rome.

Barclay's *Euphormionis Lusinini Satyricon* (1603–07)—a severe satire on the Jesuits, the medical profession, and contemporary scholarship, education, and literature—is an urbane and facile mixture of prose and verse. Filled with villains and rogues, it contributed to the later development of the picaresque novel. Barclay's most celebrated work was the *Argenis*, an outstanding example of modern Latin verse. Its

John Barclay, engraving by Claude Mellan

political implications were so marked that many editions included a key to the characters and names. It was reprinted more than 50 times during the 17th century, and literary figures such as Samuel Taylor Coleridge and Jean-Jacques Rousseau were familiar with the text.

Barclay, Robert (b. Dec. 23, 1648, Gordonstoun, Moray, Scot.—d. Oct. 3, 1690, Ury, Aberdeen), Quaker leader whose *Apology for the True Christian Divinity* (1678) became a standard statement of Quaker doctrines. His friendship with James II, then duke of York, helped obtain the patent to settle the province of East Jersey, in the New World.

After returning to Scotland from his education in Paris, Barclay joined the Society of Friends (Quakers) in 1666. For a public debate at Aberdeen in 1675, he published *Theses Theologicae*, a set of 15 propositions of the Quaker faith. To amplify them further, he published the *Apology* three years later. This early and enduring exposition of Quaker beliefs defined Quakerism as a religion of the "inner light." Arguing against both Roman Catholicism and traditional Protestantism, including Anglicanism, Barclay asserted that neither the church nor the Scriptures could claim completeness or ultimate authority and that both were secondary to the work of the Holy Spirit—the Inner Light—in the believer.

In 1677 Barclay and other Quaker leaders, including William Penn (1644–1718), visited Holland and northern Germany to promote the Quaker movement. Repeatedly imprisoned and persecuted at home, Barclay and Penn found a friend in the Duke of York. Their influence with him helped secure a patent for themselves and 10 other society members to settle in that area of present-day New Jersey then called East Jersey (not to be confused with the area in present Pennsylvania where Penn founded Philadelphia). The group emigrated to America in 1682. After serving from 1682 to 1688 as nominal governor of East Jersey, Barclay returned to Scotland and died at his estate at Ury.

Barclay de Tolly, Mikhail Bogdanovich, Knyaz (Prince) (b. Dec. 13 [Dec. 24, New Style], 1761, Pamuskis, Poland-Lithuania [now Zeimys, Lithuania]—d. May 14 [May 26], 1818, Insterburg, East Prussia [now Chernyakhovsk, Russia]), Russian field marshal who was prominent in the Napoleonic Wars.

Barclay was a member of a Scottish family that had settled in Livonia in the 17th century. Entering the Russian army in 1786, he served against Turkey (1788–89), Sweden (1790), and Poland (1792–94). In the campaign of 1806–07 against Napoleon, Barclay distinguished himself in the Battle of Pultusk and was wounded in the Battle of Eylau, after which he was made lieutenant general. In 1808–09 he commanded Russian forces against the Swedes in Finland. From 1810 to 1812 he was Russian minister of war.

In 1812 Barclay took command of one of two Russian armies operating against Napoleon. His strategy of avoiding decisive action and retreating into Russia proved unpopular, and he was forced to resign his command in favour of General M.I. Kutuzov, who followed the same strategy.

Barclay was present at the Battle of Borodino, left the army soon afterward, and was recalled in 1813 for service in Germany. After the Battle of Bautzen he was made commander in chief of the Russian forces, and after the Battle of Leipzig he received the title of count from the emperor Alexander I. Barclay took part in the invasion of France in 1814 and while in Paris was promoted to field marshal. In 1815 he was commander in chief of the Russian army that invaded France after Napoleon's return from Elba. He was made a prince at the end of that campaign.

Barclays Bank PLC, British banking and trust firm registered July 20, 1896, under the name Barclay & Co. Ltd. and assuming the name Barclays Bank Ltd. in 1917. It was converted into a public limited company in 1981. The largest commercial banking concern in the United Kingdom, Barclays Bank operates

about 5,000 offices in England and Wales and overseas and has several subsidiaries in Britain and other countries. The group's overseas business is managed by Barclay Bank International Ltd., which has some 2,000 offices in over 70 countries. The firm's headquarters are in London.

The bank, as created in 1896, merged the banking business of Barclay, Bevan, Tritton, Ransom, Bouverie & Co., Gurney & Co., and various other private banking concerns. Over the years it took over several other banks, mostly in Britain but also in Commonwealth nations, continental Europe, and other areas. In 1979 Barclays purchased American Credit Corporation and changed the name of that institution to Barclays American Corporation. Through this subsidiary, the bank embarked on a program of significant expansion in the United States in the early 1980s, purchasing numerous consumer finance companies and trust company operations.

Barclay Bank International Ltd.—called Barclays Bank D.C.O. until 1971 and Barclays Bank (Dominion, Colonial and Overseas) until 1954—was created in 1925 in the amalgamation of Colonial Bank, Anglo-Egyptian Bank, and National Bank of South Africa and became a wholly owned subsidiary of Barclays Bank Ltd. in 1971. The Colonial Bank had been founded in 1836 to carry on business in the West Indies and British Guiana and had been empowered by special acts of 1916–17 to conduct business anywhere in the world. The Anglo-Egyptian Bank had been created in 1864 to do business in Alexandria and, later, elsewhere in the Mediterranean, as in Malta. De Nationale Bank der Zuid-Afrikaansche Republiek (Beperkt) had been incorporated in the Boer republic in 1890 and renamed the National Bank of South Africa Limited in 1902, after British occupation.

Barcoo River (Australia): see Cooper Creek.

bard, in the original meaning, a Celtic composer of eulogy and satire; more generally, a tribal poet-singer gifted in composing and reciting verses on heroes and their deeds. As early as the 1st century AD, the Latin author Lucan referred to bards as the national poets or minstrels of Gaul and Britain. In Gaul the institution gradually disappeared, whereas in Ireland and Wales it survived. The Irish bard through his chanting has preserved a tradition of poetic eulogy. In Wales, where the word bard has always been used for poet, the bardic order was codified into distinct grades in the 10th century. Despite a decline of the order toward the end of the European Middle Ages, the Welsh tradition has persisted and is celebrated in the annual eisteddfod (*q.v.*), a national assembly of poets and musicians.

Bardanes: see Philippicus Bardanes.

Bardeen, John (b. May 23, 1908, Madison, Wis., U.S.—d. Jan. 30, 1991, Boston, Mass.),

Bardeen

By courtesy of University of Illinois at Urbana—Champaign

American physicist who was co-winner of the Nobel Prize for Physics in both 1956 and 1972. He shared the 1956 prize with William B. Shockley and Walter H. Brattain for their joint invention of the transistor. With Leon N. Cooper and John R. Schrieffer he was awarded the 1972 prize for development of the theory of superconductivity.

Bardeen earned bachelor's and master's degrees in electrical engineering from the University of Wisconsin (Madison) and obtained his Ph.D. in 1936 in mathematical physics from Princeton University. A staff member of the University of Minnesota, Minneapolis, from 1938 to 1941, he served as principal physicist at the U.S. Naval Ordnance Laboratory in Washington, D.C., during World War II. After the war he joined Bell Telephone Laboratories, Inc., where he did research on the electron-conducting properties of semiconductors. This work led in 1947 to the invention of the transistor, which replaced the bulkier vacuum tube in many applications and ushered in the age of microminiature electronic parts.

Bardeen was a professor of electrical engineering and physics at the University of Illinois, Urbana, from 1951 to 1975. The theory of superconductivity that is now called the BCS theory (from the initials of Bardeen, Cooper, and Schrieffer) was first advanced in 1957; all later theoretical work in superconductivity is based upon it. Bardeen was also the author of a theory explaining certain properties of semiconductors.

Bardanes, also called BARDAISAN, or BARDAIŠĀN (b. July 11, 154, Edessa, Syria, [now Urfa, Tur.]—d. c. 222, Edessa), a leading representative of Syrian Gnosticism. Bardanes was a pioneer of the Christian faith in Syria who embarked on missionary work after his conversion in 179.

His chief writing, *The Dialogue of Destiny, or The Book of the Laws of the Countries*, recorded by a disciple, Philip, is the oldest known original composition in Syriac literature. Bardanes attacked the fatalism of the Greek philosophers after Aristotle (4th century BC), particularly regarding the influence of the stars on human destiny. Mingling Christian influence with Gnostic teaching, he denied the creation of the world, of Satan, and of evil by the supreme God, attributing them to a hierarchy of deities.

Aided by his son Harmonius, Bardanes wrote many of the first Syriac hymns to popularize his teachings. Their literary value earned for him renown in the history of Syriac poetry and music.

Bardhamān (India): see Burdwān.

Bardi FAMILY, an aristocratic Florentine family that successfully developed its financial and banking company to become one of the most influential European business powers between 1250 and 1345.

By coordinating its political activity with its financial interests, the Bardi became the leading Florentine merchant house. Along with many other Florentine aristocratic families, their power was curtailed somewhat by ordinances of 1293 and 1295. Despite the loss of several estates in 1341, the family retained its prominent political position, until unwise financial ventures, including support of Edward III (king of England 1327–77) in the Hundred Years' War against France (1337–1453) and aid to Florence in a war with the rival city of Lucca, caused the bankruptcy of the Bardi's banking house in 1345. This bankruptcy provoked resounding financial repercussions in Florence and Europe and deprived the Bardi of their political power.

Bardi, Giovanni, CONTE (count) DI VERNIO (b. Feb. 5, 1534, Florence—d. 1612, Flor-

ence), musician, writer, and scientist, influential in the evolution of opera. In about 1580 he founded the Florentine Camerata, a group that sought to revive ancient Greek music and drama and whose participants composed the earliest operas. Among the members were the poet Ottavio Rinuccini, the theorist Vincenzo Galilei (father of Galileo), and the composers Giulio Caccini, Jacopo Peri, and Emilio del Cavaliere, with most of whom Bardi collaborated in court entertainments from 1579 to 1608.

Bardi's *Discorso mandato a Caccini sopra la Musica Antica* (1580; "Discourse to Caccini on Ancient Music") develops ideas similar to those of Caccini and Galilei: counterpoint obscures the words in musical settings and should be abandoned; music should consist of a single vocal line, lightly accompanied, exactly reflecting the rhythm and intonation of speech. These theories underlie the musical style of the early Florentine operas. Ironically, Bardi's only surviving compositions are two highly contrapuntal madrigals.

Bardi also belonged to the Accademia della Crusca, a literary association, and in 1592 he became a chamberlain to Pope Clement VIII.

Bardiya (king of Persia): see Smerdis.

Bardo, Treaty of, also called TREATY OF AL-QAṢR AS-SA'ID, or TREATY OF KASSER SAID (1881), agreement that established France's protectorate over Tunisia. A French expeditionary force of 36,000 men was sent to Tunisia in 1881 at the urging of the French foreign minister, Jules Ferry, ostensibly to subdue attacks of the Tunisian Kroumer tribe on the Algerian frontier. The French met little resistance from the bey, Muḥammad as-Sadiq, and on May 12, 1881, a treaty was concluded, authorizing indefinite French military occupation, restricting the bey's authority to domestic affairs, stipulating a reorganization of Tunisian finances, and providing for a French minister resident, who would act as liaison between French and Tunisian authorities.

Bardsey Island, Welsh YNYS ENLLI, small island (0.7 square miles [1.8 square km]) off the tip of the Llyn Peninsula, Dwyfor district, Gwynedd county, Wales. It is separated from the mainland by a channel 2 miles (3 km) wide that has a strong tidal race. On this naturally protected site the earliest religious house in Wales was founded by the Celtic St. Cadfan in the early 6th century and was later superseded by an Augustinian abbey. A place of pilgrimage in the European Middle Ages and later a haunt of pirates, it is now a major British bird nature reserve.

Bardstown, city, seat of Nelson county, in the outer Bluegrass region of central Kentucky, U.S., 39 miles (63 km) southeast of Louisville. Founded as Salem in 1778, it was later renamed to honour William Baird (Bard), one of the original landowners. During the American Civil War it was occupied (September 1862) by General Braxton Bragg's Confederate forces. The city is the trade centre for a fertile agricultural area (tobacco, grain, livestock, and dairy products); its manufactures include bourbon whiskey, flour, and lumber. St. Joseph's Cathedral (1819), the oldest Roman Catholic cathedral west of the Alleghenies, is in the city. Nearby is "Federal Hill" (1795), a Georgian house preserved as a shrine within a state park, where Stephen Foster is said to have composed the song "My Old Kentucky Home." Also nearby are Wickland (1813), home of three Kentucky governors; the Trappists' Abbey of Our Lady of Gethsemane (founded 1848); the Barton Museum of Whiskey History; and Bernheim Forest. Inc. 1788. Pop. (1990) 6,801.

bareback bronc-riding, rodeo event in which a cowboy attempts to ride a bucking horse (bronco) for a specified time (usually eight seconds). The horse is equipped only with a surcingle—a rope belt about its midsection—which the rider may grip with one hand only. The rider must have his spurs in contact high on the horse's shoulders to begin the event.

Bareback rider trying to ride bucking horse
E. W. Marugg Photography

and he is disqualified if he is thrown off, touches the horse with his free hand, or allows the surcingle to slip off the horse. Horse and rider are scored separately for their performance, and the rider with the highest total is the winner.

Barebone, Praise-God, Barebone also spelled BAREBONES: see Barbon, Praise-God.

Barebones Parliament, also called LITTLE, or NOMINATED, PARLIAMENT (July 4–Dec. 12, 1653), a hand-picked legislative group of "godly" men convened by Oliver Cromwell following the Puritan victory in the English Civil Wars. Its name was derived from one of its obscure members, Praise-God Barbon.

After Cromwell expelled the Rump Parliament (April 20, 1653), he prompted the army council to dispatch letters to the Congregational churches inviting suggestions of fit persons to sit in a new assembly. From the names submitted, the council chose 140 members—129 for England, 5 for Scotland, and 6 for Ireland. On July 4 the delegates met, assuming by a resolution of July 6 the name of Parliament. The zeal of this Nominated Parliament for reform, however, threatened to confuse rather than settle the war-weary nation. On December 12, conservative members of the Parliament accused their radical opponents of destroying the clergy, the law, and the property of the subject and, by a surprise motion, resolved upon the abdication of the Parliament. The majority thereupon waited on Cromwell and laid their resignation before him, while the recalcitrant minority was expelled from the house by the military. On the following day, General John Lambert produced the "Instrument of Government," which after two days' discussion established the system of Protectorate government that lasted until May 1657.

Bareilly, city, central Uttar Pradesh state, northern India, on the Rāmganga River. Founded in 1537, the city was built largely by the Mughal governor Makrand Rāy. It later became the capital of the Rohillas, a migrant clan that gained control of the surrounding territory. In 1774 the ruler of Oudh conquered the area with British aid, and Bareilly was ceded to the British in 1801. It was a centre of the 1857 Indian Mutiny against British rule. Situated at a major rail and road junction, it is a trade centre for agricultural products and has a number of industries (sugar processing, cotton ginning and pressing). Bareilly is the site of Rohilkhand University (1975) and Bareilly College (1837), and the Indian Veterinary Research Institute is in the suburb of Izatnagar.

Bareilly has many fine mosques. The ancient fortress city of Ahicchatrā near Bareilly is believed to have been visited by the Buddha. Pop. (1991 prelim.) city, 583,473; metropolitan area, 607,652.

Barenboim, Daniel (b. Nov. 15, 1942, Buenos Aires, Arg.), Israeli pianist and conductor. Barenboim's parents were both pianists (his father, Enrique Barenboim, was also a noted music professor), and the family moved from Argentina to Salzburg, Austria, when Daniel was nine and then on to Israel in 1952. Barenboim had already debuted as a pianist at age seven and in Europe became known as something of a child prodigy. He made his debut in London (with the Royal Philharmonic) in 1956 and in the United States (at Carnegie Hall) in 1957. He became especially known for his somewhat colourful interpretations of W.A. Mozart, Ludwig van Beethoven, and other Classical and Romantic composers.

Barenboim started conducting professionally in 1962, first in Israel and then in Australia, with the Melbourne and Sydney symphony orchestras. He thereafter was guest conductor in several cities in Europe, Israel, and the United States. He frequently toured with the English Chamber Orchestra. In 1987 he signed to become musical and artistic director of the new Bastille Opera in Paris; but, after assembling a team of musicians, singers, designers, and other personnel, he fell into disputes with representatives of the socialist government in Paris and was dismissed (in January 1989) before the first season was to commence, in 1990. Almost immediately, in January 1989, he was offered the musical directorship of the Chicago Symphony Orchestra to succeed Sir Georg Solti beginning with the 1991–92 season.

Barents, Willem (b. c. 1550—d. June 20, 1597, the Arctic), Dutch navigator who searched for a northeast passage from Europe to Asia and for whom the Barents Sea was named. Because of his extensive voyages, accurate charting, and the valuable meteorological data he collected, he is regarded as one of the most important early Arctic explorers.

In 1594 he left Amsterdam with two ships and reached the west coast of Novaya Zemlya, which he followed northward until forced to turn back near its northern extremity. In the following year he commanded another expedition, of seven ships, which made for the strait between the Asian coast and Vaigach Island but was too late to find open water. On a third voyage (1596), he sighted Spitsbergen (now Svalbard), but upon rounding the north of Novaya Zemlya his ship became trapped in ice, and Barents was compelled to winter in the north. He lived only a week after he and his party were able to leave in open boats. The Arctic dwelling in which the party had wintered was found in 1871; many of its relics are preserved at The Hague, Neth. In 1875 a portion of his journal was found.

Barents Sea, Norwegian BARENTSHAVET, Russian BARENTSEVO MORE, outlying portion of the Arctic Ocean 800 miles (1,300 km) long and 650 miles (1,050 km) wide and covering 542,000 square miles (1,405,000 square km). Its average depth is 750 feet (229 m), plunging to a maximum of 2,000 feet (600 m) in the major Bear Island Trench. It is bounded by the archipelagoes of Svalbard and Franz Josef Land (north), the Norwegian and Russian mainland (south), the Novaya Zemlya archipelago (east), and by the conventional border with the Greenland Sea (west), which runs from Spitsbergen to Norway's northernmost tip, North Cape, via Bear Island (Bjørnøya).

The sea was known to Vikings and medieval Russians as the Murmean Sea. It first appeared under its modern name in a chart published in 1853, honouring a 16th-century

Dutch seeker of a northeast passage to Asia, Willem Barents.

The Barents Sea covers a relatively shallow continental shelf fringing the Eurasian landmass. The floor—covered by sands, silts, and a sandy-silt mixture—is cut from east to west by the major Bear Island Trench and the smaller South Cape, Northern, and Northeastern trenches. The Central and Perseus elevations provide shallower relief in the north, and there are fishing banks and shallows to the southeast. Also in the southeast is Kolguyev Island. The western mainland coast is abruptly elevated and pierced by fjords, while east of the Kanin Peninsula the coast is low-lying, with a number of shallow bays and inlets. The coasts of the northern archipelagoes are steep and high, with glaciers plunging down to the sea and accumulations of glacier-carried debris in the hollows.

The climate is subarctic, with winter air temperatures averaging -13°F (-25°C) in the north and 23°F (-5°C) in the southwest; summer averages in the same regions are, respectively, 32°F (0°C) and 50°F (10°C). Annual precipitation is 20 inches (500 mm) in the south but only half that in the north.

The North Cape and Spitsbergen branches of the Norway Current bring warm currents into the sea, but heat is lost in mixing with colder waters. Despite the high salinity (34 parts per 1,000), ice forms in winter, but fields are thin and icebergs do not linger long. In summer, the edge of the ice retreats far to the north. The tidal amplitude and current direction varies greatly. Ice-free ports are Murmansk and Teribyorka (Russia) and Vardø (Norway).

Fishing flourishes. Microscopic forms of phytoplankton feed deep-sea invertebrates, small, shrimplike crustaceans, bivalves, and sponges, which in turn support such fish as cod, herring, salmon, plaice, and catfish. There are also sea mammals (seals and whales), land mammals (polar bears and Arctic foxes), sea gulls, and, in warm weather, ducks and geese. Underwater flora is very rich in the shallow southern regions; and brown, red, and green algae are widespread. Most of the coastline is rock and stone, but about 20 to 40 percent contains shrubs, mosses, and lichens. Grasses are rare.

Barère (de Vieuzac), Bertrand (b. Sept. 10, 1755, Tarbes, Fr.—d. Jan. 13, 1841, Tarbes), a leading member of the Committee of Public Safety that ruled Revolutionary France during the period of the Jacobin dictatorship (1793–94); his stringent policies against those suspected of royalist tendencies made him one of the most feared revolutionaries.

Reared in a middle-class family of lawyers and ecclesiastics, Barère studied law at the University of Toulouse and in 1777 became a magistrate at Tarbes. Traveling to Paris in 1788, he came into contact with liberal and republican ideas and came to support suppression of local *parlements* and the creation of a popular national assembly.

In 1789 Barère helped draw up the cahier (a list of grievances demanding the abolition of feudal rights) of Bigorre, Tarbes, for which he served as deputy to the States General. By autumn 1789 he had joined the Club of the Jacobins and was serving on the Committee on Domains, organized to dispose of crown property. Prominent in Paris by 1790, he supported Robespierre and espoused a larger role for the Revolutionary government in 1791. After the mob attack on the Tuileries Palace, he was in agreement with the imprisonment of King Louis XVI, and by 1793 he was an outspoken regicide. In January 1793 he made his "Report to the French Nation," supporting nationalism and war against the royalist powers of Europe as an extension of revolutionary principles. His political power reached its apex when he helped found the first Committee of

Public Safety in April 1793, was elected its secretary, and formulated much of its propaganda on the "aristocratic conspiracy." By August he supported the confiscation of émi-

Barère, engraving by Louis-François Mariage, early 19th century, after a drawing by François Bonneville. By courtesy of the Bibliothèque Nationale, Paris

grés' estates, the expulsion of all Bourbon princes, the decree for mass conscription and a national army, and the Committee's policy of absolute economic and diplomatic control. The following spring he was appointed head of cultural propaganda.

After Robespierre's execution in July 1794, Barère's popularity diminished rapidly, and his arrest and deportation were ordered in 1795, although he escaped to Bordeaux. In 1799 Napoleon granted him amnesty and in 1803 made him "reporter of public opinion," but, after the First Restoration of the Bourbon monarchy (1814), he shifted his loyalties to the crown. Elected deputy during Napoleon's Hundred Days, he was placed on the police list after the Second Restoration in 1815 and was forced to flee to Belgium. He returned to Paris in 1830 and was elected to the general council of the Hautes-Pyrénées in 1833.

Barère's *Mémoires* were published in four volumes in 1842–44.

BIBLIOGRAPHY. Leo Gershoy, *Bertrand Barère: A Reluctant Terrorist* (1962), offers a reassessment of Barère's life and thought, based on his letters, speeches, and memoirs.

Bārfurush (Iran): see Bābol.

Barge Canal (New York, U.S.): see New York State Barge Canal.

bargeboard, also called VERGEBBOARD, exposed board or false rafter running underneath the slopes of a projecting gable roof. Such a board is often richly decorated with carved, cut-out, or painted designs and patterns, particularly in late medieval Europe, in Tudor

Gothic Revival style bargeboard on the New York Yacht Club House (currently in Mystic, Conn., U.S.), by Alexander Jackson Davis, 1846

England, and in 19th-century Gothic Revival architecture in England and the United States.

Bargello Museum, formally NATIONAL MUSEUM OF THE BARGELLO, Italian MUSEO NAZIONALE DEL BARGELLO, art museum housed in the Palazzo del Bargello (or del Podestà), Florence, Italy, which dates from the 13th and 14th centuries. The museum was established in 1865 and is especially famous for its collection of Renaissance sculpture, including works by Donatello, Michelangelo, Antonio del Pollaiuolo, Jacopo Sansovino, and Andrea del Verrocchio.

There is also a collection of some decorative arts, with displays of ivories, bronzes, majolica, medals, textiles, arms, and armour. The collection includes works by Luca Della Robbia and Benvenuto Cellini.

bargello work, also called FLORENTINE CANVAS WORK, kind of embroidery exemplified in the upholstery of a set of 17th-century Italian chairs at the Bargello Museum in Florence and practiced from the 17th century until modern times. It consists of flat vertical stitches laid parallel with the canvas weave rather

Bargello, or Florentine, work, detail of an American needlepoint upholstery, c. 1725; in the Metropolitan Museum of Art, New York City

than crossing the intersections diagonally as in most canvas stitches. These stitches, in gradating tones of the same colour or in contrasting colours, are arranged in a wavy zigzag pattern. The characteristic stitch is variously called Florentine, cushion, or, in allusion to the flamelike gradation of colour, flame stitch; its 17th-century name was Hungarian stitch.

Bargest (folklore): see Barghest.

Barghash (ibn Sa'īd) (b. c. 1834—d. March 27, 1888, Zanzibar [now in Tanzania]), sultan of Zanzibar (1870–88), a shrewd and ambitious ruler, who, for most of his reign, looked to Britain for protection and assistance but eventually saw his domains divided between Germany and his former protector.

Although not the first heir to the throne of his father, Sa'īd ibn Sultān, Barghash had made plans to seize the throne at his father's death in 1856; he was, however, forestalled by the rightful heir, his brother Mājid, and spent two years in exile in Bombay. Shortly after Barghash came to power (1870), his longtime friend John Kirk became British consul. Kirk, a strong advocate of British support of Zanzibar, forced Barghash to sign an antislavery treaty in 1873 and two further proclamations in 1876 to close additional slave-trade loopholes. The British government (despite Kirk's recommendations) was not prepared to support actively the extension of Barghash's authority in the interior, but British pressure did discourage Egyptian expansion along the East African coast in 1875.

Recognizing his political and military weakness, Barghash afterward looked to Britain both as a protector and as a source of technical and military aid. In the following years, with British help, he created a small but modern army and attempted to modernize his government. By 1882, however, he recognized

the threat posed by Belgian King Leopold II's determination to control the rich ivory trade of the Congo basin. At first Barghash tried to prevent that control by supporting the state-building efforts of the Arab trader Tippu Tib. But when Leopold's claims had been recognized by other European powers in 1885 and Germany was claiming most of present-day Tanzania, the disillusioned Barghash had no choice but to acquiesce in the dismemberment of his kingdom late in 1886.

Barghawāṭah, Berber tribal confederation that created a religio-political state in Morocco (8th–12th century). The Barghawāṭah, members of the Maṣmūdah family inhabiting the plain between the Moya Atlas and the Atlantic, had joined the Miknāsah and Ghumārah Berbers in the Khārījite revolt against the Umayyad caliph in 740–742, seizing Tangier and defeating Umayyad armies from Spain in the Battle of the Nobles (740). Shortly afterward the rebellion was suppressed, but a new leader, Ṣāliḥ ibn Ṭarīf, emerged in 748–749 among the Barghawāṭah and presented himself as a prophet, teaching a mixture of Islāmic, pagan, and astrological beliefs. His successors propagated this doctrine throughout the confederation. In the reign of Abū Ghufayl (885–913) the confederation became firmly established in Barghawāṭah territory and aided in the creation of a highly defensive state that also proved to be commercially prosperous.

By the mid-10th century the Barghawāṭah were influential enough to maintain diplomatic relations with the Umayyads of Córdoba, despite the heretical beliefs of the Berbers and the rigid orthodoxy of the Muslim court. Relations between the two powers were strained by the century's end, however, and the Barghawāṭah were beset by two invasions from Spain (977–978; 998–999) and an attack by an agent of the Fāṭimids from the east (982–983). The Barghawāṭah successfully met these incursions but, in the 11th century, were conquered by their Berber neighbours, the Banū Ifran, allies of the Umayyads. The Almoravid invasion followed in 1059, and, though the Barghawāṭah killed the Almoravid spiritual leader 'Abd Allāh ibn Yāsīn in battle, they themselves were soundly defeated. The remaining Barghawāṭah did not survive the Almoravid assault and disappeared after their defeat in 1148–49.

Barghest, also spelled BARGUEST, or BARGEST, in folklore of northern England (especially Yorkshire), a monstrous, goblin dog, with huge teeth and claws, that appears only at night. It was believed that those who saw one clearly would die soon after, while those who caught only a glimpse of the beast would live on, but only for some months. The Demon of Tidworth, the Black Dog of Winchester, the Padfoot of Wakefield, and the Barghest of Burnley are all related apparitions. Their Welsh counterparts were red-eyed Gwyllgi, the

Dog of Darkness, and Cwn Annwn, the Dogs of Hell. In Lancashire the monster was called Trash, Skriker, or Striker; its broad, sometimes backward-pointing feet made a splashing noise, and it howled horribly. In East Anglia, where it was thought to be amphibious, the dog had only one eye and was known as Black Shuck, or Shock. It was called Mauthe Doog on the Isle of Man. The Manchester Barghest was said to be headless.

bargueño (cabinet): see vargucno.

Barguzinsky Nature Reserve, natural area set aside for research in the natural sciences, extending from the northeastern shore of Lake Baikal to the western slopes of the Barguzinsky Mountains, southeastern Russia. The reserve was established (1916) to protect the habitat of the Barguzin sable and has an area of 650,380 acres (263,200 hectares). It covers 37 miles (60 km) of the Lake Baikal shoreline and adjacent lake waters, and part of the summit ridge of the Barguzinsky Mountains. The mountainous section is dissected by glacial cirques and lakes. Vegetation near the shore of Lake Baikal includes larch and rhododendron. At higher elevations there are taigas of cedar, larch, and fir. The upper elevations are dominated by tundra and lichen-covered rocks and cliffs. Wildlife includes pika, Siberian chipmunk, fox, elk, reindeer, brown bear, stoat, weasel, otter, moose, wolverine, Baikal hair seal (abundant along the lake shore), and musk and red deer. White-tailed eagle, ptarmigan, grouse, oriental cuckoo, warbler, and tit are the main bird species in the park.

Bari, people living near Juba in the southern Sudan. They speak an Eastern Sudanic language of the Chari-Nile branch of the Nilo-Saharan family. They live in small villages scattered across the hot, dry, flat countryside in the Nile valley. Their staple crop is millet, and they also keep cattle. Their culture and language are shared by many other small tribes in the region, most important of these being the Kakwa, Mondari, Kuku, Fajulu, Nyangbara, and Nyepu.

The Bari are divided into freemen and serfs. Blacksmiths, professional hunters, and similar groups form inferior castes. Most of the 150 patrilineal clans are composed of freemen. Both men and women undergo initiation by the extraction of the lower incisors and by scarring. Men then enter age sets that have distinctive names and ornaments. The people have many "big men" rather than a single chief. These include ritual functionaries, the rainmakers, who are few in number but extremely powerful, and the "fathers of the earth," who are responsible for magic to ensure successful cultivation, hunting, and warfare. Both these offices are hereditary. The Bari believe in a god who has two aspects: a benevolent god who dwells in the sky and produces rain and a malevolent god who lives in the earth and is associated with cultivation. Sacrifices are made to the spirits of the dead.

Bari, ancient (Latin) BARIUM, city, capital of Bari *provincia* and of Puglia (Apulia) *regione*, southeastern Italy. It is a port on the Adriatic Sea, northwest of Brindisi. The site may have been inhabited since 1500 BC. Greek influence was strong, and under the Romans, who called it Barium, it became an important port, the harbour being mentioned as early as 180 BC. Fishing was also significant in Roman times. A Saracen stronghold in the 9th century AD, the city became the seat of the Byzantine governor of Apulia in 885. It was captured for the Normans by Robert Guiscard in 1071. Peter the Hermit preached the First Crusade there in 1096, and a large party of crusaders embarked from its port. Razed by William the Bad of Sicily in 1156, Bari acquired new greatness under Emperor Frederick II (reigned 1220–50). An independent

San Nicola Basilica, Bari, Italy
SCALA—Arl Resource

duchy under a succession of rulers from the 14th century, it passed from the Sforza family to the kingdom of Naples in 1558 and became part of the Italian kingdom in 1860.

Modern Bari consists of the old city on the peninsula dividing the old from the new harbours; the new city along the coast on either side; and the industrial area inland. The chief features of historic interest are in the old city, notably the 12th-century Romanesque cathedral; the Norman castle, rebuilt by Frederick II and later extended; and the Basilica of San Nicola, founded in 1087 to house the relics of St. Nicholas, the patron saint of Bari. The seat of an archbishop and of a university (founded 1924), the city has a provincial picture gallery and archaeological museum. The annual Fiera del Levante, an Occidental-Oriental trade fair, has been held since 1930.

On the east coast railway from Milan and Bologna to Brindisi, Bari has international air services from nearby Palese airport and steamer services to Adriatic ports, the Black Sea, and the Mediterranean. Bari is connected by motorway to other Adriatic cities and to Naples on Italy's western coast. The city is an agricultural centre; its industries include food processing, petroleum refining, textile milling, printing, and the production of tobacco, sulfide, building materials, machinery, aluminum, and ironwork. A busy centre for sea trade with the Balkans and the Middle East, the Porto Nuovo exports wine, olive oil, and almonds. Pop. (1990 est.) mun., 355,352.

Bari, Siege of (1068–71), three-year blockade by Norman forces under Robert Guiscard that resulted (April 1071) in the surrender of the last important Byzantine stronghold in southern Italy. It brought an end to Byzantine domination on the Italian peninsula.

An Adriatic seaport and trading centre surpassed only by Venice, Bari commanded a strategic position on the crossroads between western Europe and the Byzantine East. Its well-fortified harbour had always protected it from attack by sea until Guiscard utilized the Norman fleet to blockade the harbour.

Barid Shāhi DYNASTY, the rulers of the small state of Bīdar (now in Karnāṭaka in southwestern India) from about 1487 until 1619. The Barid family were ministers of the Muslim Bahmanī sultans of the Deccan, who in 1430 made their capital at Bidar.

Barghest, drawing by Don Bolognese from *Dragons, Unicorns and Other Magical Beasts*, by Robin Palmer, 1966

© 1966 by Don Bolognese, reproduced by permission of Henry Z. Walck, Inc., publishers

About 1492 the Bahmanī kingdom disintegrated, but the sultans retained a small principality around Bidar. Real power was by then in the hands of Amīr Qāsim Barīd, and his grandson 'Alī Barīd assumed the royal title in 1542. The kingdom was absorbed by the larger Deccan kingdom of Bijāpur in 1619.

Barim Island: see Perim Island.

Barinas, estado ("state"), western Venezuela. It is bounded on the north by Trujillo, Portuguesa, and Cojedes states, east by Guarico, south by Apure, and west by Táchira and Mérida. It lies mainly in the Llanos (plains), although there are highlands in the northwest. The state is plagued by alternate drought and flood; wide stretches of savanna are inundated during the rainy season, from May to October. With the control of malaria, the rapid growth of the petroleum industry and of manufacturing, and the government's investment in the Llanos, especially in irrigation works in the northwest, the economy of Barinas has developed and diversified beyond its original base of cattle raising. Barinas has long ranked among Venezuela's most important states in cattle production, but agriculture is also important. The leading crops are beans, cotton, corn (maize), coffee, plantains, sesame, tobacco, and rice. The greatest changes have resulted from the discovery of oil in the state in 1948. A pipeline moves the oil some 200 miles (320 km) northward to refineries at Morón, near Puerto Cabello. The state's network of roads focuses on Barinas (*q.v.*), the state capital. Area 13,600 square miles (35,200 square km). Pop. (1995 est.) 516,789.

Barinas, city, capital of Barinas *estado* ("state"), western Venezuela. The city lies along the Santo Domingo River and is situated on the Llanos (plains) at the foot of the Cordillera de Mérida in the northwestern part of the state. The city's cathedral, museums, and other cultural and educational institutions are set among the colonial-era buildings of the centre. Barinas is the regional centre for a large cattle-raising area, and livestock products are its main commodities. Cacao and tobacco are cultivated in the hinterland. The city has an airport. Pop. (1990) 153,630.

Bārind, also called BĀRIND TRACT, geographic region in parts of northwestern Bangladesh and north-central West Bengal state, India. It lies northwest of the confluence of the Ganges (Padma) and Brahmaputra (Jamuna) rivers and is bordered by the floodplains of the Mahānanda River (west) and the Karatoya River (east). Bārind is a comparatively high, undulating region, with reddish and yellowish clay soils. It is cut by ravines and is divided into separate sections by the Atrai River and one of its tributaries. Rice is the predominant crop, but wheat, mustard, pulses, and palmyra (Tal) palms also are cultivated.

Baring FAMILY, British family whose banking and commercial house played a principal role in British overseas lending for two centuries.

John Baring emigrated from Bremen to England and started a small wool business near Exeter in 1717. His son, the future Sir Francis Baring, 1st Baronet (1740–1810), founded the family banking firm, originally named John & Francis Baring & Company, in London in 1763. He built it into a large and successful business, and from 1792 the house of Baring was instrumental in helping to finance the British war effort against Revolutionary and then Napoleonic France. In 1803 the house of Baring helped finance the Louisiana Purchase by the United States. In 1806 the firm was renamed Baring Brothers and Company. Francis Baring became a director of the East India Company and was a staunch supporter and

financial advisor of Prime Minister William Pitt the Younger, who made him a baronet in 1793.

By the time of Sir Francis' death in 1810, his company had become the leading banking house in Europe. Leadership of the firm passed to his second son, Alexander Baring, afterward 1st Baron Ashburton (1774–1848), who married Anne Bingham, a member of one of the wealthiest families in Pennsylvania, and who secured for Baring Brothers the leadership (until the American Civil War, 1861–65) in financing U.S. foreign trade and selling U.S. bonds. As ambassador to the United States, Lord Ashburton negotiated with U.S. Secretary of State Daniel Webster the Webster-Ashburton Treaty (1842) concerning the boundary between Maine and New Brunswick.

After Lord Ashburton's death in 1848 the affairs of the house were managed by Thomas Baring (1799–1873), a grandson of Sir Francis. Thomas Baring was a managing partner of the firm from 1828 and was also a member of Parliament from 1844 until his death. His elder brother, Sir Francis Thornhill Baring (1796–1866), was a member of Parliament from 1826 to 1865 and also served as chancellor of the Exchequer (1839–41) and first lord of the Admiralty (1849–52). In 1866 he was created Baron Northbrook, the barony being converted in 1876 into an earldom in favour of his eldest son, Thomas George Baring (1826–1904; see Northbrook, Thomas George Baring, 1st Earl of). The latter was occupied almost entirely with public affairs and is best remembered as viceroy of India, an office he held from 1872 to 1876.

With the death of Thomas Baring in 1873, Edward Charles Baring (1828–97), son of Henry Baring and grandson of Sir Francis Baring, became head of Baring Brothers, and in 1885 he was raised to the peerage as Baron Revelstoke. The house of Baring then stood at the height of its prosperity. During the following years the Baring bank oversaw the loan of large amounts of English capital to the government of Argentina. The continued default of the Argentine government involved Baring in such serious difficulties that it precipitated a general financial crisis in England in 1890. In a celebrated episode of financial history, Baring was rescued by the Bank of England, which, in conjunction with the leading joint-stock banks of the United Kingdom, took over Baring's liabilities amounting to £21,000,000. The firm of Baring Brothers was subsequently reorganized as a limited company, and, given this respite, the company and individual members of the family paid the entire debt.

Barings became an adviser to the British royal family on its investments, and during World War II the firm's managing director was entrusted with liquidating Great Britain's fixed assets in the United States. In the second half of the 20th century, Barings was overtaken in size and influence by other British merchant banking houses. In 1985 ownership of the bank was transferred to a charitable organization called the Baring Foundation, though control of the bank remained in the hands of Baring family members. Barings PLC, as the bank was called, declared bankruptcy in 1995 after an employee lost almost \$1,500,000,000 on unauthorized futures and options transactions. Barings was purchased by a Dutch banking and insurance company, Internationale Nederlanden Groep NV (or ING), thereby ending the independent existence of the oldest merchant banking house in the City of London.

Members of the Baring family remained prominent in banking, private industry, and government throughout the 20th century. Other members of the family have included Evelyn Baring, 1st earl of Cromer (1841–1917; see Cromer, Evelyn Baring, 1st earl of), who was the de facto ruler of Egypt as British agent and consul general (1883–1907); and Maurice Baring (1874–1945), man of letters.

BIBLIOGRAPHY. Studies include Ralph W. Hidy, *The House of Baring in American Trade and Finance* (1949, reissued 1970), covering 1763–1861; and Philip Ziegler, *The Sixth Great Power* (1988), covering 1762–1929.

Baringo, Lake, lake in west-central Kenya. It is situated 3,200 feet (975 m) above sea level in the Great Rift Valley, east of the Kamasia (Ilkamasya) Hills. The lake has an area of 50 square miles (129 square km), is 11 miles (18 km) long and 5 miles (8 km) wide, and has an average depth of 17 feet (5 m). A freshwater lake with no visible outlet, its waters seep into lavas at its northern end, where a rocky shore contrasts with the alluvial flat on its southern border. The Kamasya and Njamus (Njemps) peoples of the Baringo basin catch species of tilapia (a perchlike fish) in the lake, herd cattle, and raise crops. The first European to reach the lake was Joseph Thomson in 1883.

Baripāda, city, northeastern Orissa state, eastern India, lying along the Burhābalang River. Founded about 1800, the city is a trade centre for rice, sugarcane, and timber and has some industry, including pottery making, distilling, and weaving. The former ruler's palace now houses Mayūrbhanj Purna Chandra College, and there is an archaeological museum. A narrow-gauge rail line links the city with the South-Eastern Railway along the coast. Pop. (1991) city, 49,619; metropolitan area, 69,240.

Barisāl, town, south-central Bangladesh. It lies in the Ganges (Padma) River delta on an offshoot of the Ariāl Khān River. Incorporated as a municipality in 1876, it is a transshipment centre for rice, hides, and pulses. It is linked by steamer with Dhākā (73 miles [117 km] north) and with Chittagong to the southeast. There is a medical college affiliated with the University of Dhākā. Barisāl gives its name to a curious natural phenomenon known as Barisāl guns, thundering noises heard in the delta and apparently coming from the sea. The sounds have not been satisfactorily explained but may have a seismic origin. Pop. (1991 prelim.) 180,014.

barite, also called BARYTES, or HEAVY SPAR, the most common barium mineral, barium sulfate (BaSO₄). Barite occurs in hydrothermal ore veins (particularly those containing lead and silver), in sedimentary rocks such as limestone, in clay deposits formed by the weathering of limestone, in marine deposits, and in cavities in igneous rock. It commonly forms as large tubular crystals, as rosettelike aggregates of those crystals, or as divergent plates known as crested barite. It is abundant in Castile and Andalusia, Spain; in North Rhine-Westphalia, Ger.; and at various localities in the southern Appalachian and central states and in California in the United States. Commercially, ground barite is used in oil well and gas well drilling muds; in the preparation of barium compounds; as a body, or filler, for paper,

Sample of crested barite from Missouri

Joseph and Helen Guetterman collection, photograph, John H. Gerard

cloth, and phonograph records; as a white pigment (*see* lithopone); and as an inert body in coloured paints. It forms a solid solution series with celestite, in which strontium replaces barium. For detailed physical properties, *see* sulfate mineral (table).

baritone (from Greek *barytonos*, "deep-sounding"), in vocal music, the most common category of male voice, between the bass and the tenor and with some characteristics of both. Normally, the baritone parts are written for a range of A to f', but this may be extended in either direction, particularly in solo compositions or as a reflection of an accepted cultural tradition (*e.g.*, that of England, France, Italy, Germany, or Russia). In practice, the classification of voices is determined not only by range but also by the quality, or colour, of the voice and the purpose for which it is to be trained and used. A singer of oratorio, for example, might be comfortable as a tenor, whereas the harsher demands on a tenor in operatic roles might influence the singer to develop his baritone range instead. The term *baritonans* was first used in Western music toward the end of the 15th century, when composers, chiefly at the French court, explored the polyphonic sonorities made possible by the addition of lower-pitched voices. Later choral singing, which evolved into the popular four-part writing (soprano, alto, tenor, bass), usually omitted the baritone. German composers seem to have been the first to focus on the use of the baritone as a solo voice, and the prominent use of baritone characters in Wolfgang Amadeus Mozart's operas was regarded as a distinct innovation by his European contemporaries. The acceptance of the baritone for principal parts considerably widened the range of male character types and shifted more emphasis to the lower voices in hero and lover roles, which had heretofore been associated with the higher voices.

baritone, valved brass instrument pitched in Bb or C; it is a popular band instrument dating from the 19th century and was derived from the cornet and flügelhorn (valved bugle). It resembles the euphonium but has a narrower bore and three, rather than four or five, valves. Its range extends three octaves upward from the E below the bass staff; the notes in the treble clef are written a ninth above the actual sound. The name baritone sometimes causes confusion; in Germany and often in the United States, the instrument is called both the tenor horn and the euphonium. All three terms may also refer to a saxhorn of similar pitch.

barium (Ba), chemical element, one of the alkaline-earth metals of main Group IIa of the periodic table. The element is used in metallurgy, and its compounds in pyrotechnics, petroleum mining, and radiology.

Properties, occurrence, and uses. Barium, which is slightly harder than lead, has a silvery white lustre when freshly cut. In nature it is always found combined with other elements. The Swedish chemist Carl Wilhelm Scheele discovered (1774) a new base (baryta, or barium oxide) as a minor constituent in pyrolusite, and from this base he prepared some crystals of barium sulfate, which he sent to Johan Gottlieb Gahn, the discoverer of manganese. A month later Gahn found that the mineral barite is also composed of barium sulfate. Only after the electric battery became available could Sir Humphry Davy finally isolate (1808) the element itself by electrolysis.

Though barium minerals are dense, barium

itself is comparatively light. Barium constitutes about 0.04 percent of the Earth's crust, chiefly as the minerals barite and witherite. Commercial production of barium depends upon the electrolysis of fused barium chloride or the reduction by aluminum of a mixture of barium monoxide and peroxide in an electrically heated vacuum furnace.

The metal is used as a getter in electron tubes to perfect the vacuum by combining with final traces of gases, as a deoxidizer in copper refining, and as a constituent in certain alloys. The alloy with nickel readily emits electrons when heated and is used for this reason in electron tubes and in spark plug electrodes. The presence of barium (atomic number 56) after uranium (atomic number 92) had been bombarded by neutrons was the clue that led to the recognition of nuclear fission (1939).

Naturally occurring barium is a mixture of seven stable isotopes: barium-138 (71.66 percent), barium-137 (11.32 percent), barium-136 (7.81 percent), barium-135 (6.59 percent), barium-134 (2.42 percent), barium-130 (0.101 percent), and barium-132 (0.097 percent). About twice this many radioactive isotopes have been prepared with mass numbers ranging from 126 to 143. In its compounds barium has an oxidation state of +2. The Ba²⁺ ion may be precipitated from solution by the addition of carbonate (CO₃²⁻), sulfate (SO₄²⁻), chromate (CrO₄²⁻), or phosphate (PO₄³⁻) anions. All soluble barium compounds are toxic.

Most barium compounds are produced from the sulfate via reduction to the sulfide. Barium sulfate (BaSO₄), a white, heavy powder that occurs in nature as the mineral barite, is one of the most insoluble salts known. It is widely used as a filler (*e.g.*, in paper and rubber) and finds an important application as an opaque medium in the X-ray examination of the gastrointestinal tract. Lithopone, a mixture of barium sulfate and zinc sulfide, is a brilliant white pigment.

A number of uses of barium compounds depend on the ready formation of the highly insoluble sulfate. Thus the compound barium carbonate (BaCO₃), perhaps the most important barium compound, is employed in removing sulfate from salt brines before they are fed into electrolytic cells (for the production of chlorine and alkali). The carbonate also is used to make other barium chemicals, as a flux in ceramics, and in the manufacture of optical glass, fine glassware, and ceramic permanent magnets for loudspeakers. Although barium carbonate is not soluble in water, it dissolves in the hydrochloric acid of the stomach and thus is used in rat poisons.

Another barium compound, barium chloride (BaCl₂ · 2H₂O), consisting of colourless crystals that are soluble in water, is utilized in heat-treating baths, in laboratories as a chemical reagent to precipitate soluble sulfates, and on a commercial scale with sodium sulfate to form a white filler and pigment (*blanc fixe*) for leather, rubber, cloth, and photographic paper. The oxygen compound barium peroxide (BaO₂) is used for both oxygen production and as a source of hydrogen peroxide. Volatile barium compounds impart a yellowish green colour to a flame owing to the emission of light of mostly two characteristic wavelengths. Barium nitrate, formed with the nitrogen-oxygen group NO₃⁻, and chlorate, formed with the chlorine-oxygen group ClO₃⁻, are used for this effect in green signal flares and fireworks.

bark, in woody plants, tissues external to the vascular cambium (the growth layer of

the vascular cylinder); the term bark is also employed more popularly to refer to all tissues outside the wood. The inner soft bark, or bast, is produced by the vascular cambium; it consists of secondary phloem tissue whose innermost layer conveys food from the leaves to the rest of the plant. The outer bark, which is mostly dead tissue, is the product of the cork cambium (phellogen). Layered outer bark, containing cork and old, dead phloem, is known as rhytidome. The dead cork cells are lined with suberin, a fatty substance that makes them highly impermeable to gases and water. Gas exchange between the inner tissues of bark-covered roots and stems and their surroundings takes place through spongy areas (lenticels) in the cork.

Bark is usually thinner than the woody part of the stem or root. Both inner bark (secondary phloem) and wood (secondary xylem) are generated by the vascular cambium layer of cells: bark toward the outside where the oldest layers may slough off, and wood toward the inside where it accumulates as dead tissue.

bark, also spelled BARQUE, sailing ship of three or more masts, the rear (mizzenmast)

Eagle, U.S. Coast Guard Academy cadet training bark

By courtesy of the U.S. Coast Guard

being rigged for a fore-and-aft rather than a square sail. Until fore-and-aft rigs were applied to large ships to reduce crew sizes, the term was often used for any small sailing vessel. In poetic use, a bark can be any sailing ship or boat.

bark beetle, also called ENGRAVER BEETLE, any member of the insect family Scolytidae (Ipididae, with more than 2,000 species) of the order Coleoptera. They are cylindrical, usually under 6 mm (0.25 inch) long, brown or black in colour, and often very destructive. The male and female—sometimes as many as

Bark beetle (*Dendroctonus valens*)

William E. Ferguson

60 females are found with each male—bore into a tree and form an egg chamber. The female deposits her eggs in niches along the sides of the chamber. After the eggs hatch, the larvae bore away from the chamber, forming a characteristic series of tunnels. Each larva pupates at the end of its tunnel and emerges as an adult through a hole bored in the bark.

Different species of bark beetles attack particular trees, damaging roots, stems, seeds, or fruits. Diseases are transmitted by some beetles. For example, the elm bark beetles of the genera *Scolytus* and *Hylurgopinus* carry the spores of the fungal Dutch elm disease. When bark is removed from affected trees, the arrangement of the galleries can be seen on the wood surface. Each species of elm bark beetle produces a distinctive gallery pattern. Most species of *Ips* and *Dendroctonus* attack pines, and the larvae of the clover root borer *Hylastinus obscurus* damage clover roots.

Other insects sometimes included in this family are the ambrosia beetles, also called timber beetles, which bore into the wood of trees, thereby destroying much timber. The female constructs a long central gallery, off of which are the egg chambers. On a pile of excrement and wood chips in the main chamber, she cultivates a fungus for food. The galleries of the ambrosia beetle are recognized by their uniform size and dark stain, which is caused by the fungus growing on the wall.

bark cloth: see bark painting.

bark-gnawing beetle, any member of the insect family Trogossitidae (Ostomidae), containing about 500 species, most of which are tropical. Bark-gnawing beetles range from 5 to 20 mm (0.2 to 0.8 inch) and are dark-coloured. Species *Tenebrioides mauritanicus* is found in granaries; its larvae, commonly known as cadelles, feed on both the grain and other insects in the grain. *Tennochilus virescens*, an eastern species, is blue-green in colour and has a ferocious bite.

bark painting, also called TAPA, or BARK CLOTH, nonwoven fabric decorated with figurative and abstract designs usually applied by scratching or by painting. The basic cloth-like material, produced from the inner bark, or bast, of certain trees (see bast fibre), is made by stripping off the bast, soaking it, and beating it to make the fibres interlace and to reduce thickness. The most popular material is the inner bark of the paper mulberry tree, although breadfruit and fig trees are also used. Hand-painted bark cloth is limited today primarily to northern Australia, the island of New Guinea, and parts of Melanesia.

On the Australian mainland, style varies according to location: from the Kimberley region to Oenpelli in the west, a naturalistic rendering of human and animal forms prevails; in the east, a schematized style, relying heavily on the lozenge motif, dominates; between Oenpelli and Groote Eylandt in the Gulf of Carpentaria, the schematized and naturalistic styles coexist. In the Kimberley region, bark paintings frequently depict mythological beings known as Wondjinas; it is not known whether the bark *wandjina* images had a religious significance, as did those that appear on the walls of caves. In Arnhem Land, where the X-ray style—which shows the internal structures of animals—is concentrated, bark paintings are done in a style of schematic naturalism. Some bark paintings, usually those depicting the Ancestors, can be viewed only by initiates. Others, which contain mostly narrative subject matter, may be viewed by all.

In New Guinea, animal motifs are predominant in the Lake Sentani–Humboldt Bay area; but in the art of the Gulf of Papua, where animal images are conspicuously absent, abstract motifs, such as the spiral and circle, and highly stylized representations of the human figure prevail. Bark painting rarely appears in

(Top) Tapa wall drapery painted with animal clan emblems, from the Teluk Jos Sudarso (Humboldt Bay) area, Irian Jaya (West New Guinea), Indonesia, in the Rijksmuseum voor Volkenkunde "Justinus van Nassau," Breda, Neth.; (bottom) bark painting of a freshwater fish, from Groote Eylandt, Gulf of Carpentaria, northern Australia, in the Charles P. Mountford Collection, St. Peters, South Australia
Hoile Bildarchiv, Baden-Baden, Ger

the art of the Sepik River basin, and no examples have been found in the Asmat or Massim regions. In Melanesia the style and content of bark paintings varies from region to region. See also wandjina style.

Barker, George, in full GEORGE GRANVILLE BARKER (b. Feb. 26, 1913, Loughton, Essex, Eng.—d. Oct. 27, 1991, Iteringham, Norfolk), English poet largely concerned with the elemental forces of life. His first verses were published in the 1930s, and he became popular in the '40s, about the same time as the poet Dylan Thomas, who voiced similar themes and whose reputation overshadowed Barker's.

Barker left school at 14 and worked at a variety of jobs before his first publications, the novel *Alanna Autumnal* and *Thirty Preliminary Poems* (both 1933). He taught English literature in Japan, the United States, and England (1939–74). Two of his important long poems are *Calamiterror* (1937) and *The True Confession of George Barker* (1950; rev. ed. 1957). His poems include the moving "Sonnet to My Mother."

Barker, Ma, byname of ARIZONA DONNIE BARKER, née CLARK (b. 1872, near Springfield, Mo., U.S.—d. Jan. 16, 1935, near Oklawaha, Fla.), matriarch of an outlaw gang of brothers and allies engaged in kidnapping and in payroll, post-office, and bank robberies in the 1920s and '30s. The activities of the gang, which included her sons, the "Bloody Barkers"—Herman (1894–1927), Arthur, known as "Doc" (1899–1939), and Fred (1902–35)—ranged throughout the midwestern United States from Minnesota to Texas. All met violent deaths. Ma Barker and Fred were killed at a Florida resort in a gun battle with the FBI; Arthur was killed in an attempted escape from Alcatraz; Herman, cornered by Kansas police,

shot himself. A fourth brother, Lloyd (1896–1949), a loner, spent 25 years in Leavenworth prison (1922–47) and, after release, was killed by his wife. (The father of the Barker boys, George Barker, was never a gang member and was abandoned by Ma Barker in 1927.)

Barker, Lady Mary Anne, née STEWART, also called LADY BROOME (b. 1831, Spanish Town, Jam.—d. March 6, 1911, London, Eng.), writer best known for her book *Station Life in New Zealand* (1870), a lively account of life in colonial New Zealand.

Stewart was educated in England, and at age 21 she married George R. Barker, then a captain of the Royal Artillery. He was knighted for his military service in 1860 but died shortly thereafter. In June 1865 she married Frederick Napier Broome, an Englishman who had immigrated to New Zealand seven years earlier, and, leaving behind her two children by Barker, she embarked with Broome for New Zealand. After three "supremely happy" years there, the couple sold their sheep farm and returned to England. Barker's *Station Life*, which sold well and was translated into French and German, was followed by 10 other books written in London, including *A Christmas Cake in Four Quarters* (1872), about Christmas Day in North Canterbury (on South Island, N.Z.).

In 1875 she joined her husband, who had been appointed colonial secretary of Natal (S.Af.), later accompanying him to Mauritius, Western Australia, Barbados, and Trinidad and writing of these experiences. Broome was knighted in 1884, and Barker published the last of her 22 books, *Colonial Memories* (1904), as Lady Broome.

Barkerville, restored ghost town, east-central British Columbia, Canada, in the western foothills of the Cariboo Mountains, just west of Bowron Lake Provincial Park and 55 miles (88 km) east of Quesnel. Once a boomtown of nearly 10,000 inhabitants, which sprang up during the Cariboo gold rush, it was named after Billy Barker, a prospector who made an important strike locally at Williams Creek in 1862. It is now a provincial historical park (established 1959) and a tourist attraction. The 400-mile (650-kilometre) Cariboo Road from Yale at the head of navigation of the Fraser River to Barkerville was the major wagon route in the 1860s to the gold-mining region; it is now rebuilt and much extended.

barkhan (sand dune): see barchan.

Barkhausen, Heinrich Georg (b. Dec. 2, 1881, Bremen, Ger.—d. Feb. 20, 1956, Dresden, E.Ger. [Germany]), German physicist who discovered the Barkhausen effect, a principle concerning changes in the magnetic properties of metal.

Barkhausen attended the universities of Munich and Berlin before earning his doctorate in 1907 from Göttingen. After working for the Siemens & Halske laboratories in Berlin, he accepted the world's first professorship in the communications branch of electrical engineering, at the Technical Academy in Dresden (1911). There he worked on theories of spontaneous oscillation and nonlinear switching elements and formulated electron-tube coefficients that are still in use. He also experimented with acoustics, proposing methods for the subjective measurement of loudness.

His work in acoustics and magnetism led to the discovery in 1919 of the Barkhausen effect, which provided evidence that magnetization affects whole domains of a ferromagnetic material, rather than individual atoms alone.

In 1920 Barkhausen developed, with Karl Kurz, the Barkhausen-Kurz oscillator for ultrahigh frequencies (a forerunner of the microwave tube), which led to the understanding

of the principle of velocity modulation. He is also known for experiments on shortwave radio transmissions.

Barkhausen effect, series of sudden changes in the size and orientation of ferromagnetic domains, or microscopic clusters of aligned atomic magnets, that occurs during a continuous process of magnetization or demagnetization. The Barkhausen effect offered direct evidence for the existence of ferromagnetic domains, which previously had been postulated theoretically.

Heinrich Barkhausen, a German physicist, discovered in 1919 that a slow, smooth increase of a magnetic field applied to a piece of ferromagnetic material, such as iron, causes it to become magnetized, not continuously but in minute steps. The sudden, discontinuous jumps in magnetization may be detected by a coil of wire wound on the ferromagnetic material; the sudden transitions in the magnetic field of the material produce pulses of current in the coil that, when amplified, produce a series of clicks in a loudspeaker. These jumps are interpreted as discrete changes in the size or rotation of ferromagnetic domains.

Barking and Dagenham, outer borough of eastern London, part of the historic county of Essex, on the north bank of the River Thames. From the 7th to the mid-16th century AD, development was centred on Barking Abbey (founded c. 666). The ruins of the abbey adjoin the parish church of St. Margaret. Other notable sites include the church of St. Peter and St. Paul and the 15th-century Cross Keys Inn, where Shakespeare's dramatic troupe, the Chamberlain's Men, are thought to have performed before moving on to such venues as the Globe Theatre. Fishing and market gardening were once economically important. The immense Barking Power Station closed in 1981 but is still a conspicuous landmark. Ford Motor Company and Rhône-Poulenc SA now operate large manufacturing facilities. The ethnic makeup of the borough is fairly homogeneous, with minorities accounting for only a small percentage of the total population. Pop. (1998 est.) 155,600.

Barkla, Charles Glover (b. June 7, 1877, Widnes, Lancashire, Eng.—d. Oct. 23, 1944, Edinburgh), physicist awarded the Nobel Prize for Physics in 1917 for his work on X-ray scattering, which occurs when X-rays pass through a material and are deflected by the atomic electrons. This technique proved to be particularly useful in the study of atomic structures.

Educated at Trinity and King's colleges, Cambridge, he joined the faculty of Liverpool University in 1902, moved to the University of London in 1909, and became professor of natural philosophy at the University of Edinburgh in 1913. In 1906 Barkla and C.A. Sadler used X-ray scattering to determine the number of electrons in the carbon atom. At about the same time he was able to polarize X-rays (select X-ray waves that vibrate in the same plane), thus demonstrating that X-rays are transverse waves and hence like other electromagnetic radiations, such as light.

Barkley, Alben W(illiam) (b. Nov. 24, 1877, Graves County, Ky., U.S.—d. April 30, 1956, Lexington, Va.), 35th vice president of the United States (1949–53) under Pres. Harry S. Truman; one of the chief builders of the Democratic New Deal in the 1930s, he became a major symbol of party continuity as a member of Congress for almost 40 years.

Barkley began practicing law in 1898 at Paducah, Ky. An early participant in Democratic politics, he was elected in 1912 to the U.S.

Barkley
Paducah Sun-Democrat

House of Representatives, serving seven successive terms (1913–27). In 1926 he was elected to the U.S. Senate, in which he served until 1949. Increasing senatorial seniority enhanced his influence on the committees on foreign affairs and finance. He was a leading spokesman for the domestic and international policies of the administration of Pres. Franklin D. Roosevelt. An able parliamentary tactician, he served from 1937 to 1947 as Senate majority leader.

Barkley played important roles at every Democratic national convention he attended from 1932, and at the 1948 convention he was nominated for the vice presidency. He served steadfastly, if unspectacularly, for the next four years. He sought the presidential nomination in 1952 but withdrew when informed that many considered him too old for that office. He was reelected to the Senate in 1954, the same year his autobiography, *That Reminds Me*, was published.

Barkly, Sir Henry (b. 1815, Ross-shire, Scot.—d. Oct. 20, 1898, London), British colonial administrator who played a major role in the establishment of responsible governments in Victoria (Australia) and Cape Colony (South Africa).

The son of a merchant, Barkly was a member of Parliament for Leominster from 1845 to 1848 and then served appointments as governor of British Guiana (1848–53), Jamaica (1853–56), Victoria (1856–63), Mauritius (1863–70), and Cape Colony (1870–77). In 1870 he was named high commissioner to settle a dispute among the Transvaal, the Orange Free State, and the chief of the West Griqua tribe over border territory lately discovered to be rich in diamonds. He found for the Griquas but proclaimed Griqualand West a crown dependency in 1871. He was knighted in 1853.

Barkly Tableland, region of Australia, south of the Gulf of Carpentaria and extending southeastward about 350 miles (560 km) from Newcastle Creek, Northern Territory, to Camooweal, Queen. A grassy, undulating upland (average altitude 1,000 feet [300 m]), nourished by subartesian water and seasonal water courses, it embraces an area of about 50,000 square miles (130,000 square km). Cattle are bred on large open ranges. Visited in 1845 by Ludwig Leichhardt, it was named by William Landsborough in honour of Sir Henry Barkly, governor of Victoria (1856–63). It is crossed (east-west) by the Barkly Highway.

Barlach, Ernst (b. Jan. 2, 1870, Wedel, Ger.—d. Oct. 24, 1938, Güstrow, Ger.), outstanding sculptor of the Expressionist movement whose style has often been called modern Gothic. He was also a distinguished playwright whose most notable dramas, *Der tote Tag* (1912; "The Dead Day") and *Der Findling* (1922; "The Foundling"), combine symbolism and realism to present the tragic futility of existence. Similarly, his expression-

istic graphic work is notable for its preoccupation with the sufferings of humanity.

He studied art in Hamburg and later in Dresden and Paris. Influenced early in his career by Jugendstil, Germany's Art Nouveau style, he vacillated between sculpture and decorative arts. In 1906 he travelled to Russia. The strong bodies and expressive faces of the Russian peasants stimulated the development of his mature style, which characteristically features heavy, massive figures in rigid drapery, animated by a single, forceful movement. This is exemplified by "The Avenger" (1922; private collection).

Barlach's interest in late Gothic German sculpture led to his preference for wood sculpture. Even when he worked with other materials, as in his bronze "Death" (1925; Ernst Barlach Haus, Hamburg), he often emulated the blocky, rough-hewn quality of wood sculpture to achieve a more brutal effect.

Barlach achieved great fame in the 1920s and early 1930s, when he executed, among other works, the celebrated war memorials in Magdeburg and Hamburg and the religious figures for the church of St. Katherinen in Lübeck. Although his work was removed from

"The Avenger," wood sculpture by Ernst Barlach, 1922; in the collection of Mrs. Herman Shulman, New York City

the museums under the Nazi regime, after World War II his genius was once more recognized. A Barlach society was established in Hamburg and a small Barlach museum near Lüneburg.

Barlavento, Ilhas de (Cape Verde): *see* Windward Islands.

Barletta, city, Bari province, Puglia (Apulia) region, southeastern Italy, and port and resort on the Adriatic Sea, northwest of Bari. Originating as the ancient Barduli, it served as the port and bathing resort for Canusium (modern Canosa di Puglia; 14 miles [22 km] west-southwest) in Roman times. Captured by the Ostrogoths (5th century), the Byzantines (6th century), and the Lombards (6th century), it became part of the Kingdom of Naples in the 11th century. During a siege of Barletta by the French in 1503 a combat took place between 13 Italian and 13 French picked knights in which the Italians were victorious. An episcopal see, Barletta was the seat of the archbishops of Nazareth from 1291 to 1818.

Notable buildings of the old town include the Gothic cathedral (1150; extended 14th and 15th centuries); the Norman castle, extended by the emperor Charles V in 1532–37; and the 13th-century church of S. Sepolcro. There are several palaces and museums.

An agricultural centre, Barletta is noted for wines, olives, almonds, and fruits. The main industries are electrical, chemical, and automobile manufacture and sawmilling and leatherworking. The port is important for fishing as well as commerce. Pop. (1999 est.) mun., 91,904.

barley, cereal plant belonging to the genus *Hordeum* of the grass family Poaceae (Gramineae) and its edible grain. *Hordeum* comprises

Barley (*Hordeum vulgare*)

Grant Hellman

four sections, and all cultivated barleys belong to the section *Cerealina*. The three species within this section include *Hordeum vulgare*, a six-rowed type having its spike notched on opposite sides, with three spikelets at each notch, each containing a small individual flower, or floret, that develops a kernel; *Hordeum distichum*, a two-rowed type having central florets producing kernels and lateral florets that are normally sterile; and *Hordeum irregulare*, sometimes called Abyssinian intermediate, the least cultivated, with fertile central florets and varying proportions of fertile and sterile lateral florets.

Barley cultivation probably originated in the highlands of Ethiopia and in Southeast Asia in prehistorical times. It is believed to extend back to 5000 BC in Egypt, 3500 BC in Mesopotamia, 3000 BC in northwestern Europe, and 2000 BC in China. Barley was the chief bread plant of the Hebrews, Greeks, and Romans and of much of Europe through the 16th century.

Barley is adaptable to a greater range of climate than any other cereal, with varieties suited to temperate, sub-Arctic, or subtropical areas. Although it does best in growing seasons of at least 90 days, it is able to grow and ripen in a shorter time than any other cereal; cultivation is possible even in very short seasons such as those of the Himalayan slopes, although the yield there is smaller than in less harsh areas. Barley, with greater resistance to dry heat than other small grains, thrives in the near-desert areas of North Africa, where it is mainly sown in the autumn. Spring-sown crops are especially successful in the cooler, moist areas of western Europe and North America.

The annual world harvest of barley in the late 1970s was approximately 180,000,000 metric tons from about 246,000,000 acres (96,000,000 hectares). About half of the world's crop is used as livestock feed, the rest for human food and for malting. Most beer is made from malted barley, more than 10 percent of the world's crop being used for this purpose; malted barley is also used in the production of distilled beverages (see malt).

Barley has a nutlike flavour and is high in carbohydrates, with moderate quantities of protein, calcium, and phosphorus and small amounts of the B vitamins. Because it contains little gluten, an elastic protein substance, it cannot be used to make a flour that will produce a porous loaf of bread; barley flour is used to make an unleavened type, or flatbread, and to make porridge, especially in North Africa and parts of Asia, where it is a staple food grain. Pearl barley, the most popular form in many parts of the world, consists of whole kernels from which the outer husk and part of the bran layer have been removed by a polishing process. It is added to soups.

Barley has a soft straw, used mostly as bed-

ding for livestock and as a feed providing bulk roughage.

barley-sugar column (architecture): see salomónica.

Barlow, Joel (b. March 24, 1754, Redding, Connecticut Colony—d. Dec. 24, 1812, Zarnowiec, Pol.), public official, poet, and author of the mock-heroic poem *The Hasty Pudding*.

A graduate of Yale, he was a chaplain for three years in the Revolutionary Army. In July 1784 he established at Hartford, Conn., a weekly paper, the *American Mercury*. In 1786 he was admitted to the bar. Along with John Trumbull and Timothy Dwight, he was a member of the group of young writers, known as the Connecticut, or Hartford, Wits, whose patriotism led them to attempt to create a national literature. Barlow's *Vision of Columbus* (1787), a poetic paean to America in nine books, brought the author immediate fame.

In 1788 Barlow went to France as the agent of the Scioto Land Company and induced the company of Frenchmen who ultimately founded Gallipolis, Ohio, to emigrate to America. In Paris he became a liberal in religion and an advanced republican in politics. In England he published various radical essays, including *Advice to the Privileged Orders* (1792), proscribed by the British government. In 1792 he was made a French citizen. Thomas Paine had become his friend in England, and during Paine's imprisonment in Paris Barlow effected the publication of *The Age of Reason*.

In 1795–97 he was sent to Algiers to secure a release of U.S. prisoners and to negotiate treaties with Tripoli, Algiers, and Tunis. He

Joel Barlow, detail of an engraving by A. Smith after a painting by R. Fulton, 1807

returned to the United States in 1805 and lived near Washington, D.C., until 1811, when he became U.S. plenipotentiary to France. He became involved in Napoleon's retreat from Russia and died in Poland of exposure.

In addition to religious verse and political writings, Barlow published an enlarged edition of his *Vision of Columbus* entitled *The Columbiad* (1807), considered by some to be more mature than the original but also more pretentious. His literary reputation now rests primarily on *The Hasty Pudding* (1796), which has appeared in many anthologies. A pleasant and humorous mock epic inspired by homesickness for New England and cornmeal mush, it contains vivid descriptions of rural scenes.

Barlow, Peter (b. Oct. 13, 1776, Norwich, Norfolk, Eng.—d. March 1, 1862, Kent), optician and mathematician who invented two varieties of achromatic (non-colour-distorting) telescope lenses known as Barlow lenses.

Self-educated, he became assistant mathematics master at the Royal Military Academy, Woolwich, in 1801. He published numerous mathematical works, including *New Mathematical Tables* (1814). Later known as *Bar-*

low's Tables, this compilation of factors and functions of all numbers from 1 to 10,000 was considered so accurate and so useful that it has been regularly reprinted ever since.

In 1819 Barlow began work on the problem of deviation in ship compasses caused by the presence of iron in the hull. For his method of correcting the deviation by juxtaposing the compass with a suitably shaped piece of iron, he was awarded the Copley Medal of the Royal Society. He also conducted early investigations into the development and efficiency of the electric telegraph.

Barlow constructed (1827–32) his first achromatic telescope lens by enclosing liquid carbon disulfide between two pieces of glass. His second lens (1833) was a combination of flint and crown glass. The Barlow lens has come into general use for increasing the eyepiece power of any optical instrument.

Barmakids, also called BARMECIDES, Arabic AL-BARĀMIKA, or AL-BARMAK, priestly family of Iranian origin, from the city of Balkh in Khorāsān, who achieved prominence in the 8th century as scribes and viziers to the early 'Abbāsīd caliphs. Their ancestor was a *barmak*, a title borne by the high priest in the Buddhist temple of Nawbahār. The Barmakids were also known for their patronage of literature, philosophy, and science and for their tolerant attitude toward various religious and philosophical issues. They promoted public works—such as canals, mosques, and postal services—but also squandered money on building magnificent palaces by the Tigris.

When Balkh, the native town of the Barmakids, fell to the Arabs c. 663, Khālid ibn Barmak and his brothers moved to the garrison city of Basra in Iraq, where they converted to Islām.

Khālid ibn Barmak. Khālid ibn Barmak is the first Barmakid about whom much is known. He first appears in the mid-8th century as a supporter of the revolutionary movement that established the 'Abbāsīd caliphate. In 747 Khālid was put in charge of the distribution of spoils when the 'Abbāsīd army moved toward Iraq. Afterward, he was sent to Dayr Qunnā to administer the district. Under the 'Abbāsīd caliph Abū al-'Abbās as Saffāh, Khālid shared ministerial authority with Abū al-Jahm and was entrusted with the army and the collecting of the land tax.

Khālid's intimacy with the Caliph reached the extent that the latter entrusted him with the upbringing of his daughter. During the reign of al-Manṣūr, Khālid was appointed governor of Fars, and in 765 he was among the delegates to obtain Prince 'Isā's renunciation of succession to the caliphate. Khālid then was nominated governor of Ṭabaristān, where coins were struck in his name between 767 and 771. There, he distinguished himself by capturing Ustūnā Wand and building a town called Manṣūrah. Because of political intrigues and rivalry, al-Manṣūr dismissed Khālid in 775 and imposed a heavy fine upon him. Al-Khayzurān, Prince al-Mahdi's wife, helped him to raise the money. Subsequently Khālid was sent to Mosul to suppress Kurdish disturbances while his son Yaḥyā was put in charge of Azerbaijan. The Barmakids were endowed with more privileges during al-Mahdi's reign, when Khālid, helped by his son Yaḥyā, was appointed governor of Fars.

Yaḥyā. Khālid died in 781/782. Yaḥyā, well trained by his father and already undertaking various administrative jobs, was nominated in 778 as secretary-tutor to the Caliph's son Hārūn. As secretary, he played a decisive role in ensuring the succession of his ward to the caliphate. In 779/780 the Caliph appointed Hārūn, accompanied by Yaḥyā, to lead the expedition against the Byzantines. On his re-

turn Hārūn was put in charge of the western provinces, with Yahyā as his adviser. In 781 Hārūn was proclaimed second in succession after his brother Mūsā, but a little later—and due to al-Khayzurān's and Yahyā's influence—the Caliph intended to deprive Mūsā of his rights as an heir apparent but died before accomplishing his scheme. Hārūn decided not to put up any opposition to the new caliph Mūsā al-Hādī. This wise decision, inspired by Yahyā, perhaps saved the empire from civil war.

Al-Hādī, in turn, confirmed Yahyā's position with Hārūn. This was, no doubt, a tactical error by al-Hādī, for when he decided to nominate his own son to the caliphate, Hārūn would have given in had Yahyā not objected. Yahyā tried in vain to convince the Caliph that the violation of an oath after so short a time would have disastrous consequences. Hārūn and Yahyā were jailed. At this point, however, al-Hādī suddenly died in obscure circumstances.

Thus Hārūn ar-Rashīd (786–809) was raised to power not by his own efforts but by the machinations of the queen mother al-Khayzurān and Yahyā the Barmakid. It was, therefore, no surprise that he put the whole administration in the hands of Yahyā and his sons. Yahyā received the title of *wazīr*, and his sons al-Faḍl and Ja'far were placed in charge of the Caliph's personal seal.

Al-Faḍl and Ja'far. Al-Faḍl and Ja'far also bore the title *wazīr*. Ja'far, the younger brother and ar-Rashīd's favourite, was known for his eloquence and for his love of pleasure and parties. He rarely left the court, but when, in 796, the Caliph sent him to control a disturbance in Syria, Ja'far succeeded in quieting the situation. On his return, he was appointed director of the bureaus (*dīwāns*) of the post, textiles, and mint. In the latter office Ja'far minted coins in his name in various provinces. Al-Faḍl, unlike his brother, distinguished himself by his competence and seriousness. When in 792 the 'Alid Yahyā ibn 'Abd Allāh rebelled in Daylam, al-Faḍl, through diplomacy and promises, persuaded him to give in. In 793 al-Faḍl was appointed governor of Khorāsān; he was able to put an end to the disturbances in Kābul. In 797 al-Faḍl took over the central government from his father, who resided at Mecca. Al-Faḍl, besides, was a tutor to ar-Rashīd's elder son and heir apparent, al-Amīn.

The fall of the Barmakids. The Barmakids' influence lasted 17 years, but they were extirpated at the peak of their power and fortune. Ja'far, only 36 years old, was executed in 803 and parts of his body displayed on the bridges of Baghdad. Other Barmakids, with the exception of Muḥammad ibn Khālid, were imprisoned and their property confiscated. Yahyā and al-Faḍl died in prison in 805 and 808, respectively. A number of their partisans were accused of heresy and executed.

The Barmakids' fall was sudden and brutal. Many accusations were made against them at the time, but the Barmakids' disgrace is to be attributed, first, to their overmighty influence in the court, administration, and society. Second, they seized every opportunity to enrich themselves (which accounts for their ostentatious generosity). Thirdly, they showed a certain degree of liberalism toward various religious and political sects, which the Caliph considered as a danger to his authority. The Barmakids' role ended but their fame survived. They became the subject of controversies among historians. Contradictory traditions, marred by the obvious flattery or prejudice by which they are inspired, represent an attempt by narrators to exalt or discredit the Barmakids' character, thus obscuring their true historical role. Late Muslim

literature, especially Persian literature, is inclined to visualize the Barmakid period as an ideal period in the history of the caliphate. These traditions even consider the Barmakids Zoroastrian by faith and trace their descent to the Sāsānid period. Be that as it may, their downfall was to be considered the end of the theory that ministers were initiators of policy and not merely heads of administration; it also marked the Caliph's reaction against the liberal tendency current at the time.

The expression Barmecide feast, for an imaginary banquet, comes from "The Barber's Tale of His Sixth Brother" (*The Arabian Nights' Entertainment*), where a Barmakid has a series of empty dishes served to a hungry man to test his sense of humour. (F.Om.)

Barmen, Synod of, meeting of German Protestant leaders at Barmen in the Ruhr, in May 1934, to organize Protestant resistance to National Socialism (Nazism). The synod was of decisive importance in the development of the German Confessing Church (Bekennende Kirche). Representatives came from established Lutheran, Reformed, and United churches, although some of the church governments had already been captured by men loyal to Adolf Hitler, and others had decided to limit their activities to passive resistance. The Pastors' Emergency League, headed by Martin Niemöller, was the backbone of the active resistance. Various lay leaders and groups also rallied to the cause.

At Barmen the representatives adopted six articles, called the Theological Declaration of Barmen, or the Barmen Declaration, that defined the Christian opposition to National Socialist ideology and practice. The major theological influence was that of Karl Barth. The declaration was cast in the classical form of the great confessions of faith, affirming major biblical teachings and condemning the important heresies of those who were attempting to accommodate Christianity to National Socialism. It is treated as a confession by some denominations.

Bärmer, town, administrative headquarters of Bärmer district, Rājasthān state, northwestern India. Standing on a rocky hill crowned by a fort, the town is said to have been founded in the 13th century, when it was named Bahadamer (The Hill Fort of Bahada), after a local raja. The name has since been contracted to Bärmer. Connected by rail with Jodhpur, it is a trade mart for camels, sheep, wool, and salt. Handicraft products include millstones, camel fittings, and leather bags. The town has an observatory, a hospital, and a government college affiliated with the University of Rājasthān.

Bärmer district (10,960 sq mi [28,387 sq km] in area) chiefly comprises what was formerly the Mallani district of the princely state of Jodhpur—an expanse of sandy plain forming part of the Great Indian (Thar) Desert, watered only by the Lūni River in the south. Irriga-

tion is mainly by means of deep wells, bajra (pearl millet) being the chief crop. The breeding of cattle, horses, camels, sheep, and goats is important to the economy; fuller's earth, bentonite, and gypsum deposits are worked. Pop. (1991) town, 68,600; district, 1,435,222.

barn, in agriculture, farm building for sheltering animals, their feed and other supplies, farm machinery, and farm products. Barns are named according to their purpose, as hog barns, dairy barns, tobacco barns, and tractor barns. The principal type in the United States is the general-purpose barn, used for housing horses and mules, cows, calves, and sheep and for storing hay and grain. Although the need for the general barn declined with the advent of tractors and electrical service, one or more barns are still found on the majority of North American and European farms. Many have been adapted to other uses.

Wood is the traditional barn material, but sheet steel and aluminum have been increasingly used since World War II, particularly on large farms. Barns usually consist of two stories, the first to shelter animals or machines and the second to store hay or grain, though one-story barns were gaining in popularity in the late 20th century.

barn, unit of area used to measure the absorption cross section of atomic nuclei in the study of interactions between the nuclei and other particles. It is equal to 10^{-24} square centimetre. The name, coined by U.S. scientists, is derived from the proverbial phrase "side of a barn," something easy to hit. See cross section.

barn owl, any of several species of nocturnal birds of prey of the genus *Tyto* (family Tytonidae). Barn owls are sometimes called monkey-faced owls because of their heart-shaped facial disks and absence of ear tufts. They are about 30 to 40 centimetres (12 to 16 in.) long, white to gray or yellowish to brownish orange. Their eyes are small in comparison with those of other owls and dark-coloured. Barn owls hunt mainly small rodents (such as mice and

Common barn owl (*Tyto alba*)

Karl Maslowski—Photo Researchers

shrews), often in cultivated land. They nest in hollow trees, buildings, towers, and old hawk nests.

The common barn owl (*Tyto alba*) occurs worldwide except in Antarctica and Micronesia. Other species occur only in the Old World. Many inhabit open grasslands. Some are called grass owls (such as the common grass owl, *Tyto capensis*, of India, the South Pacific, Australia, and South Africa).

Barnabas, SAINT, original name JOSEPH THE LEVITE, or Joses the Levite (b. Cyprus; fl. 1st century; feast day June 11), Apostolic Father, an important early Christian missionary. Barnabas was a hellenized Jew who joined the Jerusalem church soon after Christ's crucifixion, sold his property, and gave the proceeds to the community (Acts 4:36–37). He was one of the Cypriots who founded (Acts

11:19–20) the church in Antioch, where he preached. After he called Paul from Tarsus as his assistant (Acts 11:25), they undertook joint missionary activity (Acts 13–14) and then went to Jerusalem in 48. Shortly afterward, a serious conflict separated them, and Barnabas sailed to Cyprus (Acts 15:39). There is no contemporary mention of his subsequent activity, except for a brief reference by Paul a few years later (I Corinthians 9:6).

Nothing is known for certain about the time or circumstances of his death. Barnabas' alleged martyrdom and burial in Cyprus are described in the apocryphal *Journeys and Martyrdom of Barnabas*, a 5th-century forgery. Subsequent church tradition finds Barnabas in Alexandria, Egypt, and ascribes to him the *Letter of Barnabas* (an exegetical treatise on the use of the Old Testament) or pictures him in Rome and assumes that he wrote the *Letters to the Hebrews*. Barnabas' reputed tomb, discovered in 488, is near the Monastery of St. Barnabas, in the Cypriot city of Salamis, whose Christian community was founded by Paul and Barnabas.

Barnabas, Letter of, an early Christian work written in Greek by one of the so-called Apostolic Fathers, Greek Christian writers of the late 1st and early 2nd centuries. Ascribed by tradition to St. Barnabas, the Apostle, the writing dates possibly from as late as AD 130 and was the work of an unknown author who refers to himself in the letter as a teacher.

The *Letter of Barnabas* was essentially a treatise on the use of the Old Testament by Christians. Very anti-Jewish, the author believed that the Old Testament could not be understood by Jews and that its significance could be understood only by those who read it and searched for types, or prefigurations, of Jesus. At the end of the letter the author discusses the ways of light and darkness—i.e., the ways of good and of evil.

Evidently regarded as scriptural in Egypt, the *Letter of Barnabas* was included in the Codex Sinaiticus, a 4th-century Greek manuscript of the Bible, and it was also quoted by the presbyter Clement of Alexandria (d. c. 215). It was less highly regarded elsewhere, however, and few Christians continued to read it.

Barnack, Oskar (b. Nov. 1, 1879, Lynow, Brandenburg [Germany]—d. Jan. 16, 1936, Bad Nauheim, Ger.), designer of the first precision miniature camera to become available commercially, the Leica I, which was introduced in 1924 by the Ernst Leitz optical firm at Wetzlar, Ger.

Barnack was a master mechanic and inventor who joined the Leitz optical firm in 1911. Barnack had completed a prototype of the Leica by 1913, but World War I and the postwar chaos in Germany delayed production. The success of the Leica I promoted the use of 35-millimetre and other small cameras. Barnack determined the standard 24 × 36-millimetre picture size for 35-millimetre film and was partly responsible for the Leitz Elmar lens.

barnacle, also called CIRRIPEDE, any of a majority of the 1,000 species of marine crustaceans of the subclass Cirripedia. Adults of cirripedes other than barnacles are internal parasites of crabs, jellyfish, starfish, and some other marine invertebrates. They have no popular name.

A brief treatment of cirripedes follows. For full treatment, see MACROPAEDIA: CRUSTACEANS.

As adults, typical barnacles are covered with calcareous plates and are cemented, head down, to rocks, pilings, ships' hulls, driftwood, or seaweed, or to the bodies of larger sea creatures, from clams to whales. They trap tiny particles of food by means of cirri—feathery retractile organs formed by metamorphosis of certain of their legs.

Adult cirripedes commonly are hermaphro-

Barnacle

Anthony Mercieca, from Root Resources—EB Inc.

dites (having male and female reproductive organs in the same individual). Hermaphroditic forms sometimes have a minute, virtually formless complementary male attached to them; in the few species with separate sexes, a similar male is attached to a much larger, fully formed female. Cross-fertilization is usual, but self-fertilization does occur. The eggs mature within the mantle cavity, and the larvae emerge as free-swimming forms called nauplii, as in other crustacean subclasses. In typical barnacles about six naupliar stages precede formation of the cypris—the subadult, which has a bivalved shell of chitin (a hard protein substance), cement glands on the antennules (first antennae), and cirri. The cypris changes into an adult by body rotation and starts to produce shell plates.

Typical barnacles (order Thoracica) have six pairs of cirri and more or less complete shells. Pedunculate (stalked) forms include the common goose barnacle (genus *Lepas*), found worldwide on driftwood. Acorn barnacles, also called rock barnacles, are sessile (not stalked); their symmetrical shells tend to be barrel-like or broadly conical. This group includes *Balanus*, responsible for much of the fouling of ships and harbour structures. Wart barnacles, such as *Verruca*, have asymmetrical shells.

Burrowing barnacles (order Acrothoracica) are small, unisexual forms that lack shells and have fewer than six pairs of cirri. They burrow into hard limy material, such as clam shells and coral. *Trypetesa* is found only inside the snail shells worn by hermit crabs.

Parasitic cirripedes of the order Rhizocephala, such as *Sacculina*, lack appendages, shell, and gut and resemble fungi. They parasitize decapod crustaceans (crabs and allies) by sending rootlike absorptive processes through the host's body; this intrusion inhibits the host's reproductive development (parasitic castration). Parasites of the order Ascothoracica, the most primitive of cirripedes, are cyprislike as adults. An example is *Laura*, found imbedded in cnidarians and echinoderms.

barnacle goose (*Branta leucopsis*), water bird of the family Anatidae (order Anseriformes) that resembles a small Canada goose, with dark back, white face, and black neck and bib. It winters in the northern British Isles and on the coasts of Denmark, Germany, and The Netherlands. During the European Middle Ages, people thought it hatched from barnacles; thus, the birds were considered "fish" and

could be eaten on Fridays. The Brent goose, or brant (q.v.), was called barnacle, or bernicle, in Ireland for the same reason.

Barnard, Chester Irving (b. Nov. 7, 1886, Malden, Mass., U.S.—d. June 7, 1961, New York City), American business executive, public administrator, and sociological theorist who specialized in the nature of corporate organization. Although he was not himself an academician, his first book, *Functions of the Executive* (1938), was widely influential in the teaching of sociology and business theory.

An employee of the American Telephone and Telegraph Company from 1909, Barnard became president of an AT&T subsidiary, the New Jersey Bell Telephone Company, in 1927. During the Great Depression, he directed the New Jersey state relief system. He later worked with the United Service Organizations (USO), of which he was president from 1942 to 1945. When he retired from business, he served as president of the Rockefeller Foundation (1948–52) and chairman of the National Science Foundation (1952–54).

In his theoretical writing, Barnard stressed the cooperative nature of a business organization. In many of his papers—some of which were published in *Organization and Management* (1948)—he elaborated his observation that executives' ability to deal with practical matters tends to diminish when the same problems are presented in theoretical terms.

Barnard, Christiaan (Neethling) (b. Nov. 8, 1922, Beaufort West, S.Af.—d. Sept. 2, 2001, Paphos, Cyprus), South African surgeon who performed the first human heart transplant operation.

As a resident surgeon at Groote Schuur Hospital, Cape Town (1953–56), he was the first to show that intestinal atresia, a congenital gap in the small intestine, is caused by an insufficient blood supply to the fetus during preg-

Christiaan Barnard, 1968

AP/Wide World Photos

nancy. This discovery led to the development of a surgical procedure to correct the formerly fatal defect. After completing doctoral studies at the University of Minnesota (1956–58), he returned to the hospital as senior cardiothoracic surgeon, introduced open-heart surgery to South Africa, developed a new design for artificial heart valves, and began extensive experimentation on heart transplantation in dogs.

On Dec. 3, 1967, Barnard led a team of 20 surgeons in replacing the heart of Louis Washkansky, an incurably ill South African grocer, with a heart taken from a fatally injured accident victim. Although the transplant itself was successful, Washkansky died 18 days later from double pneumonia, contracted after destruction of his body's immunity mechanism by drugs administered to suppress rejection of the new heart as a foreign protein.

Barnard's later transplant operations were increasingly successful; by the late 1970s a number of his patients had survived for several years. Barnard served as the head of the cardiac unit at Groote Schuur Hospital until 1983, at which time he retired from active sur-

gical practice. He wrote several novels and two autobiographies, *Christiaan Barnard: One Life* (1969) and *The Second Life* (1993).

Barnard, Edward Emerson (b. Dec. 16, 1857, Nashville, Tenn., U.S.—d. Feb. 6, 1923, Williams Bay, Wis.), astronomer who pioneered in celestial photography and who was the leading observational astronomer of his time.

Edward Barnard

By courtesy of the Niels Bohr Library, American Institute of Physics, New York

In 1889 he began to photograph the Milky Way with large-aperture lenses, revealing much new detail. He discovered 16 comets and Jupiter's fifth satellite (1892). In 1916 he discovered the star (Barnard's star) that has the greatest known proper motion (motion of an individual star relative to the other stars). He published a catalog of dark nebulae in 1919.

From 1883 to 1887 he studied at Vanderbilt University, Nashville, and was in charge of the observatory there. In 1887 he was appointed astronomer at Lick Observatory, Mt. Hamilton, California. From 1895 until his death he was professor of practical astronomy at the University of Chicago and astronomer at Yerkes Observatory in Williams Bay, Wis. His eyesight was renowned. He observed Mars in a position that was not directly opposite the Sun, when detail is revealed through shadowing, and also observed Martian craters in the 1890s. He made neither of those observations public at the time.

Barnard, Frederick (Augustus Porter) (b. May 5, 1809, Sheffield, Mass., U.S.—d. April 27, 1889, New York City), educator and for nearly 25 years president of Columbia College in New York City, during which time Columbia was transformed from a small undergraduate institution for men into a major university.

Graduated from Yale in 1828, Barnard was

Frederick Barnard, detail of an oil painting by an unknown artist, c. 1861; in the collection of the University of Mississippi, University, Miss.

By courtesy of the University of Mississippi, University, Miss.

president and chancellor of the University of Mississippi from 1856 to 1861, when he resigned because of his Union sympathies.

Until Barnard went to Columbia in 1864, he had always defended the traditional prescribed curriculum of the classics and mathematics. At Columbia, Barnard changed his views, urging the college to expand its curriculum and introduce the elective system into the last two undergraduate years, to best develop advanced scholarship leading to graduate and professional education. He was instrumental in establishing the School of Mines and opening the university to women. Barnard College, which bears his name, was founded as a "women's annex" in 1899 after the trustees had turned down his plan for coeducation at Columbia.

Barnard, George Grey (b. May 24, 1863, Bellefonte, Pa., U.S.—d. April 24, 1938, New York City), sculptor whose works were characterized by a vitality and individuality that brought him early fame.

After studying in Chicago and Paris, he exhibited at the 1894 Paris Salon, where his work (including the "Struggle of the Two Natures in Man," 1894; Metropolitan Museum of Art, New York City) created a sensation. Probably his best known work is a vigorous statue of Lincoln (Lytle Park, Cincinnati,

"Struggle of the Two Natures in Man," over-life-size marble sculpture by George Grey Barnard, 1894; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York, gift of Alfred Corning Clark, 1896

Ohio), which was the centre of a storm of criticism when it was unveiled in 1917. Barnard made a collection of early Gothic sculpture and medieval architectural fragments that in 1925 was purchased by the Metropolitan Museum of Art in New York City.

Barnard, Henry (b. Jan. 24, 1811, Hartford, Conn., U.S.—d. July 5, 1900, Hartford), educator, jurist, and the first U.S. commissioner of education (1867). With Horace Mann he shared early leadership in improving the U.S. educational system.

Born into a wealthy family, Barnard graduated from Yale in 1830 and then studied law. As a Whig member of the Connecticut state legislature (1837-39), he was instrumental in legislation that created a state board of education. Serving as secretary of that board, he founded the *Connecticut Common School Journal and Annals of Education* (1838) and the first teachers' institute (1839).

In 1843 Barnard was called to Rhode Island to make a study of that state's schools, and in 1845 he became the state's first commissioner of education. At his urging, appropriations were increased, teachers' wages were raised, buildings were repaired, and teaching and supervision were much improved. In 1851 he returned to his post in Connecticut as secretary

Henry Barnard, detail of a portrait by an unknown artist; in the University of Wisconsin collection, Madison

By courtesy of the University of Wisconsin, Madison

of the school board. He instituted reforms similar to those in Rhode Island, but eventually the job proved too strenuous for him, and in 1855 he retired. In that same year he helped found the American Association for the Advancement of Education and the *American Journal of Education*. He edited 30 volumes of the *Journal*, spending so much of his fortune that he died a virtual pauper.

Barnard travelled widely to confer with writers and educators abroad, among them William Wordsworth, Thomas De Quincey, and Thomas Carlyle. He was chancellor of the University of Wisconsin, Madison (1858-61), and president of St. John's College, Annapolis, Md. (1866-67).

The scope of his activities and publications is shown in the *Bibliography of Henry Barnard* (1897) by W.S. Monroe and in *Henry Barnard, School Administrator* (1938) by A.L. Blair.

Consult the INDEX first

Barnard, Kate (b. May 23, 1875, Geneva, Neb., U.S.—d. Feb. 23, 1930, Oklahoma City, Okla.), Oklahoma welfare leader and the first woman to hold statewide elective office in the United States.

Barnard began her public career as an officer of the Provident Association, an Oklahoma benevolent organization. She soon became interested in such social legislation as compulsory education and the abolition of child labour. Those concerns led her to actively lobby for progressive issues at the Oklahoma constitutional convention in 1906. She was elected in 1907 to the state office of commissioner of charities and corrections, leading the state Democratic ticket while becoming the first woman in the world to hold such a post.

While state commissioner from 1907 to 1914, Barnard won national attention for her promotion of reform legislation on such issues as child labour, prison reform, Indian rights, and the improved care of the insane.

Barnard, Lady Anne, née LINDSAY (b. Dec. 8, 1750, Balcarres House, Fifeshire, Scot.—d. May 6, 1825, London), author of the popular ballad "Auld Robin Gray" (1771).

In 1763 she married Sir Andrew Barnard and accompanied him to the Cape of Good Hope when he became colonial secretary there in 1797. When the Cape was ceded to Holland (1802), they settled permanently in London. "Auld Robin Gray," written to the music of an old song, was first published anonymously; in 1823 she confided its authorship to her friend Sir Walter Scott, who in 1825 prepared an edition of the ballad.

Barnard Castle, parish (town), Teesdale district, county of Durham, England, on the north bank of the River Tees (there crossed by a medieval bridge). It developed around

a Norman castle built by Bernard de Balliol, who gave the town its first charter in about 1178. The castle was the birthplace of John de Balliol, founder of Balliol College, Oxford, and father of John de Balliol, king of Scotland (1292–96). The town retains many Georgian buildings, including the town hall. The Bowes Museum, a former residence completed in 1892 in the style of a French château, has a notable art collection. In 1838 Charles Dickens was inspired to write *Nicholas Nickleby* (1839) while staying at the local King's Head Inn. Manufacture of stockings and carpets, the

Ruins of Barnard Castle, Durham, above the River Tees where crossed by a medieval bridge

A F Kersting

principal local activity in the early 19th century, has been superseded by other industries, including pharmaceuticals. Pop. (1991) 6,084.

Barnardo, Thomas John (b. July 4, 1845, Dublin, Ire.—d. Sept. 19, 1905, Surbiton, Surrey, Eng.), pioneer in social work who founded more than 90 homes for destitute children. Under his direction, the children were given care and instruction of high quality despite the then unusual policy of unlimited admittance.

Barnardo

BBC Hulton Picture Library

Barnardo's father, of an exiled Spanish Protestant family, emigrated from Hamburg, Ger., to Ireland. Barnardo himself went to London in 1866 to train as a Protestant medical missionary to China. While studying medicine he became superintendent of a "ragged school" (free school for poor children) in the East End of London, where, in 1867, he founded a juvenile mission. The first of "Dr. Barnardo's homes" for destitute boys was founded in 1870 and his first home for girls in 1876. The homes were chartered in 1899 as the National Incorporated Association for the Reclamation of Destitute Waif Children.

Barnard's star, second nearest star to the Sun, at a distance of about 6 light-years. It is named for Edward Emerson Barnard, the American astronomer who discovered it in 1916. Barnard's star has the largest proper motion of any known star—10".25 arc annually. It is a red dwarf star with a visual magnitude of 9.5; its intrinsic luminosity is only 1/2,300 that of the Sun.

Because of its high velocity of approach, 108 km (67 miles) per second, Barnard's star is gradually coming nearer the solar system and by the year 11,800 will reach its closest point in distance—namely, 3.85 light-years. The star is of special interest to astronomers because its proper motion, observed photographically between the years 1938–81, has shown periodic deviations of 1 micrometre, or 0".02 of arc. This "perturbation" is interpreted as being caused by the gravitational pull of two planetary companions having orbital periods of 13.5 and 19 years, respectively, and masses of about two-thirds that of Jupiter. The existence of planetary bodies outside the solar system, however, remains unproved.

Barnato, Barney, original name BARNETT ISAACS (b. 1852, London, Eng.—d. June 14, 1897, at sea), financier and diamond magnate who rivaled Cecil Rhodes in struggling for control in the development of the South African mining industry.

The son of a Jewish shopkeeper, Isaac Isaacs, in the East End of London, Isaacs followed his brother Henry to Kimberley, Cape of Good Hope, in 1873 to seek his fortune in the diamond rush. Adopting the name Barnato Brothers, which he and his brother had used in London as vaudeville entertainers, the two formed a diamond brokerage firm in 1874. Two years later "Barney" Barnato began the bold speculation in mining claims that led to the formation of the Barnato Diamond Mining Company (1880), which seriously challenged Cecil Rhodes's De Beers Mining Company. The struggle for control of the industry resulted in Rhodes's victory and the merger of the two companies as De Beers Consolidated Mines (1888), in which Barnato was made life governor. The same year he was elected to a seat in the Cape Parliament, which he held until his death. In 1889 he resumed speculating, buying up mining claims and real estate in the newly discovered Witwatersrand goldfields and floating Barnato Consolidated Mines and Barnato Bank. In ill health, however, Barnato committed suicide by jumping from a ship bound for England.

Barnaul, city and administrative centre, Altay *krai* (region), south-central Russia, on the left bank of the Ob River at its confluence with the Barnaulka. In 1738 a silver-refining works was established, the settlement becoming the hub of the Altay mining region. It was a major trade centre in the second half of the 19th century. Barnaul has good communications by the navigable Ob, by the South Siberian, Turk-Sib, and Omsk–Barnaul railways, and by roads to the Kolyvan–Rubtsovsk mining area and Novosibirsk. As a consequence, its industrial importance has increased and its range of products grown wider. Today its engineering industries produce boilers, presses, diesel motors, and radios; other industries make cotton textiles, chemical fibres, cellophane, tires, and lumber and forest products. There is also a range of consumer-goods industries. Barnaul has a research institute of agriculture and livestock husbandry and institutes for agriculture, engineering, teacher training, and medicine. Pop. (1997 est.) 591,000.

Barnave, Antoine (-Pierre-Joseph-Marie) (b. Oct. 22, 1761, Grenoble, Fr.—d. Nov. 29, 1793, Paris), prominent political figure of the early French Revolutionary period whose oratorical skill and political incisiveness made him one of the most highly respected members of the National Assembly.

Of an upper bourgeois Protestant family, Barnave was privately trained in law. In 1789 he was elected Dauphiné's deputy to the last States General and quickly established a reputation as the Count de Mirabeau's chief rival in debates in the new National Assembly. Throughout 1790 he played an active role in formulating the Assembly's decrees, addresses,

and resolutions, eventually becoming president of the National Assembly. At the same time, he joined his friends Adrien Duport and Alexandre de Lameth in the reorganization of the Club of the Jacobins.

In March 1790 he was elected to the Committee on Colonies and drafted several proposals supporting the interests of French trading monopolies in the West Indies, maintaining that their retention was vital to the needs of the French nation. His opponents, led by Jacques-Pierre Brissot, bitterly attacked his policies, and, as the antislavery campaign won favour in the increasingly radical Jacobin society, Barnave's influence waned considerably. The death of Mirabeau and the uprising of the Parisian populace in the spring of 1791 convinced him of the urgency of mobilizing the wealthy propertied class in support of a

Barnave, detail of a portrait by J.-B. Audebert; in the Bibliothèque Nationale, Paris

By courtesy of the Bibliothèque Nationale, Paris

strong constitutional monarchy. Louis XVI's abortive attempt to flee France in June 1791 led Barnave to believe that the king could be persuaded to accept the constitution as it stood and thus bring the Revolution to a close before its prolongation resulted in political anarchy. Thus he began his correspondence with Queen Marie-Antoinette, which became the source of later attacks against him.

On July 15, 1791, Barnave delivered his famous speech favouring the ultimate restoration of the king under a conservative monarchical constitutionalism, opposing republicanism as inappropriate to France's interests, and appealing for the end of the Revolution and its upheavals. When the National Assembly ended in September 1791, he retired to his home in Dauphiné, enrolled as an officer in the national guard, and began a project of correspondence and writing. His royalism, however, was systematically attacked after January 1792. He was arrested on Aug. 29, 1792, and imprisoned at Grenoble; on November 3 he was transferred to Paris, where he was tried (Nov. 28, 1793) and executed.

Barnave's *Introduction à la révolution française* ("Introduction to the French Revolution"), written during his imprisonment at Grenoble, is considered a major document of the Revolution. The work, in which he outlines the "natural history" of society's evolution toward the hegemony of the middle class, was one of the first attempts to place the French Revolution into a broad scheme of political, legal, and social history.

Barnburners: see Hunkers and Barnburners.

Barnes, Albert C(oombs) (b. Jan. 2, 1872, Philadelphia, Pa., U.S.—d. July 24, 1951, Chester county, Pa.), American inventor of the antiseptic Argyrol and noted art collector, whose collection resides in the Barnes Foundation galleries in Merion, outside Philadelphia.

Barnes grew up in poverty in South Philadel-

phia but managed to attend the University of Pennsylvania Medical School (M.D., 1892), supporting himself by tutoring, playing semiprofessional baseball, and boxing. Beginning in 1896, he attended schools in Germany to study advanced chemistry, and, when he returned to Philadelphia, he and a German chemist, Herman Hille, devised the formula for Argyrol, from which Barnes made a fortune. He bought out his partner in 1907 and formed the pharmaceutical A.C. Barnes Company (which he would sell very profitably in 1928).

In 1905 he built a mansion in Merion and began collecting paintings. In 1912 he commissioned a former high-school classmate to collect some modern paintings in France and was sufficiently impressed to begin his own personal buying trips to Paris; he never again used an intermediary. His richest trip was in 1922–23, when he collected more than a hundred paintings. Over the years his collection grew to include 180 paintings by Pierre-Auguste Renoir, 60 by Henri Matisse, 59 by Paul Cézanne, 35 by Pablo Picasso, and more than a thousand other art treasures. The Barnes Foundation, housed in quarters next to his Merion home, was chartered on Dec. 4, 1922, to contain his collection and to promote art education by providing art classes taught by a full-time staff and by establishing a publishing program. (Barnes himself wrote and coauthored a number of books on art.)

Barnes had a reputation for being paternalistic and hot-tempered and engaged in a number of public rows with employees, art critics, and museums. He died in an auto accident. After extensive litigation, his galleries were opened to the public in 1961.

BIBLIOGRAPHY. Howard Greenfeld, *The Devil and Dr. Barnes: Portrait of an American Art Collector* (1987), chronicles the collector's educational philosophy, friendships, and eccentric behaviour.

Consult the INDEX first

Barnes, Barnabe (b. 1569?, Yorkshire, Eng.—d. 1609), Elizabethan poet, one of the Elizabethan sonneteers and the author of *Parthenophil and Parthenophe*.

Barnes was the son of Richard Barnes, bishop of Durham. He entered Brasenose College, Oxford, in 1586 but took no degree; in 1591 he joined the expedition to Normandy led by the Earl of Essex. On his return he published *Parthenophil and Parthenophe* (1593), containing sonnets, madrigals, elegies, and odes, on which rests his claim to fame. In 1598 he was prosecuted in the Star Chamber on a charge of attempted poisoning, but he escaped to the north. His other works include *A Divine Century of Spiritual Sonnets* (1595), *Four Books of Offices* (1606) in prose, and two plays, *The Battle of Hexham* (now lost) and the anti-Roman Catholic *The Devil's Charter* (1607). At his best his poems, particularly the madrigals, have exuberance and occasional felicity of language; the sonnets show French influence.

Barnes, George Nicoll (b. Jan. 2, 1859, Dundee, Scot.—d. April 21, 1940, London, Eng.), trade-union leader, socialist, a founder (1900) and chairman (1910) of the British Labour Party, and member of David Lloyd George's coalition ministry during World War I.

A clerk in a jute mill at the age of 11, Barnes later became an engineer and was assistant secretary (1892–96) and general secretary (1896–1908) of the Amalgamated Society of Engineers. He led a nationwide strike (July 1897–January 1898) of the engineers, at that time the strongest labour union in Great Britain.

George Barnes, detail of an oil sketch by Sir James Guthrie; in the Scottish National Portrait Gallery, Edinburgh

By courtesy of the Scottish National Portrait Gallery, Edinburgh

Although forced to capitulate in its demands for an eight-hour working day, the union established the principle of collective bargaining over employment conditions.

Barnes sat in the House of Commons as a Labour member from 1906 until his retirement from politics in 1922. Under Lloyd George, he served as minister of pensions (1916–17) and minister without portfolio (1917–20), with a seat in the War Cabinet (1917–19). Late in 1918, when Labour withdrew its support of the coalition, he resigned from the party in order to retain office and take part in the peace treaty negotiations. He was responsible for establishing the International Labour Organisation (ILO) as an agency of the League of Nations.

Barnes, Robert (b. 1495, Lynn, Norfolk, Eng.—d. July 30, 1540, London), English Lutheran who was martyred after being used by King Henry VIII to gain support for his antipapal campaign in England.

Barnes, a prior of the Austin Friars at Cambridge, was early influenced by reformist views and ruined a promising academic career when on Christmas Eve, 1525, he preached a sermon attacking clerical worldliness. Pressure from the university authorities caused him officially to abjure his heretical opinions, but in 1528 he escaped to Wittenberg, in Germany, where he formed an enduring friendship with Martin Luther. Beginning in 1531 Henry VIII's chief minister, Thomas Cromwell, obtained for Barnes safe conduct for frequent diplomatic trips between Germany and England. Henry and Cromwell seem to have had no respect for Barnes; instead, they exploited his close contact with the Lutherans in order to bolster their drive to make the king, rather than the pope, the head of the church in England.

The fall of Cromwell in June 1540 removed Barnes's sole protector; in July he was burned as a heretic, though he had never been accorded a trial. Historians have generally viewed him as a sincere but rash and somewhat unstable man. His most important writings are *A Supplication to Henry VIII* (1531), *Vitae Romanorum Pontificum* (1535; "Lives of the Roman Pontiffs"), and *Confession of Faith* (1540).

Barnes, Thomas (b. Sept. 16, 1785, London, Eng.—d. May 7, 1841, London), British journalist who as editor of *The Times* for many years established its reputation and founded a tradition of independent journalism.

The son of a solicitor, Barnes was educated at Christ's Hospital and at Pembroke College, Cambridge. After studying in the chambers of Joseph Chitty, he abandoned the idea of being called to the bar and began writing on literature, theatre, and politics in his friend Leigh Hunt's *Reflector* and *Examiner* and in John Scott's *Champion*, to which he contributed literary portraits under the pseudonym "Strada." His political sketches in the *Examiner* were collected and published anonymously as *Par-*

liamentary Portraits in 1815. Meanwhile, he had also been contributing to *The Times*; and in 1817 he was appointed to the editorship, which he held until his death. Despite ill health and somewhat intemperate habits, Barnes brought *The Times* from comparative obscurity to the position of Britain's leading newspaper.

Barnes exerted his considerable influence in favour of the Reform bill and acquired for himself and his paper the nickname "the Thunderer." In 1834 he was described by the lord chancellor Lord Lyndhurst as "the most powerful man in the country." Barnes first collaborated but later quarreled with Lord Brougham. Barnes sponsored Benjamin Disraeli's "Letters to Statesmen," signed "Runnymede" (1836–39).

Barnes, William (b. Feb. 22, 1801, Bagber, near Sturminster Newton, Dorsetshire, Eng.—d. Oct. 7, 1886, Winterbourne Came, Dorsetshire), English dialect poet whose work gave a simple and sincere picture of the life and labour of rural southwestern England. A gifted philologist, his linguistic theories as well as his poetry influenced two major writers, Thomas Hardy and Gerard Manley Hopkins.

William Barnes, portrait by G. Stuckey, c. 1870; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

After leaving school at 15, Barnes worked for a solicitor, studied classics with local clergymen, opened a school in 1823, and was ordained a priest in 1848. His first Dorset dialect poems were published in the *Dorset County Chronicle* (1833–34). His many books include an Anglo-Saxon primer, *An Outline of English Speech-Craft* (1878), *Poems of Rural Life in Common English* (1868), *Poems of Rural Life* (two series: 1844, 1862), and *Hwomely Rhymes* (1859).

Barnet, outer borough of Greater London, on the northwestern perimeter of the metropolis. It was formed by the amalgamation in 1965 of

Chipping Barnet Church in Barnet, London
A F Kersting

the former boroughs of Hendon and Finchley and the urban districts of Barnet, East Barnet, and Friern Barnet. These once formed separate manors and ecclesiastical parishes. The borough is now almost entirely residential, but some industry is concentrated along the Edgware Road, its western boundary. Before the advent of railways in the mid-19th century, the area was almost entirely agricultural. The population then began to rise sharply, and estates and farms were replaced by brick Victorian villas. Development accelerated during the 1920s and '30s with expansion of the London Underground (subway) network.

Few notable old buildings remain; but Chipping Barnet Church dates from 1250, and Monken Hadley parish church has a tower that was rebuilt in 1494. East Barnet parish church dates from 1100, and there are Norman traces in the Hendon parish church of St. Mary. The training college and driving school of the Metropolitan Police Force are near the former Hendon Military Airfield (closed 1957), which now houses the Royal Air Force Museum. There are two colleges of higher education, one at Barnet and a college of technology at Hendon. Barnet's grammar school dates from 1573. There are local history museums at Wood Lane, Barnet, and at Greyhound Hill, Hendon. The borough covers an area of 34 square miles (89 square km). Pop. (1998 est.) 331,500.

Barnet, Battle of (April 14, 1471), in the English Wars of the Roses, a momentous victory for the Yorkist king Edward IV over his Lancastrian opponents, the adherents of Henry VI. It was fought around Hadley Green, now in East Barnet, just north of London, on Easter Day. Edward, in power since 1461, had in 1470 been driven into exile when his main supporter, Richard Neville, Earl of Warwick, changed sides and restored Henry VI. Returning to England in March 1471, Edward seized London and the person of Henry VI and then moved north to meet Warwick's advance from Coventry. Warwick chose his positions on April 13. Edward, with his brother the Duke of Gloucester (afterward King Richard III), arrived later, spent the night close to the enemy, and attacked at dawn. Although Edward's left flank was routed, his right and his centre were victorious. Warwick, who had fought on foot to avert suspicion that he would desert his men, was killed while fleeing. The defeat a month later of an army led by Henry VI's queen, Margaret of Anjou, and their son at the Battle of Tewkesbury and Henry's death in captivity left Edward secure until his own death in 1483.

Barnett, Samuel A(ugustus) (b. Feb. 8, 1844, Bristol, Gloucestershire, Eng.—d. June 17, 1913, London), Anglican priest and social reformer who founded building programs and cultural centres (notably Toynbee Hall, 1884, which Barnett served as its first warden) in London's impoverished East End. In his teaching and writings he advanced a doctrine of Christian Socialism. Barnett House, Oxford, a centre for the study of social sciences, was founded in his memory. Among his works is *Practicable Socialism* (1888), written with his wife, Henrietta Octavia Rowland, who was also active in Barnett's social reform efforts.

Barni, Ziyā'-ud-Dīn: see Baranī, Ziyā'-ud-Dīn.

Barnsley, town and metropolitan county borough, metropolitan county of South Yorkshire, historic county of Yorkshire, England. Situated on the River Dearne, a tributary of the Don, it is an old market town and had early wire-drawing and linen industries, but its major growth came in the 19th century as a coal-mining town in the heart of the Yorkshire coalfield. Local coal production was at its peak at the beginning of the 20th century, and, as mining employment was

subsequently reduced, engineering, clothing, and other light industries have been promoted. Barnsley has a new mining and technical college and still functions as an agricultural market and service centre. Area 127 square miles (329 square km). Pop. (1991) town, 75,120; (1998 est.) metropolitan borough, 228,100.

Barnstable, city, Barnstable county, southeastern Massachusetts, U.S. It is situated between Cape Cod Bay and Nantucket Sound, on the "bicep" of Cape Cod. It was settled in 1638 by farmers who were attracted to the site by salt hay found in the surrounding marshes, and in 1685 it was designated the county seat. During the 18th century, Barnstable was a thriving port for the New England molasses and rum trade. Since 1900 its economy has depended on summer tourism supplemented by fishing, oyster culture, and cranberry farming. Seven villages make up the city, including Hyannis, which is the main business centre and the site of the Kennedy family compound at Hyannis Port (Hyannisport) as well as the John F. Kennedy Hyannis Museum. The other villages are West Barnstable, Osterville, Marstons Mills, Cotuit, Canterville, and Barnstable Village. The city is the site of the Sturgis Library (1867), the Crocker Tavern (1754, now a museum), and the Donald G. Trayser Memorial Museum (Old Customs House, built in 1856). Barnstable was the birthplace of the political activist James Otis, Jr., and the 19th-century jurist Lemuel Shaw. Inc. town, 1639; city, 1989. Pop. (2000) city, 47,821; Barnstable-Yarmouth MSA, 162,582.

Barnstaple, town ("parish"), North Devon district, administrative and historic county of Devon, England. It lies on the north bank of the Taw Estuary, about 10 miles (16 km) from the Bristol Channel. The Taw is spanned by a 15th-century stone bridge (widened in 1796 and 1962). The town was walled in the early 12th century and incorporated in 1557. Barnstaple imported wool from Ireland, which, together with local wool, was made into cloth. Silting of the estuary led to the decline of the port, but the town revived in the railway age. Barnstaple has a few light industries, including pottery manufacture, mainly for the tourist trade, and serves as the main service centre of the district. Pop. (1991) 27,691.

Barnum, P(hineas) T(aylor) (b. July 5, 1810, Bethel, Conn., U.S.—d. April 7, 1891, Bridgeport, Conn.), American showman who employed sensational forms of presentation and publicity to popularize such amusements as the public museum, the musical concert, and the three-ring circus. In partnership with James A. Bailey, he made the American circus a popular and gigantic spectacle, the so-called Greatest Show on Earth.

Barnum was 15 years old when his father died, and the support of his mother and his

Barnum

five sisters and brothers fell largely upon his shoulders. After holding a variety of jobs, he became publisher of a Danbury, Conn., weekly newspaper, *Herald of Freedom*. Arrested three times for libel, he enjoyed his first taste of notoriety.

In 1829, at the age of 19, Barnum married a 21-year-old Bethel woman, Charity Hallett, who was to bear him four daughters. In 1834 he moved to New York City, where he found his vocation as a showman one year later when he successfully presented Joice Heth, a wizened black woman whom he advertised as the 161-year-old nurse to General George Washington. This human relic, on her death, was exposed as a hoax.

Casting about for a legitimate undertaking, Barnum outmaneuvered wealthier bidders to acquire John Scudder's American Museum, in New York City, a five-story marble structure filled with stuffed animals, waxwork figures, and similar conventional exhibits. The new owner rapidly transformed the museum into a carnival of live freaks, dramatic theatricals, beauty contests, and other sensational attractions. Although driven at the outset of his career by a desire for wealth and fame, Barnum may have been basically motivated by less selfish reasons. "This is a trading world," he wrote, "and men, women and children, who cannot live on gravity alone, need something to satisfy their gayer, lighter moods and hours, and he who ministers to this want is in a business established by the Author of our nature." Playing upon the public's interest in the unusual and bizarre, Barnum scoured the world for curiosities, living or dead, genuine or fake. By means of outrageous stunts, repetitive advertising, and exaggerated publicity, Barnum excited international attention and made his showcase of wonders a landmark.

Between 1842, when he took over the American Museum, and 1868, when he gave it up after fires twice had all but destroyed it, Barnum's gaudy showmanship enticed 82 million visitors into his halls and to his other enterprises, among them Henry and William James, Charles Dickens, and Edward VII, then Prince of Wales.

Barnum's first successful exhibit in the museum was the Feejee Mermaid, which had a seemingly human head topping the finned body of a fish and was, of course, found later to be a fake. Among the genuine curiosities were Chang and Eng, Siamese twins connected by a ligament below their breastbones. It was, however, Charles S. Stratton, a man only 25 inches tall who was discovered by Barnum, that proved to be his most profitable exhibit. Ballyhooing Stratton as General Tom Thumb, Barnum sold 20 million tickets to the museum. After being received by President Abraham Lincoln, Barnum and Tom Thumb enjoyed a triumphal tour abroad, during which the latter gave a command performance before Queen Victoria.

Eager to change his image from promoter of freaks to impresario of artistic attractions, Barnum risked his entire fortune by importing Jenny Lind, a Swedish soprano whom he had never seen or heard and who was almost unknown in the United States. Dubbing Lind "The Swedish Nightingale," Barnum mounted the most massive publicity campaign he had ever attempted. Jenny Lind's opening night in New York, before a capacity audience of 5,000, and her nine months of concerts across the United States earned immense sums.

At the peak of his career, Barnum's own appearance was nearly as familiar to the public as the exhibits he promoted. An impressive figure six feet two inches tall, semibald, with blue eyes, a bulbous nose, and potbelly, he called himself the "Prince of Humbugs." He dwelt in a three-story Oriental mansion,

named Iranistan, on a 17-acre estate in Bridgeport, Conn., where he played host to such notables as Mark Twain, Horace Greeley, and Matthew Arnold. Close friends regarded him as good-natured, thoughtful, and kind, as well as parsimonious and egotistical.

His avocations were politics and writing. After serving two terms in the Connecticut state legislature, he was elected mayor of Bridgeport, in which post he fought prostitution and union discrimination against Negroes. In 1855 he published his autobiography, *The Life of P.T. Barnum, Written by Himself*; and because he frankly revealed some of the deceits he had employed, he was harshly taken to task by the majority of critics. Stung, Barnum continually modified the book in many revised versions, which, he claimed, sold a total of 1,000,000 copies. By 1884, more anxious for publicity than for profit, Barnum placed his autobiography in the public domain, allowing anyone to print and sell it without copyright infringement. Though the cynicism "There's a sucker born every minute" has long been attributed to Barnum, there is no proof that he ever wrote or spoke these words.

Barnum's family life was not entirely happy. One daughter had died in childhood; another was dropped from his will for committing adultery. Disappointed because he had no male heir, Barnum left a sizable bequest to a grandson on the condition that he agree to use the name of Barnum as part of his name. After 44 years of marriage, Charity Barnum died in 1873. The following year, Barnum, who was then 64, took the 24-year-old Nancy Fish, the daughter of a British admirer, for his second wife.

Although his name has been popularly linked with the circus, Barnum did not, in fact, become a circus showman until he was past the age of 60. Barnum did not invent the modern circus, but, in partnership with the retiring, efficient James A. Bailey, he did give the American spectacle its gigantic size, its most memorable attractions, and its widest popularity, attempting to make it what he called "the greatest show on earth." Barnum capped his circus career by purchasing a 6½-ton elephant named Jumbo, who quickly earned back his purchase price during his first season under the big top.

In his 81st year, Barnum fell gravely ill. At his request, a New York newspaper published his obituary in advance so that he might enjoy it. Two weeks later, after inquiring about the box office receipts of the circus, Barnum died in his Connecticut mansion. *The Times* of London echoed the press of the world in its final tribute. ". . . He created the *métier* of showman on a grandiose scale. . . . He early realized that essential feature of a modern democracy, its readiness to be led to what will amuse and instruct it. . . . His name is a proverb already, and a proverb it will continue." (Ir.W.)

barnyard grass (*Echinochloa crus-galli*), coarse annual grass of the family Poaceae (Gramineae) and one of about 20 species comprising the genus *Echinochloa*. The common

Barnyard grass (*Echinochloa crus-galli*)

J.C. Allen and Son

name also applies to a similar species, *E. muricata*, not considered a separate species by some authorities.

Barnyard grass is distributed throughout much of North America as a weed in moist cultivated and waste areas. It has been variously known as barn grass and barnyard millet.

Baro, town and river port, Niger State, west central Nigeria, on the Niger River, 400 mi (650 km) from the sea. Originally a small village of the Nupe people, it was selected by the British as Nigeria's link between rail and river transport; its solid bank—rare along the Lower Niger—could be used for loading river craft with Northern Nigeria's cotton crop. Although the 350-mi Baro-Kano railway was completed in 1911, it was shortly eclipsed in importance by a railroad built farther north, and the Baro Kano line is no longer in use. From July to March, however, Baro is still used to ship peanuts (groundnuts) and cotton downstream to the Niger Delta ports of Burutu and Warri.

Most of the town's local trade is in sorghum, yams, rice, millet, fish, palm oil, shea nuts, peanuts (groundnuts), and cotton. Swamp rice is cultivated commercially both by farmers in the vicinity and at the government's irrigated rice projects at Loguma (10 mi northwest) and Badeggi (35 mi northwest).

baro-otitis: see ear squeeze.

Barocci, Federico, Barocci also spelled BAROCCIO or BARROCIO, also called FIORI DA URBINO (b. c. 1526, Urbino, Duchy of Urbino, Papal States—d. 1612, Urbino), leading painter of the central Italian school in the last decades of the 16th century and an important precursor of the Baroque style.

Although he made two visits to Rome—one in about 1550 to study the works of Raphael, and another in 1560 when he worked on the frescoes for Pope Pius IV's Casino in the Vatican Gardens—Barocci lived and worked all his life in Urbino and the surrounding small towns. He executed altarpieces and devotional paintings for local churches and patrons such as the Duke of Urbino and, in time, the cathedrals of Genoa and Perugia.

Barocci may have never seen an original Correggio, yet Correggesque motifs appear in his compositions. Warmth of feeling, tenderness of expression, and a painterly (as opposed to a draftsman-like) approach are

common to the work of both artists. This is particularly evident in the many paintings by Barocci on the theme of the Madonna; two of the most famous are the "Madonna del Popolo" (1579) and the exquisitely beautiful "Nativity" (1597). Barocci was unusual in the Mannerist period for his numerous and ex-

"Nativity," oil painting by Federico Barocci, 1597; in the Prado, Madrid

By courtesy of Museo del Prado, Madrid

tremely sensitive life drawings. His distinctive use of colour is central Italian in origin—pale, fugitive colours blended chiefly from vermilion pinks, mother-of-pearl whites, and grays.

Baroda (India): see Vadodara.

Baroja (y Nessi), Pío (b. Dec. 28, 1872, San Sebastián, Spain—d. Oct. 30, 1956, Madrid), Basque writer who is considered to be the foremost Spanish novelist of his generation.

After receiving his medical degree, Baroja practiced medicine for a short time in a village in northern Spain, later returning to Madrid to work in the family bakery. As a

Baroja

Archo Mas, Barcelona

member of the Generation of '98 (*q.v.*), Baroja revolted against the stultification of Spanish life. His first two books, a collection of short stories, *Vidas sombrías* (1900; "Sombre Lives"), and a novel, *La casa de Aizgorri* (1900; *The House of the Aizgorri*, 1958), clearly show the direction his later work would take. Attempting to arouse people to action, he wrote 11 trilogies dealing with contemporary social problems, the best known of which, *La lucha por la vida* (1904; *The Struggle for Life*, 1922-24), portrays the misery and squalor in the poor sections of Madrid. Himself a confirmed rebel and nonconformist, Baroja wrote at length

about vagabonds and people who reflected his own thinking; *El árbol de la ciencia* (1911; *The Tree of Knowledge*, 1928) is considered to be basically autobiographical. Of the almost 100 novels he wrote, the most ambitious project was *Memorias de un hombre de acción* (1913–28; "Memoirs of a Man of Action"), a series of 14 novels and 8 volumes of shorter narratives dealing with a 19th-century insurgent and his era. One of his best novels, *Zalacain el aventurero* (1909), is written in an intentionally abrupt style reflecting Baroja's vision of reality as disjointed.

Because of his anti-Christian views, his stubborn insistence on nonconformity, and a somewhat pessimistic attitude, Baroja's novels never achieved great popularity. His terse and unadorned style, which relied heavily upon understatement, is said to have had great influence on Ernest Hemingway.

barometer, device used to measure atmospheric pressure. Because atmospheric pressure changes with distance above or below sea level, a barometer can also be used to measure altitude. There are two main types of barometers: mercury and aneroid.

In the mercury barometer, atmospheric pressure balances a column of mercury, the height of which can be precisely measured. To increase their accuracy, mercury barometers are often corrected for ambient temperature and the local value of gravity. Common pressure units include pounds per square inch; dynes per square centimetre; newtons per square metre (the SI unit called the pascal); inches, centimetres, or millimetres of mercury; and millibars (1 millibar equals 1,000 dynes per square centimetre, or 0.75 millimetre of mercury). Normal atmospheric pressure is about 14.7 pounds per square inch, equivalent to 30 inches (760 millimetres) of mercury, 1,013.2 millibars, or 101,320 pascals.

Of the many different varieties of mercury barometers, most variations arise from different techniques for measuring the height of the mercury column. Though other liquids can be used in a barometer, mercury is the most common. Its density allows the vertical column of the barometer to be of manageable size. If water were used, for instance, the column would have to be 34 feet high.

A nonliquid barometer called the aneroid barometer is widely used in portable instruments and in aircraft altimeters because of its smaller size and convenience. It contains a flexible-walled evacuated capsule, the wall of which deflects with changes in atmospheric pressure. This deflection is coupled mechanically to an indicating needle. A mercury barometer is used to calibrate and check aneroid barometers. Calibration can be, for example, in terms of atmospheric pressure or altitude above sea level.

A barometer that mechanically records changes in barometric pressure over time is called a barograph. Though mercury barographs have been made, aneroid barographs are much more common. The motion of the aneroid capsule is magnified through levers to drive a recording pen. The pen traces a line on a graph that is usually wrapped around a cylinder driven by a clockwork mechanism.

barometric light, luminous glow appearing in the vacuum above the mercury in a barometer tube when the tube is shaken, first noticed in 1675 by a French astronomer, Jean Picard. The electrical discharge takes place with a variety of rarefied gases trapped in the tube (neon glows with its characteristic red light even at atmospheric pressure). The shaking is essential; electrification is probably produced both by the splashing of the mercury and by its movement over the glass surface. Impurities in the mercury considerably influence the phenomenon of barometric light, never exhaustively investigated. Francis Hauksbee in 1709 proved that the effect occurred in other

than glass containers, did not require an extremely low pressure, and was similar to discharges produced by his electrical machine.

barometric pressure: see atmospheric pressure.

baron, feminine BARONESS, title of nobility, ranking in modern times immediately below a viscount or a count (in countries without viscounts). Originally, in the early Middle Ages, the term baron designated a tenant of whatever rank who held a tenure of barony direct from the king. Gradually, however, the word came to mean a powerful personage and, therefore, a magnate.

Baron, baroness

Spanish	barón	baronesa
Swedish	friherre	friherrinna

France. In 12th-century France the term *baron*, in a restricted sense, was applied properly to all lords possessing an important fief, but toward the end of the 13th century the title had come to mean that its bearer held his principal fief direct from the crown and was therefore more important than that of count, since many counts were only mediate vassals. From this period, however, the title tended to sink in importance. In the 14th century the barons were ranked below counts and viscounts, though in power and possessions many barons were superior to many counts. In any case, until the 17th century the title of baron could be borne only by the holder of a territorial barony, and it was Louis XIV who first cheapened the title in France by creating numerous barons by royal letters. The creation of barons was later revived by the Emperor Napoleon, continued by Louis XVIII, Charles X, and Louis Philippe, and revived again on a generous scale by Napoleon III. Since 1870 the tolerant attitude of the French republican governments toward titles, which are not officially recognized, has increased the confusion by facilitating the assumption of the title on very slender grounds of right.

Germany. The German equivalent of baron, *Freiherr*, or "free lord" of the empire, originally implied a dynastic status, and many *Freiherren* held countships without taking the title of count (*Graf*). When the more important of them styled themselves counts, the *Freiherren* sank into an inferior class of nobility. The practice of conferring the title *Freiherr* by imperial letters—begun in the 16th century by the emperor Charles V—was later exercised by all the German sovereigns.

Italy. In the Middle Ages the Italian barons had extensive powers of jurisdiction within their domains and could inflict the death penalty. There was a right of appeal, but it was of little value and in Sicily and Sardinia was nonexistent. In the late Middle Ages the barons' powers became more extensive, especially in the south, and they had the right to mint money and wage private war. The title was recognized until 1945.

Spain. In early medieval Navarre and Aragon *barón* described the senior nobility but

later, perhaps under the influence of Castilian practice, it was displaced by *ricos hombres* ("rich men"). In Catalonia a baron was simply a magnate but in the later Middle Ages achieved a distinct status even more important than the French barons. Some nobles retained the title until it was abolished by the *Cortes* of Cadiz in 1812.

England. In the 11th and early 12th centuries all English tenants in chief were known as barons and their reliefs regulated more or less according to the size of their estates. By the year 1200, however, the barons were coming to be regarded as a distinct class and were even roughly divided between "greater" and "lesser" baronies.

Thus far the barons' position was connected with the tenure of land. The great change in their status was effected when their presence in that council of the realm that became the House of Lords was determined by the issue of a writ of summons, dependent not on the tenure of land but only on the king's will. This change occurred under Edward I, although those who received such summons were not as yet distinguished from commoners by any style or title. The style of baron was first introduced by Richard II in 1387, when he created John Beauchamp, by patent, lord de Beauchamp and baron of Kidderminster. Such creations became common under Henry VI but "Baron" as a form of address could not evict "Lord." To this day a baron is addressed in correspondence as "the Lord A," although other peers under the rank of duke are spoken of as "lords," while they are addressed in correspondence by their proper styles. To speak of "Baron A" is an unhistorical and quite recent practice. When a barony, however, is vested in a lady, it is now the recognized custom to speak of her as baroness; e.g., Baroness Berkeley.

Baron, Michel (b. Oct. 8?, 1653, Paris—d. Dec. 22, 1729, Paris), actor, from 1670 until his retirement in 1691 the undisputed master of the French stage.

The child of theatrical parents, he was orphaned at the age of 12 and joined the company of children known as the *Petits Comédiens du Dauphin*. He joined Molière's company in 1670 and was treated like a son by the master. He later became a member of the company at the *Hôtel de Bourgogne* and subsequently of the newly formed *Comédie-Française*. He created many of the leading roles in Racine's tragedies, besides those in two of his own comedies, *L'Homme à bonnes fortunes* (1686; "The Don Juan") and *La Coquette et la fausse prude* (1687; "The Flirt and the False Prude"). He retired in 1691 but in 1720 returned to the *Comédie-Française*.

His son Étienne-Michel Baron (1676–1711) was also an actor and left a son and two daughters, all of whom played at the *Comédie-Française*.

Barone, Enrico (b. Dec. 22, 1859, Naples—d. May 14, 1924, Rome), Italian mathematical economist who expanded on the ideas of economist Léon Walras regarding general equilibrium theory.

Barone spent much of his life as an army officer, only resigning from the army in 1907 after obtaining a professorship at the University of Rome. His main contributions, however, were largely made before that date. Walras proposed a mathematical model which demonstrated that products and prices automatically adjust in equilibrium. Barone further developed the general equilibrium structure of Walras to include variable combinations of inputs in production. Barone also worked on the marginal productivity theory of distribution independently of British economist Philip Wicksteed. However, he was persuaded

by Vilfredo Pareto, the Italian economist and sociologist, that his approach to distribution was invalid.

One of his most important contributions to economic theory was his demonstration that a collectivist economy could plan production rationally, thereby achieving economic equilibrium (comparable to the equilibrium theory of a competitive economy developed by Walras). He believed he had solved the problems of attainment of equilibrium, at least in principle, by the introduction of the concept of a trial-and-error process to achieve correct prices. Barone also contributed to international-trade theory.

baronet, British hereditary dignity, first created by King James I in May 1611. The baronetage is not part of the peerage, nor is it an order of knighthood. A baronet ranks below barons but above all knights except a knight of the garter. The baronetcy is inherited by the male heirs of a baronet.

James I, desperate for funds like all the Stuarts, decided to institute by letter patent "a new dignitie between Barons and Knights." Because the money was ostensibly for support of the troops in Ulster, candidates for the baronetage were required to pay the king £1,095 (the sum required to maintain 30 soldiers for three years), but such requirements were soon abandoned. In 1619 a baronetage of Ireland was also established, and in 1624 James planned another creation in connection with the plantation of Nova Scotia. This was carried out after his death by Charles I in 1625. The baronets of Scotland (or of Nova Scotia) were required to pay a total of £2,000 (the amount required to support six colonists) and to pay a fee of £1,000 to Sir William Alexander (afterward earl of Stirling), to whom the province had been granted in 1621. In return they received, as well as their title, 16,000 acres of land in Nova Scotia. The creation of baronets of Scotland ceased with that country's union with England in 1707; thereafter, until 1800, the new baronetcies were those of Great Britain. No more Irish baronets were created after the Irish Act of Union in 1801. From 1801 all creations were of baronets of the United Kingdom.

Baronetcies are conferred only on men, though women may succeed to certain Scottish baronetcies. A baronet is styled Sir A.B., Bart. (or Bt.), to distinguish him from a knight; his wife is Lady B. A Scottish baroness is styled Dame A.B., Bart., or Lady A.B., Bart.

Baronius, Caesar (b. Oct. 31, 1538, Sora, Kingdom of Naples [now in Italy]—d. June 30, 1607, Rome), ecclesiastical historian and apologist for the Roman Catholic Church.

He joined the Oratory in Rome in 1557, eventually succeeding Philip Neri as superior in 1593. Clement VIII, whose confessor he was, made him cardinal in 1596, and in the following year he became Vatican librarian.

His major work, the *Annales Ecclesiastici* (1588–1607), undertaken in reply to the *Centuria Magdeburgenses* and under the inspiration of Philip, consists of 12 folios narrating the history of the church down to the year 1198. Hailed by Roman Catholic writers as the "father of ecclesiastical history," Baronius was scorned by Protestant critics for his ignorance of Hebrew and poor knowledge of Greek. It was claimed that he had made numerous factual errors. The chief merit of the *Annales* lies in its enormous accumulation of sources—some not previously published. The most useful edition of the *Annales* is by A. Theiner (37 vol., 1864–83).

Barons' War (1264–67), in English history, the civil war caused by baronial opposition to the costly and inept policies of Henry III.

The barons in 1258 had attempted to achieve reform by forcing Henry to abide by the Provisions of Oxford (*see* Oxford, Provisions of). When, by the Mise of Amiens (1264), the Provisions of Oxford were declared invalid by Louis IX of France, some barons, led by Simon de Montfort, took up arms and, in May 1264, captured the king at the Battle of Lewes in the southeastern Downs. From then until his death at the Battle of Evesham in August 1265, Simon de Montfort largely controlled England and made important administrative and parliamentary experiments. A settlement was achieved by the Dictum of Kenilworth (1266) and finally by the Statute of Marlborough (1267), which remedied some of the baronial grievances.

baroque pearl, pearl that is irregularly or oddly shaped. Pearl formation does not always occur in soft-tissue areas, where the expanding pearl sac grows regularly because it encounters no appreciable resistance. Pearl cysts are sometimes lodged in muscular tissue, for example, where, unable to overcome the resistance of tough muscle fibres, they assume irregular or unusual shapes.

Baroque pearls were highly prized by Renaissance jewelers, who saw them not as misshapen products of sea mollusks but rather as unique and exquisite natural forms. They were often used in pieces of jewelry to form the bodies of figures. A superb example is a piece from the 16th century known as the Canning Jewel (Victoria and Albert Museum, London), in which a large baroque pearl is used for the torso of a sea figure having the body of a man and the tail of a fish, the whole mounted in enameled gold set with pearls, rubies, and diamonds. *See also* pearl.

Baroque period, era in the history of the Western arts roughly coinciding with the 17th century. Its earliest manifestations, which occurred in Italy, date from the latter decades of the 16th century, while in some regions, notably Germany and colonial South America, certain of its culminating achievements did not occur until the 18th century. The work that distinguishes the Baroque period is stylistically complex, even contradictory. In general, however, the desire to evoke emotional states by appealing to the senses, often in dramatic ways, underlies its manifestations. Some of the qualities most frequently associated with the Baroque are grandeur, sensuous richness, drama, vitality, movement, tension, emotional exuberance, and a tendency to blur distinctions between the various arts.

The term Baroque probably ultimately derived from the Italian word *barocco*, which was a term used by philosophers during the Middle Ages to describe an obstacle in schematic logic. Subsequently the word came to denote any contorted idea or involuted process of thought. Another possible source is the Portuguese word *barroco* (Spanish *barruco*), used to describe an irregular or imperfectly shaped pearl, and this usage still survives in the jeweler's term baroque pearl. In art criticism the word Baroque came to be used to describe anything irregular, bizarre, or otherwise departing from established rules and proportions. This biased Neoclassical view of 17th-century art styles was held with few modifications by critics from Johann Winckelmann to John Ruskin and Jacob Burckhardt, and until the late 19th century the term always carried the implication of odd, grotesque, exaggerated, and overdecorated. It was only with Heinrich Wölflin's pioneer study *Renaissance und Barock* (1888) that *Baroque* was used as a stylistic designation rather than as a term of thinly veiled abuse, and a systematic formulation of the characteristics of Baroque style was achieved.

Because the arts present such diversity within the Baroque period, their unifying characteristics must be sought in relation to the era's

broader cultural and intellectual tendencies, of which three are most important for their effect on the arts. The first of these was the emergence of the Counter-Reformation and the expansion of its domain, both territorially and intellectually. By the last decades of the 16th century the refined, courtly style known as Mannerism had ceased to be an effective means of expression, and its inadequacy for religious art was being increasingly felt in artistic circles. To counter the inroads made by the Reformation, the Roman Catholic Church after the Council of Trent (1545–63) adopted a propagandistic stance in which art was to serve as a means of extending and stimulating the public's faith in the church. To this end the church adopted a conscious artistic program whose art products would make an overtly emotional and sensory appeal to the faithful. The Baroque style that evolved from this program was paradoxically both sensuous and spiritual; while a naturalistic treatment rendered the religious image more accessible to the average churchgoer, dramatic and illusory effects were used to stimulate his piety and devotion and convey to him an impression of the splendour of the divine. Baroque church ceilings thus dissolved in painted scenes that presented vivid views of the infinite to the observer and directed him through his senses toward heavenly concerns.

The second tendency was the consolidation of absolute monarchies, accompanied by a simultaneous crystallization of a prominent and powerful middle class, which now came to play a role in art patronage. Baroque palaces were built on an expanded and monumental scale in order to display the power and grandeur of the centralized state, a phenomenon best displayed in the royal palace and gardens at Versailles. Yet at the same time the development of a picture market for the middle class and its taste for realism may be seen in the works of the brothers Le Nain and Georges de La Tour in France and in the varied schools of 17th-century Dutch painting.

The third tendency was a new interest in nature and a general broadening of mankind's intellectual horizons, spurred by developments in science and by explorations of the globe. These simultaneously brought to man a new sense both of his own insignificance (particularly abetted by the Copernican displacement of the Earth from the centre of the universe) and of the unsuspected complexity and infinitude of the natural world. The development of 17th-century landscape painting, in which man is frequently portrayed as a minute figure in a vast natural setting, is indicative of this changing awareness of the human condition.

The arts present an unusual diversity in the Baroque period, chiefly because currents of naturalism and classicism coexisted and intermingled with the typical Baroque style. Indeed, Annibale Carracci and Caravaggio, the two Italian painters who decisively broke with Mannerism in the 1690s and thus helped usher in the Baroque style, painted, respectively, in classicistic and realist modes. A specifically Baroque style of painting arose in Rome in the 1620s and culminated in the monumental painted ceilings and other church decorations of Pietro da Cortona, Guido Reni, Il Guercino, Domenichino, and countless lesser artists. The greatest of the Baroque sculptor-architects was Gian Lorenzo Bernini, who designed both the baldachin with spiral columns above the altar of St. Peter's in Rome and the vast colonnade fronting that church. Baroque architecture as developed by Bernini, Carlo Maderno, Francesco Borromini, and Guarino Guarini emphasized massiveness and monumentality, movement, dramatic spatial and lighting sequences, and a rich interior decoration using contrasting surface textures, vivid colours, and luxurious materials to heighten the structure's physical immediacy and evoke sensual delight.

Pronounced classicizing tendencies subdued the Baroque impulse in France, as is evident in the serious, logical, orderly paintings of Nicolas Poussin and the somewhat more sumptuous works of Charles Le Brun and the portraitists Hyacinthe Rigaud and Nicolas de Largillière. French architecture is even less recognizably Baroque in its pronounced qualities of subtlety, elegance, and restraint. Baroque tenets were enthusiastically adopted in staunchly Roman Catholic Spain, however, particularly in architecture. The greatest of the Spanish builders, José Benito Churriguera, shows most fully the Spanish interest in surface textures and lush, albeit meaningless, detail. He attracted many followers, and their adaptations of his style, labeled Churrigueresque, spread throughout Spain's colonies in the Americas and elsewhere. Diego Velázquez and other 17th-century Spanish painters used a sombre but powerful naturalistic approach that bore little direct relation to the mainstream of Baroque painting.

The Baroque made only limited inroads into northern Europe, notably in what is now Belgium. That Spanish-ruled, largely Roman Catholic region's greatest master was the painter Peter Paul Rubens, whose tempestuous diagonal compositions and ample, full-blooded figures are the epitome of Baroque painting. The elegant portraits of Anthony Van Dyck and the robust figurative works of Jacob Jordaens emulated Rubens's example. Art in Holland was conditioned by the realist tastes of its dominant middle-class patrons, and thus both the innumerable genre and landscape painters of that country and such towering masters as Rembrandt and Frans Hals remained independent of the Baroque style in important respects. The Baroque did have a notable impact in England, however, particularly in the churches and palaces designed, respectively, by Sir Christopher Wren and Sir John Vanbrugh.

The last flowering of the Baroque was in largely Roman Catholic southern Germany and Austria, where the native architects broke away from Italian building models in the 1720s. In ornate churches, monasteries, and palaces designed by J.B. Fischer von Erlach, J.L. von Hildebrandt, the Asam brothers, Balthasar Neumann, and Dominikus Zimmermann, an extraordinarily rich but delicate style of stucco decoration was used in combination with painted surfaces to evoke subtle illusionistic effects.

One of the most dramatic turning points in the history of music occurred at the beginning of the 17th century, with Italy again leading the way. While the *stile antico*, the universal polyphonic style of the 16th century, continued, it was henceforth reserved for sacred music, while the *stile moderno*, or *nuove musiche*—with its emphasis on solo voice, polarity of the melody and the bass line, and interest in expressive harmony—developed for secular usage. The expanded vocabulary allowed for a clearer distinction between sacred and secular music as well as between vocal and instrumental idioms, and national differences became more pronounced. The Baroque period in music, as in other arts, therefore, was one of stylistic diversity. The opera, oratorio, and cantata were the most important new vocal forms, while the sonata, concerto, and overture were created for instrumental music. Claudio Monteverdi was the first great composer of the "new music." He was followed in Italy by Alessandro Scarlatti and Giovanni Pergolesi. The instrumental tradition in Italy found its great Baroque composers in Arcangelo Corelli, Antonio Vivaldi, and Giuseppe Tartini. Jean-Baptiste Lully, a major composer of opera, and Jean Philippe Rameau were the masters of Baroque music in France. In England the total theatrical experience of the Stuart masques was followed by the achievements in vocal music of the German-born,

Italian-trained George Frideric Handel, while his countryman Johann Sebastian Bach developed Baroque sacred music in Germany. Other notable German Baroque composers include Heinrich Schütz, Dietrich Buxtehude, and Georg Philipp Telemann.

The literature that may specifically be called Baroque may be seen most characteristically in the writings of Giambattista Marino in Italy, Luis de Góngora in Spain, and Martin Opitz in Germany. English Metaphysical poetry, most notably much of John Donne's, is allied with Baroque literature. The Baroque period ended in the 18th century with a transition of its characteristic style into the lighter, less dramatic, more overtly decorative Rococo style.

Barossa Valley, important wine-producing region of South Australia, located 30 miles (48 km) northeast of Adelaide in the Mount Lofty Ranges. The valley, drained by the North Para River, is about 19 miles (30 km) long and 5 miles (8 km) wide. It was named in 1837 by its surveyor for a district of Andalusia, Spain, and was settled by Prussians and Silesians in 1838. It has an excellent climate with reliable winter rains and dry, sunny summers, and its subsoil is suited to viticulture. From its grapes are produced a substantial proportion of Australia's light table wines, and the valley holds a wine festival in odd-numbered years. Supplementary farming yields honey, olive oil, fruits, and citrus juices. The valley's principal towns are Tanunda, Nuriootpa, and Angaston. A second, smaller wine region is in the nearby Barossa Hills.

barotitis: *see* ear squeeze.

barotrauma, any of several disorders arising from changes in pressure upon the body. Man is adapted to live at an atmospheric pressure of 760 millimetres (the pressure at sea level). When he ventures under water or into the upper atmospheres of space, the surrounding pressure varies from that of his usual environment. Most body tissue is either solid or liquid and remains virtually unaffected by pressure changes; in certain cavities of the body, however, such as the ears, sinuses, lungs, and intestines, there are air pockets that either expand or contract in response to changes in pressure. Several complications arising from changes in pressure are commonly known as squeezes: ear squeeze; thoracic squeeze; intestinal squeeze (*qq.v.*). *See also* decompression sickness; nitrogen narcosis.

Barotse (people): *see* Lozi.

barouche (carriage): *see* calash.

Barozio, Giacomo, Barozio also spelled BAROZZI: *see* Vignola, Giacomo da.

barquentine (ship): *see* barkentine.

Barquisimeto, city, capital of Lara *estado* ("state"), northwestern Venezuela. Situated on a wide terrace of the Turbio River 1,856 feet (566 m) above sea level, Barquisimeto is swept by the drying trade winds but has a warm climate (mean average temperature 75° F [24° C]). One of Venezuela's oldest cities, it was founded in 1552 by the Spanish interim governor Juan de Villegas, who originally named the city Nueva Segovia, after his home in Spain. Shortly after the city's founding, gold was discovered nearby at San Felipe and Los Teques; these mines were first worked by black slaves, who revolted and were suppressed by Diego de Losada y Quiroga when they threatened Nueva Segovia sometime prior to 1569. The local Jirajira Indians also revolted at about this time but were not defeated until 1628. The city was attacked in 1561 by the pirate Lope de Aguirre, but the attack failed when Aguirre's men accepted royal pardons, abandoning him and his daughter,

both of whom died in the aftermath. Aguirre's name survives in the local Tirano Aguirre, an ignis fatuus, or ephemeral light seen at night in the savanna surrounding the city. The city was almost destroyed by an earthquake in 1812 and was further damaged in the war of independence and, later, by the civil wars of the 19th century.

Barquisimeto's rise among Venezuelan cities was because of its strategic position as the hub of transport and commerce between the central and western parts of Venezuela. It also serves as the centre of a large agricultural area that produces sisal, cacao, cattle, sugarcane, and coffee, as well as subsistence crops. In the 1960s it gained several industries, manufacturing rope and twine, food products, cement, and other items. In the centre of the city's broad streets and tall buildings stands a 230-foot (70-metre) tower built in 1952 to commemorate the city's 400th anniversary. The "Lisandro Alvarado" Central-Western University attained university status in 1968. Pop. (1990) 625,450.

Barra, Gaelic BARRAIGH, Atlantic island of the Outer Hebrides group, Western Isles council area, historic county of Inverness-shire, Scotland, about 5 miles (8 km) southwest of the neighbouring island of South Uist. Formed of gneiss, it is about 10 miles (16 km) long and, with its neighbouring islets, covers about 35 square miles (90 square km). It reaches an elevation of 1,260 feet (384 metres) at Heaval. Castlebay, on the southeastern coast, is the chief settlement, with a pier and steamer connections with Mallaig and Oban. A road 14 miles long runs around the island. A lighthouse crowns the rock of Barra Head, which at 630 feet (192 m) is the highest point on Berneray, the southernmost islet. There are prehistoric stone circles, Viking duns (castles), and the medieval Kisimul Castle, stronghold of the Macneils, a Scottish clan. Gaelic is still spoken by the island's predominantly Roman Catholic population. Considerable emigration has occurred with the decline of herring fishing. Tourism is economically important today. Pop. (1991) 1,244.

Barra do Pirai, city, western Rio de Janeiro *estado* ("state"), eastern Brazil. It lies at the confluence of the Pirai and Paraíba do Sul rivers, 20 miles (32 km) east of Volta Redonda. Its varied industries include textile mills and metallurgical, chemical, and food-processing plants. Situated near the Rio de Janeiro-São Paulo axis, Barra do Pirai is easily accessible by train or automobile. Pop. (2000 prelim.) 84,796.

Barra Mansa, city, western Rio de Janeiro *estado* ("state"), eastern Brazil. It lies along the Paraíba do Sul River, at an elevation of 1,234 feet (376 m) above sea level, just southwest of Volta Redonda. The largest of the city's varied industries is the Nestlé food and chocolate complex. Situated on the Rio de Janeiro-São Paulo axis, Barra Mansa is easily accessible by railroad and highway. Pop. (2000 prelim.) 164,963.

Barracas al Sur (Argentina): *see* Avellaneda.

Barracco Museum of Antique Sculpture, Italian MUSEO BARRACCO DI SCULTURA ANTICA, in Rome, museum devoted to ancient sculpture and comprising the collection formed by Giovanni Barracco (1829-1914). The collection was given to Rome in 1902. There are fine examples of Egyptian, Assyrian, and Phoenician art, including a bust from Roman Egypt of a priest wearing a diadem, formerly thought to be a portrait of Julius Caesar. Greek sculpture of the classical period is well-represented. Among the finest examples is a head of Marsyas, a replica of the

head of the famous statue by Myron. A head of Apollo Kitharoidos, after Praxiteles, is the best extant replica of that work. In addition there are excellent and valuable examples of Hellenistic sculpture and fine Roman portrait busts.

Barrackpore, also spelled BARRACKPUR, also called CHANAK, town, southeastern West Bengal state, northeastern India. It lies just east of the Hooghly River and is part of the Calcutta urban agglomeration, lying 15 miles (24 km) north of Calcutta. The name Barrackpore probably is derived from there having been troops stationed there—in barracks—since 1772. Barrackpore Park contains the former suburban residence of the viceroy of India.

The town was constituted a municipality in 1869, but its area was curtailed by the separation of Titāgarh (*q.v.*) municipality in 1895 and Pānihāti (*q.v.*) municipality in 1900. Major industries include jute and rice milling, sawmilling, and hosiery manufacture. Barrackpore has a racecourse, an airfield for freight traffic, a government agricultural institute, and several colleges affiliated with the University of Calcutta. Pop. (1991) 133,265.

Barrackpore Mutiny, also spelled BARRACKPUR MUTINY (Nov. 2, 1824), incident during the First Anglo-Burmese War (1824–26), generally regarded as a dress rehearsal for the Indian Mutiny of 1857 because of its similar combination of Indian grievances against the British, caste feeling, and the ineptitude of its handling. During the war, Indian forces of the 47th regiment were ordered to march to Chittagong by land because caste taboo forbade high-caste men to go by sea. Under the regulations they had to transport their personal effects, also subject to caste rules, but had no bullocks available because the army had already engaged the supply. The men's complaints and petitions were disregarded, and their grievances increased when camp followers were offered higher pay than the troops themselves. When the regiment refused to march, it was surrounded on the parade ground, bombarded by the artillery, and forced to flee under fire.

The regiment's name was erased from the army list, the ringleaders were hanged, and others were imprisoned. The incident nearly led to the recall of the British governor-general, Lord Amherst, and the military authorities were criticized for their rigidity and vindictive harshness.

barracuda, any of about 20 species of predatory fishes of the family Sphyrnaidae (order Perciformes). Barracudas are found in all warm and tropical regions; some also range into more temperate areas. Swift and powerful, they are slender in form, with small scales, two well-separated dorsal fins, a jutting lower jaw, and a large mouth with many large, sharp teeth. Size varies from rather small to 1.2–1.8 m (4–6 feet) in the great barracuda (*Sphyrna barracuda*) of the Atlantic, Caribbean, and western Pacific.

Barracudas are primarily fish eaters, preying on such smaller fishes as mullets, anchovies,

Barracuda (*Sphyrna*)

C Leroy French—Tom Stack & Associates

and grunts. They are esteemed as sport fishes, and the smaller forms are also valued as food. In certain seas, however, they may become impregnated with a toxic substance that produces a form of poisoning known as ciguatera. Barracudas are often regarded as bold and inquisitive, and large ones are regarded as fearsome fishes, potentially dangerous to humans. The threat, though probably exaggerated, is real; the great barracuda is known to have been involved in attacks on swimmers.

barracudina, any of about 50 species of marine fishes of the family Paralepididae, found almost worldwide in deep waters. Barracudinas are long-bodied, slender fishes with large eyes, pointed snouts, and large mouths provided with both small and larger, fanglike teeth. Barracudinas grow to about 60 cm (2 feet) long. They are not often seen but are sometimes attracted to bright lights at the surface. It is thought that they may be an important food for larger fishes, such as tunas and swordfish.

Barrancabermeja, city, Santander departamento, north-central Colombia, on the Magdalena River. In 1536 a Spanish conquistador, Gonzalo Jiménez de Quezada, discovered the wooden-stockaded Indian settlement of La Tora. The Spaniards eventually renamed it Barrancas-Bermejas (Reddish Cliffs) after the

Oil refinery at Barrancabermeja on the Magdalena River, Colombia

Loren McIntyre—AVP

nearby river bluffs. Barrancabermeja became a ranching town and a marketing centre for beef. The Mares Oil Concession (1921) and the development of the petroleum industry gave impetus to its growth. Networks of highways, railroads (including the Atlantic Railway linking Santa Marta and Bogotá), and oil pipelines were built in the locality, and a large oil refinery and an international airport were constructed in the city. The Cathedral of the Sacred Heart of Jesus is a notable landmark. Pop. (1999 est.) 178,020.

Barranco, city and *distrito* ("district"), in the southern portion of the Lima-Callao metropolitan area, Peru. It lies along the Pacific coast at an elevation of 213 feet (65 m) above sea level. Founded as a village beach resort in 1874, it became a town in 1893 and a city in 1901. In 1881, during the War of the Pacific, it was sacked and burned by Chilean forces. It is a middle- and high-income residential district, with public beaches, a large municipal park, and a zoo. The Pedro de Osma, a museum containing an extensive collection of colonial artifacts, and the national aviation school are in Barranco. Pop. (1990 est.) 53,500.

Barrande, Joachim (b. Aug. 11, 1799, Saugues, Fr.—d. Oct. 5, 1883, Frohsdorf, Austria), geologist and paleontologist whose studies of the fossil strata of Bohemia revealed the abundance and rich variety of life in the Early Paleozoic era (the Paleozoic lasted from 570 million to 245 million years ago).

The tutor of the grandson of Charles X, the king of France, he joined the royal family in exile in 1830. They settled temporarily in Prague in 1832, and Barrande remained there. While working as an engineer, he became in-

terested in the fossils of the region, and, when he realized the striking similarity between the strata of Britain, as described by the noted British geologist Sir Roderick I. Murchison, and the strata in Bohemia, he began an intensive geological study. His primary work, *Système silurien du centre de la Bohême* (1852–94; "Silurian System of Central Bohemia"), complete with excellent drawings, is still used as a reference work. In it he identified and analyzed more than 4,000 new fossil species.

Barranquilla, capital of Atlántico departamento, northwestern Colombia. It is situated in the Caribbean lowlands, 15 miles (24 km) upstream from the mouth of the Magdalena

El Prado suburb of Barranquilla, Colom.

Carl Frank

River, and is Colombia's largest port along the Caribbean Sea. Founded in 1629, it remained unimportant until the construction of a railroad to satellite ports on Sabanilla Bay and the clearing of sandbars from the Magdalena River's mouth in the 1930s. Since World War II, the relative decline in traffic on the river and the growth of road transport have instead favoured the development of the Pacific port of Buenaventura. Barranquilla, however, continues to handle much coffee and petroleum from the interior and cotton from the surrounding region. It is also the terminus of natural-gas pipelines from fields in northern Colombia. Textiles, beverages, cement, shoes, clothing, cardboard, and chemicals are among its industrial products. Barranquilla houses Atlántico University (1941) and the University of the North (1966). The city is accessible by highway, possesses an international jet airport, and is a major gateway to tourism on the Caribbean coast. Pop. (1999 est.) 1,223,260.

Barras, Paul-François-Jean-Nicolas, vicomte de (viscount of) (b. June 30, 1755, Fox-Amphoux, Fr.—d. Jan. 29, 1829, Chaillet), one of the most powerful members of the Directory during the French Revolution.

A Provençal nobleman, Barras volunteered as gentleman cadet in the regiment of Languedoc at the age of 16 and, from 1776 to 1783, served in India. A period of unemployment in Paris left Barras disenchanted with the royal regime, and he welcomed the outbreak of the Revolution in 1789. He entered the Club of the Jacobins almost immediately after it was founded and returned to the *département* of Var in 1791 to make himself eligible for election to the Legislative Assembly. Although his fierce electoral campaign failed to gain him election to the Assembly itself, he was made an elector from Var.

In September 1792, Barras returned to Paris, where he was elected deputy to the National Convention. As commissar in the French army of Italy, his first mission was to liberate Var and Nice from royalist forces and to organize the new *département* of Alpes-Maritimes. After voting for the king's death, he was sent to the Alps to conquer anti-Jacobin forces at Toulon, where his successful campaign gained him new prominence in the Convention and where he first met Napoleon Bonaparte.

During the Reign of Terror of 1794, Barras refused to align himself with any particular group. Nevertheless, he shrewdly reasserted himself in the coup of 9 Thermidor (July 27, 1794), acting as one of the three key figures in the overthrow of the Jacobin leader Maximilien Robespierre, and he emerged as the commander of the Army of the Interior and the police. His fame and power quickly increasing, he held a number of high-level positions in the Convention and Committee of Public Safety between the summer of 1794 and the autumn of 1795, by which time he had helped crush a revolt of the Parisian populace, aggravated antiroyalist attacks in the Convention, and begun an affair with Joséphine de Beauharnais, Napoleon's future wife.

Renamed general of the Army of the Interior on 13 Vendémiaire (Oct. 5, 1795), he and Napoleon defended the regime against an attempted royalist insurrection and brought about the establishment of the Directory. By engineering the elections, Barras made himself one of the new *directeurs*, emerging as the most popular of the five. In 1796 he became actively involved with Le Cercle Constitutionnel, a group of antiroyalist liberals that included Talleyrand, Joseph Fouché, Benjamin Constant, and Madame de Staël, who supported the less republican and more authoritarian structure of the Directory.

The coup of 18 Fructidor (Sept. 4, 1797), a purge of royalists in the Assembly, brought Barras to the apex of his power, but he fell from power in Napoleon's coup of 18 Brumaire (Nov. 9, 1799). He was placed under the constant surveillance of Fouché's spy network, and Napoleon's suspicion of his conspiratorial activities brought about his exile to Brussels between 1801 and 1805, when he was permitted to return to southern France. When Napoleon learned of his secret meetings there with the former Spanish king Charles IV, he sent him to Rome in 1813. Barras may have contacted Louis XVIII even before 18 Brumaire; in any event, after the Second Restoration of the Bourbon monarchy (1815) the king permitted him to live in peace at his estate at Chaillot. His *Mémoires* were published in four volumes in 1895–96.

BIBLIOGRAPHY. A. Mathiez, *Le Directoire* (1934); J. Vivent, *Barras, Le "Roi" de la République* (1938).

Barrault, Jean-Louis (b. Sept. 8, 1910, Le Vésinet, France—d. Jan. 22, 1994, Paris), French actor, director, and producer whose work with both avant-garde and classic plays helped revive French theatre after World War II.

Barrault, a student of Charles Dullin, first appeared on the stage as a servant in Dullin's production of *Volpone* (1931). Barrault also studied mime with Étienne Decroux; indeed, Barrault's first independent production, an adaptation of William Faulkner's novel *As I Lay Dying* (1935), was a mime play. His other early productions included Miguel de Cervantes' *Numancia* (1937) and *Faim* (1939), based on the novel *Hunger* by Knut Hamsen. In 1940 he joined the Comédie-Française at the instigation of Jacques Copeau, and it was there that he met his wife and working associate, the actress Madeleine Renaud. During the years that he was associated with the Comédie, Barrault directed and acted in numerous works, including *Phèdre*, *Antony and Cleopatra*, and Paul Claudel's *Le Soulier de satin* ("The Satin Slipper").

In 1946 he and his wife formed their own company at the Théâtre Marigny under the name Compagnie M. Renaud-J.L. Barrault. They opened with *Hamlet* in a translation by André Gide, followed by *Les Fausses confidences* ("False Confessions") by Pierre Marivaux and Armand Salacrou's *Les Nuits de la colère* ("Nights of Anger"). The combination of French and foreign classics with modern

plays became the hallmark of the company's great success. Barrault brought Claudel's plays to the attention of the French public through various productions in the 1940s and '50s. His company's other productions included Georges Feydeau's farces as well as such modern plays as Eugene Ionesco's *Rhinocéros* (1960), Christopher Fry's *A Sleep of Prisoners* (1955), and works by Jean Anouilh, Jean-Paul Sartre, and Henry de Montherlant. Barrault continued to produce, direct, and act lead roles throughout this period.

From 1959 to 1968 Barrault was director of the Odéon, which was renamed the Théâtre de France, and there he produced new plays by Samuel Beckett and François Billeloux. He was also director of the Théâtre des Nations (1965–67, 1972–74) and founder-director of the Théâtre D'Orsay (1974).

Barrault's extensive film acting began with *Les Beaux Jours* in 1936 and includes, among many others, *Drôle de drame* (1937), *La Symphonie Fantastique* (1942), and *La Ronde* (1950). His best-known film role was as the pantomimist Deburau in Marcel Carné's *Les Enfants du Paradis* (1945). Among Barrault's publications are *Réflexions sur le théâtre* (1949; *Reflections on the Theatre*), *Nouvelles réflexions sur le théâtre* (1959; *The Theatre of Jean-Louis Barrault*), and *Souvenirs pour demain* (1972; *Memories for Tomorrow*). Barrault was named an officer of the Legion of Honour.

Barre, city, Washington county, central Vermont, U.S. It lies just south of Montpelier, the state capital. The area, settled about 1788, was organized as a town (township) in 1793 under the name of Wildersburgh but was soon renamed for Barre, Mass. The city was set off and incorporated in 1894. It is a centre of the nation's granite quarrying, which began there after the War of 1812 and attracted Italian, Scottish, and Scandinavian stoneworkers. In 1975, a new operation, the Adams Quarry, opened at Barre. The manufacture of electrical equipment is also important. The surrounding

Granite quarry, Barre, Vt.

Barre town (township) includes the villages of East Barre, South Barre, Graniteville (site of Rock of Ages Granite Quarry), and Websterville. Goddard College (1938) is 5 miles (8 km) north. East Barre Dam (1935) is part of the Winooski Flood Control Project. Groton State Forest is nearby. Pop. (1990) 9,482.

barre, in ballet, the horizontal handrail, usually wooden, that is fixed to the walls of a ballet studio approximately 3.5 feet (1 m) from the floor. It is used by dancers as an aid to

Barre being used by students of the Moscow Academic School of Choreography of the Bolshoi Theatre

Tass—Sovfoto

confidence and as a point of support during the preliminary exercises ("barre work") that have been an essential part of ballet training since the development of classical ballet in the 19th century.

barrel, large, bulging cylindrical container of sturdy construction traditionally made from wooden staves and wooden or metal hoops. The term is also a unit of volume measure, specifically 31 gallons of a fermented or distilled beverage, or 42 gallons of a petroleum product. According to the 1st-century-AD Roman historian Pliny the Elder, the ancient craft of barrel making, also called cooperage, was invented by the inhabitants of the Alpine valleys.

Slack barrels, made to hold dry products, may be made of pine or softwood and do not require precise workmanship. Smaller versions, usually called kegs, long were used to contain heavy bulk products such as nails. Tight barrels, made to hold liquids, must be constructed carefully of high-grade woods, such as white oak, with bungholes for filling and emptying.

Wood for barrel staves and headings is usually air-dried for at least a year, then kiln-dried for 10 to 20 days before being cut and planed to the needed size and finish. A crucial operation is jointing of the edges of the staves and giving them the proper bilge (middle bulge) so that the joints will be tight and the circumference uniform. The bulge gives the barrel added resistance to internal pressure.

The most complex part of the operation is called raising the barrel. Staves are set vertically into a head truss ring, and a temporary hoop is placed over the other end. In this arrangement, the staves are passed through a steam tunnel to soften them for drawing into final shape and then dried again. Whiskey barrels are charred on the inside at this point, so that they will develop flavour in the whiskey

as it ages. Beer, formerly stored and shipped in wooden barrels, now is placed in one-piece metal barrels. A machine called a crozer trims the ends of the staves and cuts the croze, the groove near the end of the stave where the head pieces fit. The temporary end rings are pulled off, the head pieces fitted, and permanent head hoops put in place. The temporary bilge hoops are removed, and the rest of the permanent hoops are put on.

Tight barrels have been superseded for the most part by metal drums and bulk-tank transportation, and slack barrels by paper-shipping sacks, corrugated paperboard cartons, and fibreboard drums.

barrel, unit of both liquid and dry measure in the British Imperial and U.S. Customary systems, ranging from 31 to 42 gallons for liquids and fixed at 7,056 cubic inches (105 dry quarts, or 115.65 litres) for most fruits, vegetables, and other dry commodities. The cranberry barrel, however, measures 5,826 cubic inches. In liquid measure, the wine barrel of 126 quarts (31.5 gallons, or 119.24 litres) and the ale and beer barrel of 144 quarts (36 gallons, or 136.27 litres) probably were defined by the traditional size of the actual wooden barrels used in these trades. In the United States a 40-gallon barrel for proof spirits has been legally recognized, and federal taxes on fermented liquors are calculated on a barrel of 31 gallons. A petroleum barrel of 42 gallons may have become standard in the American Southwest because casks of this capacity were readily available. Dry-weight barrels include the barrel of 200 pounds for fish, beef, and pork and that of 376 pounds for cement, among others.

barrel cactus, name for a group of more or less barrel-shaped cacti, family Cactaceae, native to North and South America. It is most often used for two large-stemmed North

Barrel cactus (*Echinocactus grusonii*)
Carlo Bevilacqua—SCALA from Art Resource/EB Inc

American genera, *Ferocactus* and *Echinocactus*. Small barrel cacti include the genera *Sclerocactus*, *Neolloydia*, *Echinofossulocactus*, and *Thelocactus*.

Echinocactus usually grows to about 60 centimetres (2 feet) long and about 30 cm in diameter, and *Ferocactus* to about 3 metres (10 feet) long and about 60 cm in diameter. A large specimen may weigh several hundred pounds.

The stems of barrel cacti generally have strong stiff spines and prominent ribs. They endure the driest environments. Flowers, yellow to orange and purplish and sometimes fragrant, are up to 8 cm across. Long narrow fruit distinguishes *Echinocactus* from *Ferocac-*

Barrel cactus (*Sclerocactus parviflorus*)
Dorothea W Woodruff—EB Inc

tus. *Echinocactus* contains about 16 species, *Ferocactus* 25.

Many authorities include *Astrophytum* and *Homalocephala* with *Echinocactus*, and *Hamatocactus* with *Ferocactus*. The eight or nine species of *Sclerocactus* have at least one hooked central spine. Their flowers are mainly pink, yellow, and cream. The Mojave Desert giant of the genus, *S. polyancistrus*, a cylindroid cactus up to 40 cm in height and 13 cm in diameter, has showy red and white spines and large flowers. Almost as large are the cacti of the commonest and least specialized group, the *S. parviflorus* complex of the Colorado Plateau. The remaining six species of small cacti grow in widely scattered colonies.

Neolloydia, with about 20 species, is native to the southwestern U.S. and south far into Mexico. Spiny and globose to cylindroid, *Neolloydia* species reach 40 cm in height and 12 cm in diameter. The genus is related to *Sclerocactus*, *Thelocactus*, and *Gymnocactus*.

Echinofossulocactus (formerly *Stenocactus*) comprises about 30 species native to Mexico. Plants are more or less globose, rarely exceeding 12 cm in diameter. The genus is distinguished primarily by its numerous wavy ribs, in one species numbering more than 100, giving the convoluted aspect of a "brain"; hence the common name brain cactus. One species, *E. coptonogonus*, otherwise fitting the genus, does not have this characteristic.

Thelocactus is a genus of a few to 30 species (depending on the authority) of small to medium-sized, more or less spiny plants with tubercles (protuberances) distinct or coalescent into ribs. *T. hexaedrophorus*, with large blue tubercles, is an unusual pot plant. Some species have showy white, pink, or purple flowers and colourful spines.

barrel organ, musical instrument in which a pinned barrel turned by a handle raises levers,

Italian barrel organ, early 19th century; in the Metropolitan Museum of Art, New York City
By courtesy of the Metropolitan Museum of Art, New York City, the Crosby Brown Collection of Musical Instruments, 1889

admitting wind to one or more ranks of organ pipes; the handle simultaneously actuates the bellows. Ten or more tunes can be set on one barrel.

Barrel organs are valuable because they preserve old styles of musical ornamentation. They reached a peak of popularity in the late 18th and early 19th centuries; some played the psalms in village churches until well into the 20th century. They are sometimes confused with other handle-operated street instruments, including the barrel piano and the hurdy-gurdy.

barrel piano, also called STREET PIANO, stringed musical instrument (chordophone) in which a simple pianoforte action is worked by a pinned barrel turned with a crank, rather than by a keyboard mechanism. It is associated primarily with street musicians and is believed to have been developed in London

European barrel piano, early 19th century; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York City, the Crosby Brown Collection of Musical Instruments, 1889

early in the 19th century. The centre of its manufacture later moved to Italy.

It is sometimes confused with two older street instruments, the barrel organ and the hurdy-gurdy, as these are also operated by a crank. It is also wrongly referred to as a hand, or handle, organ.

barrel vault, ceiling or roof consisting of a series of semicylindrical arches. *See* vault.

Barrell, Joseph (b. Dec. 15, 1869, New Providence, N.J., U.S.—d. May 4, 1919, New Haven, Conn.), geologist who proposed that sedimentary rocks were produced by the action of rivers, winds, and ice, as well as by marine sedimentation.

Barrell worked with the United States Geological Survey in 1901 in Montana, where he conducted studies of the Marysville mining district, near Helena. Concluding that a new theory for the granite batholiths (great masses of igneous rock) of that area was necessary, he presented his ideas in *Geology of the Marysville Mining District, Montana* (1907). In this classic work on geology he proposed the then new concept that molten magma from the Earth's interior interacts with the crust to form fissures and create new surface features.

Before the publication of Barrell's papers on sedimentation, it was generally believed that almost all sedimentary strata were produced by oceans. A close study of the Triassic deposits (190,000,000 to 225,000,000 years old) of New Jersey and the Western deserts convinced Barrell that at least one-fifth of the land was covered by other types of sediments. In addition, he challenged the idea that the depth

of sedimentary layers is directly related to the time necessary to produce them. In a pioneering work, "Strength of the Earth's Crust," published in the *Journal of Geology* (vol. 22 and 23, 1914-15), Barrell presented his own views on isostasy (the equilibrium forces involved in balancing mountains and basins in the Earth's crust) and tried to explain many geologic phenomena by the interaction of two hypothetical crust layers.

Barremian Stage, the fourth of six main divisions (in ascending order) in the Lower Cretaceous Series, representing all those rocks deposited worldwide during the Barremian Age (124 to 119 million years ago).

The classic type district for rocks of this age is located around Angles, in Alpes-de-Hautes-Provence department in southeastern France. In northern Europe the Barremian Stage is represented by portions of the thick Hils Clay, while in England it includes the upper portions of the Wealden sandstones and clays. The base of the stage is generally taken at a point containing the fossil ammonite cephalopod *Pseudotoxurmannia*. The biozones of the calcareous nannofossil *Nannoconus steinmanni* and of the planktonic foraminiferan *Hedbergella sigali* are also considered diagnostic for rocks of this age. Rocks of the Barremian Stage overlie those of the Hauterivian Stage and underlie rocks of the Aptian Stage.

Barren Grounds, also called **BARREN LANDS**, sub-Arctic prairie (tundra) region of northern mainland Canada (Northwest Territories), extending westward from Hudson Bay to the Great Slave and Great Bear lakes, northward to the Arctic Ocean, and southward to latitude 59° N along the Hudson Bay coastal plain. Its surface is a low (less than 1,000

Barren Grounds tundra near Wager Bay, Northwest Territories, Canada

© David Middleton/NHPA

feet [300 m]), glaciated, treeless plain that is covered with grasses, mosses, and lichens, interspersed with granitic outcrops, and dotted with innumerable lakes and streams, including the Coppermine, Back, Dubawnt, Kazan, and Thelon rivers. Everywhere the ground is permanently frozen to within a few inches of the surface, creating, in many areas, vast stretches of mosquito- and fly-infested swamp during the summer thaw. Caribou, musk-ox, fox, and bear inhabit the Barren Grounds, which is protected, in part, by Yellowknife and Thelon game sanctuaries. A few Inuit (Eskimo), living in the coastal areas, are the only human inhabitants. The Barren Grounds was first explored by the Englishman Samuel Hearne during his 1769-72 expedition.

Barrès, Maurice, in full **AUGUSTE-MAURICE BARRÈS** (b. Aug. 19, 1862, Charmes-sur-Moselle, France—d. Dec. 5, 1923, Paris), French writer and politician, influential through his individualism and fervent nationalism.

After completing his secondary studies at the Nancy lycée, Barrès went to Paris to study law but instead turned to literature. Then he embarked on a solitary project of self-analysis, through a rigorous method described in

Barrès, 1906

H. Roger-Viollet

the trilogy of novels entitled *Le Culte du moi* ("The Cult of the Ego"). This work comprises *Sous l'oeil des Barbares* (1888; "Under the Eyes of the Barbarians"), *Un Homme libre* (1889; "A Free Man"), and *Le Jardin de Bérénice* (1891; "The Garden of Bérénice").

At 27 he embarked on a tumultuous political career. He ran successfully for deputy of Nancy on a platform demanding the return to France of Alsace-Lorraine. From this patriotic stance he adopted an increasingly intransigent nationalism. This stage was minutely reported in a new trilogy of novels, *Le Roman de l'énergie nationale* ("The Novel of National Energy"), made up of *Les Déracinés* (1897; "The Uprooted"), *L'Appel au soldat* (1900; "The Call to the Soldier"), and *Leurs figures* (1902; "Their Figures"). In these works he expounded an individualism that included a deep-rooted attachment to one's native region. *Les Déracinés* tells the story of seven young provincials who leave their native Lorraine for Paris but suffer disillusionment and

failure because they have been uprooted from their native traditions. With Charles Maurras, he expounded the doctrines of the French Nationalist Party in the pages of two papers: *La Cocarde* and *Le Drapeau*. His series of novels entitled "Les Bastions de l'Est" (*Au service de l'Allemagne*, 1905 ["In the Service of Germany"]); *Colette Baudoche*, 1909) earned success as French propaganda during World War I. *La Colline inspirée* (1913; *The Sacred Hill*) is a mystical novel that urges a return to Christianity for social and political reasons.

At times, however, the artist may be found to supersede the politician in Barrès' writing. His travels in Spain, Italy, Greece, and Asia inspired the beautiful pages, free from ideology, of *Du sang, de la volupté et de la mort* (1894; "Of Blood, Pleasure, and Death") and of *Un Jardin sur l'Oronte* (1922; "A Garden on the Orontes"). He was elected to the French Academy in 1906.

Barreto, Afonso Henriques de Lima: see Lima Barreto, Afonso Henriques de.

Barreto, Francisco (b. 1520, Faro, Port.—d. July 9, 1573, Sena [now in Mozambique]), Portuguese soldier and explorer.

Barreto served in the East Indies, was gov-

ernor of Portuguese India, and was probably instrumental in exiling Luís de Camões to Macau after the poet had published criticisms of Portuguese administration in India. In 1569 Barreto was entrusted by King Sebastian of Portugal with an expedition to the empire of Mwene Matapa in southeastern Africa to assert Portuguese authority over the area, capture the gold mines of Manica, and avenge the murder of a missionary. Barreto took the Zambezi River valley route (1572); the following year the expedition was repeated, but Barreto became mortally ill and died at Sena.

Barretos, city, north-central São Paulo estado ("state"), Brazil. It lies near the Pardo River at 1,713 feet (522 m) above sea level. Known at various times as Amaral dos Barretos, Espírito Santo de Barreto, and Espírito Santo dos Barretos, the settlement was given town status and was made the seat of a municipality in 1885. The site of the state's biggest cattle market, Barretos also serves an agricultural area producing rice and other grains, *feijão* (beans), cotton, and coffee. Its industries bottle mineral water, process crops, and manufacture shoes, furniture, and other goods. A railroad line and highway connect Barretos with the city of São Paulo some 250 miles (400 km) to the southeast. The city also has an airfield. Pop. (1991 prelim.) 88,925.

Barrett, Elizabeth: see Browning, Elizabeth Barrett.

Barrett, Kate Harwood Waller, née KATHERINE HARWOOD WALLER (b. Jan. 24, 1857, Falmouth, Va., U.S.—d. Feb. 23, 1925, Alexandria, Va.), American physician who directed the rescue-home movement for unwed mothers in the United States.

Barrett became interested in the issue of prostitution while helping her husband, Robert S. Barrett, a minister whom she married in 1876. She earned an M.D. from the Women's Medical College of Georgia in 1892. The next year she opened a rescue home in Atlanta, which became affiliated with Charles Crittenton's national chain of Florence Crittenton homes for unwed mothers.

In 1897 Barrett became vice president of the Florence Crittenton Mission, which operated more than 50 homes nationwide, and from 1909 until her death she served as the organization's president. She guided the rescue-home movement away from its focus on prostitute reformation and toward a concern with the social welfare of the unwed mother, a shift that helped to make the unwed mother an acceptable subject of philanthropy.

Barrett, Lawrence (b. April 4, 1838, Paterson, N.J., U.S.—d. March 20, 1891, New York, N.Y.), one of the leading American actors of the 19th century, especially noted for his Shakespearean interpretations.

Lawrence Barrett
BBC Hulton Picture Library

He made his stage debut at age 15 in Detroit in J. Talbot Haines's *French Spy*, and on Jan. 20, 1857, he first appeared in New York City at Burton's Chambers Street Theatre as Sir Thomas Clifford in James Sheridan Knowles's *Hunchback*. He played various leading roles in New York City and Boston until 1861, when the Civil War broke out, and he then served as a captain in the 28th Massachusetts Regiment until Aug. 8, 1862. After the war he acted in several cities, achieving national prominence. With John McCullough, he managed the California Theatre in San Francisco (1867–70). His many roles include Hamlet, Lear, Macbeth, Shylock, Richard III, and Cardinal Wolsey, as well as Lanciotto in George Henry Boker's *Francesca da Rimini* (probably his greatest popular success) and Harebell in William Wills's *Man o' Airlie*. He played Othello to Edwin Booth's Iago, and Cassius to Booth's Brutus. He acted in London a number of times between 1867 and 1884. Barrett also wrote a biography of Edwin Forrest in the "American Actors" series (1881) and a sketch of Booth in *Edwin Booth and His Contemporaries* (1886).

Barri, Gerald de: see Giraldu Cambrensis.

Barrie, city, seat (1837) of Simcoe county, southeastern Ontario, Canada. It lies along Kempenfelt Bay, an arm of Lake Simcoe, 55 miles (90 km) north-northwest of Toronto. In 1812 a storehouse was probably built on the site, which during the War of 1812 was the landing and starting point of the Nine-Mile-Portage (a military supply route to the upper Great Lakes). It was permanently settled in 1828 and named for Commodore Robert Barrie, commander of a naval squadron at Kingston, Ont. Allandale village to the south was annexed in 1897. Barrie is now a summer and winter resort with diversified manufacturing. Its attractions include Brookdale Zoo and Centennial Park, and immediately to the north are the Simcoe County Museum and Archives and Springwater Provincial Park. Canadian Forces Base Borden is a few miles west. Inc. town, 1851; city, 1959. Pop. (1996) city, 79,191; urban agglom. 118,695.

Barrie, Sir James (Matthew), BARONET (b. May 9, 1860, Kirriemuir, Angus, Scot.—d. June 19, 1937, London, Eng.), dramatist and novelist who is best known as the creator of Peter Pan, the boy who refused to grow up.

The son of a weaver, Barrie never recovered from the shock he received at six from a brother's death and its grievous effect on his mother, who dominated his childhood and retained that dominance thereafter. Throughout his life Barrie wished to recapture the happy years before his mother was stricken, and he retained a strong childlike quality in his adult personality.

Barrie studied at the University of Edinburgh and spent two years on the Nottingham *Jour-*

nal before settling in London as a free-lance writer in 1885. His first successful book, *Auld Licht Idylls* (1888), contained sketches of life in Kirriemuir, and the stories in *A Window in Thrums* (1889) continue to explore that setting. *The Little Minister* (1891), a highly sentimental novel in the same style, was a best-seller, and after its dramatization in 1897, Barrie wrote mostly for the theatre. His autobiographical novels *When a Man's Single* (1898) and *Sentimental Tommy* (1896) both feature a little boy in Kirriemuir ("Thrums") who weaves a cloak of romantic fiction between himself and reality and becomes a successful writer. Most of these early works are marked by quaint Scottish dialect, whimsical humour and comic clowning, pathos, and sentimentality.

Barrie's marriage in 1894 to the actress Mary Ansell was childless and apparently unconsummated. In 1897 he formed an attachment to Sylvia Llewellyn Davies, and it was to her sons, through whom he began to live again the experience of childhood, that he told his first Peter Pan stories, some of which were published in *The Little White Bird* (1902). The play *Peter Pan, the Boy Who Wouldn't Grow Up*, followed in 1904. This play added a new character to the mythology of the English-speaking world in the figure of Peter Pan, and its theme of heroic boyhood triumphant over the seedy, middle-aged pirate Captain Hook has proved to have a lasting appeal.

Barrie's idyll of reexperienced boyhood was followed by tragedy. His marriage ended in divorce in April 1910; Sylvia Davies, then a widow, died four months later; and two of her sons, to whom Barrie acted as guardian, were killed. Barrie was created a baronet in 1913 and was awarded the Order of Merit in 1922. He became president of the Society of Authors in 1928 and chancellor of the University of Edinburgh in 1930.

Most of Barrie's stage triumphs are marred by ephemeral whimsicalities, but at least six of his plays—*Quality Street* (1901), *The Admirable Crichton* (1902), *What Every Woman Knows* (1908), *The Twelve-Pound Look* (1910), *The Will* (1913), and *Dear Brutus* (1917)—are of indisputably high quality. Barrie idealized childhood but took a disenchanting view of adult life, as reflected in the gentle melancholy of these works. Sometimes he expressed his disenchantment humorously, as in *The Admirable Crichton*, in which a butler becomes the king of a desert island, with his former employers as serfs; sometimes satirically, as in *The Twelve-Pound Look*; and sometimes tragically, as in *Dear Brutus*, in which nine men and women whose lives have come to grief are given a magical second chance, only to wreck themselves again on the reefs of their own temperaments. The elaborate stage directions in Barrie's plays are sometimes more rewarding than their dialogue itself. Barrie proved himself a master of stage effects and of the delineation of character, but the sentimental and whimsical elements in his work continue to cloud his reputation.

barrier penetration (quantum mechanics): see tunneling.

barrier reef, a coral reef (*q.v.*) roughly parallel to a shore and separated from it by a lagoon or other body of water. A barrier reef is usually pierced by several channels that give access to the lagoon and the island or continent beyond it.

Barrin, Roland-Michel: see La Galissonnière, Roland-Michel Barrin, Marquis de.

Barringer Crater (Arizona): see Meteor Crater.

Barrington, town (township), Bristol county, eastern Rhode Island, U.S. The town lies on the eastern shore of Narragansett Bay just southeast of Providence and occupies two

peninsulas separated by the Barrington River. As early as 1632, Plymouth settlers had established a trading post in the area on Sowams, once the fishing and hunting grounds of Wampanoag Indians. The first European settlement was made by John Myles and his followers. In 1677 Myles's settlement, including Sowams, was incorporated as Swansea. This section, in turn, was incorporated in 1717 as the Town of Barrington (named for Viscount Barrington, an English lawyer who advocated religious freedom) by the General Court of Massachusetts Bay Colony. In 1746 Barrington was transferred to Rhode Island Colony, forming a part of the Town of Warren. In 1770 the western part of Warren was separated and incorporated as Barrington. Barrington (including the village of West Barrington) is mainly residential, with a few light industries manufacturing textiles, foods, rubber, and plastics. Pop. (2000) 16,819.

Barrington, George (b. May 14, 1755, Maynooth, County Kildare, Ire.—d. Dec. 27, 1804, Parramatta, New South Wales, Australia), Irish adventurer notorious for his activities as a pickpocket in England in the 1770s and '80s; he was allegedly the author of several histories of Australia.

Barrington's father was a silversmith named Henry Waldron. About 1771 young Waldron joined a troupe of actors, taking the name George Barrington. They introduced him to the pickpocket's art, and in 1773 he entered London society as a gentleman of wit and breeding. He picked the pockets of the rich at races, theatrical performances, and state ceremonies. After his eighth conviction (1790) for these crimes, he was deported to a prison settlement in Australia. There he reformed, obtained a pardon (1796), and eventually became superintendent of the convicts. He became insane a short time after retiring in 1800.

Although publishers used Barrington's name in advertisements for several histories—including *A Voyage to New South Wales* (1803) and *The History of New South Wales* (1802)—there is no evidence that Barrington wrote these works. In addition, he was said to have originated a well-known couplet concerning the exiled convicts:

True patriots all, for be it understood,
We left our country for our country's good.

These lines were actually written by an Englishman named Henry Carter in 1801 and included in a work ascribed to Barrington.

Barrington Island (Galapagos Islands): see Santa Fe Island.

Barrio Obrero Industrial, community of San Martín de Porres *distrito* ("district"), in the Lima-Callao metropolitan area, Peru. It lies on the north bank of the Rímac River. Among the oldest and best developed of Lima's *pueblos jóvenes* ("young towns"), Barrio Obrero Industrial is primarily a working-class residential area. It contains numerous retail and service establishments and some light industry. The private university "San Martín de Porres" (1969) is located in the district. Pop. (1996 est.) 411,000.

Barrios, Eduardo (b. Oct. 25, 1884, Valparaíso, Chile—d. Sept. 13, 1963, Santiago), Chilean writer best known for his psychological novels.

Barrios was educated in Lima and at the Chilean Military Academy, in Santiago. After working as a merchant, a rubber agent, and a prospector in several Latin-American countries, he settled in 1913 in Santiago, where he served as minister of public education and director of the National Library.

Barrios began his literary career under the influence of Zola, with a collection of naturalistic stories, *Del natural* (1907; "In the Naturalistic Style"). His later novels, which

Barrie, 1893

The Granger Collection, New York City

established his reputation, include *El niño que enloqueció de amor* (1915; "The Love-Crazed Boy"), a fictionalized diary of a boy obsessed with love for one of his mother's friends; *Un perdido* (1918; "A Down-and-Out"), the story of a young boy with a deep inferiority complex; and *El hermano asno* (1922; *Brother Asno*, 1969), an unusual episode in the life of a mentally disturbed monk who attacks a girl in order to be despised by those who consider him a living saint. Barrios' most successful work was *Gran señor y rajadiablos* (1948; "Grand Gentleman and Big Rascal"), a best-seller in which the novelist portrayed life on a typical Chilean farm.

The author's personal experiences played an important part in all these novels, as well as in his other works: *Páginas de un pobre diablo* (1923; "Pages from a Poor Devil"), a series of autobiographical sketches; *Tamarugal* (1944), a novel about life in the northern mining region of Chile; and *Los hombres del hombre* (1950; "Men Within Man"), a novelistic study in human psychology.

Barrios, Justo Rufino (b. 1835, San Lorenzo, Guatemala—d. April 2, 1885, Chalchuapa, El Salvador), president of Guatemala from 1873 who carried out liberal domestic policies by dictatorial means and persistently advocated Central American unity, to be imposed by force if diplomacy proved inadequate.

Justo Barrios, portrait by an unknown artist

By courtesy of the Library of Congress, Washington, D.C.

Trained for the law, Barrios became Guatemalan army commander and the power behind the president, Miguel García Granados, in 1871, when the Conservative Party government was overthrown. After replacing Granados in 1873, Barrios became known as "the Reformer." He subjugated the local aristocracy; expelled the Jesuits and confiscated church property; enlarged and laicized the school system; built highways, railroads, and telegraph lines; encouraged the growing of coffee as the basis of the country's agriculture; and promulgated a new constitution (1876).

Barrios intervened repeatedly in the affairs of the other Central American republics in an effort to restore the five-nation federation that had collapsed in 1838. When his political persuasion failed, he invaded neighbouring El Salvador and was killed in battle.

His nephew José María Reina Barrios was president of Guatemala from 1892 until his assassination in 1898.

barrister, one of the two types of practicing lawyers in England, the other being the solicitor. In general, barristers engage in advocacy (trial work) and solicitors in office work, but there is a considerable overlap in their functions. The solicitor, for example, may appear as an advocate in the lower courts, whereas barristers are often called upon to give opinions or to draft documents.

Only barristers may appear as advocates before the High Court; they are known collectively as the bar, and it is from their ranks that the most important judicial appointments are made. To be a barrister it is necessary to be a member of one of the four Inns of Court (*q.v.*). A prospective barrister must pass a series of examinations established for the inns by the Council of Legal Education and must satisfy certain traditional requirements such as eating a certain number of dinners at the respective inn. In addition, the inns still stress the pupillage system, whereby a student or a young barrister reads with a practicing barrister for not less than a year.

The General Council of the Bar sets standards for the bar and acts in matters of general concern to the profession. A barrister is required to accept any case for a proper professional fee, for example, regardless of his personal feelings, except when there are circumstances of conflicting interests of clients. Furthermore, if a barrister does not receive payment for his work, he may not take action in court to obtain it. Barristers cannot form partnerships with other barristers or with solicitors nor can they carry on any other profession or business. Disciplinary power used to be in the hands of the governing body of each inn, the benchers (judges of the High Court or barristers), but this power was delegated to the Senate of the four Inns of Court set up in 1966. *See also* solicitor.

Barrois, ancient county, then duchy, on the western frontier of Lorraine, a territory of the Holy Roman Empire, of which Barrois was long a fiefdom or holding before being absorbed piecemeal by France. The centre and capital was the town that later came to be known as Bar-le-Duc, in the modern French *département* of Meuse.

Because of its location between France and Germany, the dukedom was for many years of uncertain loyalty. In 951 the German emperor Otto I gave the countship of Barrois (*i.e.*, the district of Bar), at the time a fief of the duchy of Lorraine, to Frederick of Ardenne. When Frederick's great-great-grandson Renaud (Reynald) inherited the countship, he founded the House of Bar. The counts of Bar increased their wealth and became the most powerful vassals of the dukes of Lorraine, with whom, however, they carried on endless struggles, usually fighting in the French ranks, while the dukes adhered to the Germans. Count Henry III made an alliance with Edward I of England and the German king Adolf of Nassau against France. Defeated in battle with the French, Henry III was forced in 1301 to do homage to the French king Philip IV for that part of the Barrois west of the Meuse River, which was claimed as being in the *mouvance*, or feudal dependency, of France and which from then on was called the "Barrois mouvant."

In 1354 Robert of Bar took the title of duke of Bar. In 1420 René of Anjou, who had inherited the dukedom, married Isabella, heiress of the Duke of Lorraine, so that on the death of the latter (1431) the Barrois and Lorraine were united. From then on the Barrois shared the fate of Lorraine, which was annexed to the French crown in 1766 on the death of Stanislaw Leszczyński, the former king of Poland, to whom it had been granted in 1738.

Barron, Clarence W(alker) (b. July 2, 1855, Boston—d. Oct. 2, 1928, Battle Creek, Mich., U.S.), financial editor and publisher who founded *Barron's Financial Weekly*.

In 1875 he joined the staff of the *Boston Transcript*, holding positions as a reporter and as financial editor. Aware of the need for daily financial news in bulletin form, he established the Boston News Bureau in 1887, became its president, and in 1897 founded the Philadelphia News Bureau. In 1901 Barron acquired

from Charles Dow the firm of Dow, Jones & Company, which became the principal financial news agency in the United States. At the same time, Barron acquired the firm's *Wall*

Barron, portrait by David MacIntosh

Street Journal, the nation's leading financial newspaper. *Barron's Business and Financial Weekly*, which he founded in 1921, and the *Journal* both continue to be published by Dow, Jones & Company. Barron was the author of several books, including *The Federal Reserve Act* (1914), *War Finance* (1919), and *A World Remaking* (1920).

Barron River, river in northeastern Queensland, Australia, rising near Herberton in the Hugh Nelson Range of the Eastern Highlands and flowing north across the Atherton Plateau past Mareeba and then east and south through the Barron Gorge to enter the Pacific Ocean

The Barron River winding through the coastal plain of northeastern Queensland

Frederick Ayer—Photo Researchers

at Trinity Bay, just north of Cairns, after a course of 100 mi (160 km). The river, draining a basin of 835 sq mi (2,160 sq km), was named in 1870 after T.H. Barron, a chief clerk of the state police.

Fed by the Clohesy River and Mazzlin, Rocky, and Flaggy creeks, the Barron is dammed to form Tinaroo Reservoir (1958), which supplies irrigation water for a tobacco and mixed-farming area, and bisects Barron Falls National Park. The Barron Falls, 10 mi above the river's mouth, are accessible from the town of Kuranda; the series of cascades

plunges 980 feet (300 m) to the coastal plain and has been harnessed for hydroelectric power.

Barros, João de (b. c. 1496, Viseu?, Port.—d. Oct. 20, 1570, Ribeira de Litém, near Pombal), Portuguese historian and civil servant who wrote *Décadas da Ásia*, 4 vol. (1552–1615), one of the first great accounts of European overseas exploration and colonization.

João de Barros, lithograph by Luiz after a portrait by Legrane

By courtesy of the Casa de Portugal London

Barros was educated in the household of the Portuguese heir-apparent and became a good classical scholar. His chivalrous romance *Crónica do Imperador Clarimundo* (1520) induced King Manuel I of Portugal to encourage Barros in his idea of writing an epic history of the Portuguese in Asia. But first he wrote several moral, pedagogical, and grammatical works, including an elementary Portuguese primer-catechism (1539) that became the prototype of all such works.

In 1522 the succeeding king, John III, sent Barros to Guinea (in western Africa), and soon after his return he was appointed treasurer (1525–28) and then factor of the Casa da Índia e Mina (1533–67), a post corresponding to crown administrator of the Portuguese colonies in Guinea and India. It was in this period that Barros wrote *Décadas da Ásia*, an epic historical account of Portuguese discoveries and conquests in the Orient to 1538. In compiling his chronicle, Barros used his official position to consult returned soldiers, merchants, and administrators and peruse all the official correspondence, while he himself was personally involved in the dispatch and return of the annual India fleets.

He finished the first draft in 1539; the first volume was published in 1552, with subsequent volumes appearing in 1553 and 1563. The last volume, which appeared posthumously in 1615, covered the period from 1539 to the end of the century and was edited and written by Diogo do Couto. Barros' other works on geography, commerce, and navigation disappeared after his death.

Barros Arana, Diego (b. Aug. 16, 1830, Santiago, Chile—d. Nov. 4, 1907, Santiago), Chilean historian, educator, and diplomat best known for his *Historia general de Chile*, 16 vol. (1884–1902; "General History of Chile").

Barros Arana originally studied for a legal career but gave up the law to pursue his interests in history and literature. In 1859 the Chilean government exiled him for writing articles critical of the government. While in exile he visited Buenos Aires, Montevideo, and Rio de Janeiro, where he collected historical data, and he later did the same in France, England, and Spain. He was one of the first Latin-American historians to explore the rich Span-

ish archives, in which he discovered an important 16th-century poem about the Spaniards' wars against the Araucanian Indians. In 1863 Barros Arana was allowed to return to Chile, and he subsequently served as a dean of the humanities faculty at the University of Santiago and as Chilean ambassador to Argentina, Uruguay, and Brazil.

As a historian Barros Arana was more a painstaking investigator and annalist than an interpreter of historical events, though his works are somewhat coloured with ideas of Chilean nationalism. His reputation rests upon his monumental *Historia general de Chile*, one of the landmarks of 19th-century Latin-American historiography. His other important books are *Las campañas de Chiloé; 1820–1826* (1856; "The Campaigns of Chiloé"), *Historia general de la independencia de Chile* (1854; "General History of the Independence of Chile"), and *Historia de la guerra del Pacífico 1879–1880*, 2 vol. (1880–81; "History of the Pacific War").

Barrot, Odilon, in full CAMILLE-HYACINTHE-ODILON BARROT (b. July 19, 1791, Villefort, France—d. Aug. 6, 1873, Bougival), prominent liberal monarchist under the July Monarchy in France (1830–48) and a leader of the electoral reform movement of 1847.

Barrot began his career in 1814 as a barrister in the Court of Cassation. After making his name as a defender of liberals, he was elected president of the society *Aide-toi, le ciel t'aidera* ("Heaven helps those who help themselves"), an organization for promoting resistance, by legal means, against the reactionary government of the Bourbon Restoration. During the July Revolution (1830), Barrot supported the proclamation of Louis-Philippe as king of the French and was one of the three commissioners of the new government who escorted the former king, Charles X, to Cherbourg on his way into exile.

Barrot

By courtesy of the Bibliotheque Nationale, Paris

From 1830 to 1848 Barrot, as deputy from Eure, was an active member of the opposition in the Chamber of Deputies. During 1846–47 he was one of the managers of the "banquets" campaign, which attempted to pressure the government into extending the franchise.

The reforms did not come, but a republican revolution did. After the flight of Louis-Philippe in 1848, Barrot joined the moderate Republicans. He headed the first ministry called by Louis-Napoléon Bonaparte (December 1848) and also became minister of justice. Dismissed from the government in October 1849, Barrot was imprisoned briefly after the coup d'état of Dec. 2, 1851, and then retired to private life. In 1871 he became vice president of the new Council of State.

Barrow (Alaska, U.S.): see Point Barrow.

barrow, in England, ancient burial place covered with a large mound of earth. In Scotland, Ireland, and Wales the equivalent term is *cairn*. Barrows were constructed in England from Neolithic (c. 4000 bc) until late pre-Christian (c. ad 600) times. Barrows of the Neolithic Period were long and contained the

various members of a family or clan, while those of the Early Bronze Age (c. 1900 bc) were round in shape and were used to bury a single important individual, perhaps a chief or clan leader. The bodies were placed in stone or wooden vaults, over which large mounds of soil were heaped. Both types of barrows continued to be used in England until the advent of Christianity. Their sites are most common in the county of Wiltshire.

Barrow, Clyde; and Parker, Bonnie (respectively b. March 24, 1909, Telico, Texas, U.S.—d. May 23, 1934, near Gibsland, La.; b. 1911, Rowena, Texas, U.S.—d. May 23, 1934, near Gibsland, La.), small-time robber team that gained fame in the United States through their flamboyant encounters with police and their promotion by the nation's newspapers.

Clyde had been a young robber long before meeting Bonnie in January 1930. After arrest and 20 months in prison (1930–32), he teamed up with Bonnie, and they began their short 21-month career, often working with confederates, such as his brother, Buck Barrow, and Buck's wife, Blanche; Ray Hamilton; and W.D. Jones. Bonnie and Clyde, as they were popularly known, robbed gas stations, restaurants, and small-town banks (their take never exceeded \$1,500), chiefly in Texas, Oklahoma, New Mexico, and Missouri. Bonnie and Clyde at last were betrayed by a friend and bullet-riddled by police in a roadblock ambush.

Barrow, Henry (b. c. 1550, Shipdam, Norfolk, Eng.—d. April 6, 1593, London), lawyer and early Congregationalist martyr who challenged the established Anglican church by supporting the formation of separate and independent churches in England.

After leading a dissolute life as a student at the University of Cambridge, he was converted through the chance hearing of a sermon and became a strict Puritan. Becoming a friend of the Separatist John Greenwood, Barrow was persuaded by him to accept the Brownist position, named for Robert Browne, who advocated the foundation of churches separate from secular governmental authority. Greenwood and Barrow were subsequently imprisoned after refusing to recant their beliefs. During a brief period of freedom in 1592, the two joined Separatists Francis Johnson and John Penry to form their own church.

Taking its government, worship, and discipline from the New Testament, Barrow's ideal church made no distinction between clergy and laity and stressed the sovereign autonomy of each congregation. Barrow was again imprisoned, however, and in 1593 he and Greenwood were tried before a civil court under the Act of 1581 against writers of seditious books. Barrow had earlier written in prison several works defending Separatism and congregational independency, including *A True Description out of the Word of God, of the Visible Church* (1589) and *A Brief Discovery of the False Church* (1590). On March 23, 1593, Barrow and Greenwood were sentenced to die on the scaffold together.

Barrow, Isaac (b. 1630, London, Eng.—d. May 4, 1677, London), English classical scholar, theologian, and mathematician who was the teacher of Isaac Newton. He developed a method of determining tangents that closely approached the methods of calculus, and he was first to recognize that the processes of integration and differentiation in calculus are inverse operations.

Barrow's degree was granted in 1648, but his academic appointment was delayed because of political unrest during the Cromwellian period. He was ordained an Anglican minister in 1660 and became a professor of Greek at the University of Cambridge (1660–63). Two years later he was also appointed professor of geometry at Gresham College, London. Of his early works, which dealt primarily with

ancient Greek mathematics, the most notable is his translation of Euclid's *Elements: The Whole Fifteen Books* (1660), which was reissued six times in the early 18th century.

As Lucasian professor of mathematics at Cambridge (1663–69), he devoted much of his time to the preparation of three lecture series concerning optics (1669), geometry (1670), and mathematics (1683). These lectures con-

Isaac Barrow, pencil drawing by David Loggan, 1676; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

tain most of his contributions to science and mathematics. His *Lectiones Geometricae* (1670; "Geometrical Lectures") contained elements similar to the calculus later developed by Gottfried Leibniz of Germany, and it was known to both Leibniz and Newton.

The association between Newton and Barrow has often been disputed. Newton was Barrow's pupil, he did attend some of Barrow's later lectures, and he was influenced to an uncertain extent. They worked together for a short time in 1669. In that year Barrow resigned his chair in favour of Newton and thereafter devoted himself to the study of divinity. In 1670 he became chaplain to Charles II, in 1673 was appointed master of Trinity College, Cambridge, and in 1675 was chosen vice chancellor of Cambridge.

Barrow, River, Irish AN BHEARU, river rising in the Slieve Bloom mountain range in the centre of Ireland and flowing for about 120 miles (190 km) to Waterford harbour in the southeast, where it joins the Rivers Nore and Suir. From its upper mountain course in counties Laoighis and Offaly, it flows east across bogs and lowlands and then turns south into the lowland immediately east of the Castlecomer Plateau. In the last 15 miles (25 km) before the confluence with the Nore, it flows through a steep, wooded gorge, which gives way to a wider lowland near New Ross. Market towns along the river include Athy, Carlow, and Graiguenamanagh.

Barrow-in-Furness, port town and borough (district), administrative county of Cumbria, historic county of Lancashire, England. It lies on the seaward side of the Furness peninsula between the estuary of the River Duddon and Morecambe Bay. A narrow channel of the Irish Sea, now bridged, lies between the mainland and the low, elongated Isle of Walney, providing shelter for extensive shipyards. The growth of Barrow dates from the 1840s, when ironworks were established using local high-grade ore and coke brought by rail across the Pennines. Shipbuilding and repairing later developed and outstripped the steel industry in economic importance; the local ore supply is now almost exhausted. Submarines have become a noted product of the shipyards, and the borough is a centre of nuclear engineering. Area borough, 30 square miles (77 square km). Pop. (1991) town, 48,947; (1998 est.) borough, 70,400.

Barrow Island, Australian island in the Indian Ocean, 30 miles (50 km) off the northwest

coast of Western Australia and 10 miles (16 km) southwest of the Monte Bello Islands. Measuring 12 by 5 miles (19 by 8 km), it has an area of 78 square miles (202 square km). It is geologically an extension of the Carnarvon Basin on the mainland. Barrow Island is characterized by its aridity and by its grass- and bush-covered sand hills, which rise steeply to heights of 270 feet (80 m). Once a turtle fishery, the island became the site of Western Australia's first commercial oil field in 1967 and is today one of Australia's richest oil fields. Oil is extracted through fracturing of rocks, and there are no derricks, but "Christmas tree" pipe structures dot the landscape. Because of the shallowness of the surrounding sea, the oil must be carried 6 miles (10 km) offshore via a submarine pipe to a tanker-loading jetty. There are also oil deposits on Pasco Island, 4 miles (6 km) south.

Barry, Welsh Y BARRI, Bristol Channel port town, Vale of Glamorgan county, historic county of Glamorgan (Morgannwg), Wales. Barry has associations with Baruch, a 7th-century Celtic monk, and with the Normans, who built a castle there in the 11th century. But its growth from a tiny village dates from 1889, when a new dock was opened there so that Barry could compete with nearby Cardiff in exporting coal. The trade of the port, which was almost entirely confined to coal exports, declined after World War I, but it revived after 1960 to handle more diversified cargoes, including imports of bananas and oil. Barry is also a shopping and service centre and a popular seaside resort for southeastern Wales, with sandy beaches and recreational facilities. Pop. (1991) 49,887.

Barry, Sir Charles (b. May 23, 1795, London, Eng.—d. May 12, 1860, London), one of the architects of the Gothic Revival in England and chief architect of the British Houses of Parliament (1840–60).

The son of a stationer, Barry was articled to a firm of surveyors and architects until 1817, when he set out on a three-year tour of Greece, Italy, Egypt, and Palestine to study architecture. In 1820 he settled in London. One of his first works was the Church of Saint Peter at Brighton, in 1826. In 1831 he completed the Travellers' Club in Pall Mall, the first work in the style of an Italian Renaissance palace to be built in London. In the same style and on a grander scale he built in 1837 the Reform Club. He was also engaged on numerous private mansions in London, the finest being Bridgewater House (1847). In Birmingham one of his best works, King Edward's School, was built in the Perpendicular Gothic style between 1833 and 1836. For Manchester he designed the Royal Institution of Fine Arts (1824) and the Athenaeum (1836), and for Halifax the town hall. He was engaged for some years in reconstructing the Treasury buildings, Whitehall.

In 1835 a design competition was held for a new Houses of Parliament building at Westminster to replace the one destroyed by fire in 1834. Barry won the contest in 1836, and the project occupied him for the rest of his life. With the help of Augustus W.N. Pugin, Barry designed a building ornamented in the Gothic Revival style and featuring two asymmetrical placed towers. The Houses of Parliament (1840–67) is Barry's masterpiece.

Barry was elected an associate of the Royal Academy in 1840 and a royal academician in the following year and received many foreign honours. He was knighted in 1852 and, on his death, was buried in Westminster Abbey.

His son, Edward Middleton Barry (1830–80), also a noted architect, completed the work on the Houses of Parliament.

Barry, James (b. Oct. 11, 1741, Cork, County Cork, Ire.—d. Feb. 22, 1806, London, Eng.), Irish-born artist whose major work,

"The Progress of Human Culture," is a series of six monumental paintings of historical and allegorical subjects done for the Great Room of the Royal Society of Arts, London.

Largely a self-taught artist, Barry in 1763 attracted the patronage of his Irish compatriot Edmund Burke, who funded Barry's stay in Italy from about 1766 to 1771 to study the Old Masters. Barry then returned to England and rose rapidly in his profession, becoming a member of the Royal Academy in 1773 and obtaining the commission to decorate the Royal Society rooms in 1777. The latter project occupied him until 1783. Barry was professor of painting at the Royal Academy from 1782 to 1799, but he died in poverty.

Barry was an exponent of the "grand style" of Sir Joshua Reynolds; hence, he drew the subject matter for his ambitious figurative compositions from classical antiquity and from literary works. Stylistically, however, his linearity and undulating forms brought him closer to the work of the leaders of the English Neoclassical style, the sculptor John Flaxman and the poet-painter William Blake.

Barry, (Marie-) Jeanne Bécu, comtesse du (countess of) (b. Aug. 19, 1743, Vaucouleurs, Fr.—d. Dec. 8, 1793, Paris), last of the mistresses of the French king Louis XV (reigned 1715–74). Although she exercised little political influence at the French court, her unpopularity contributed to the decline of the prestige of the crown in the early 1770s.

She was born Marie-Jeanne Bécu, the illegitimate daughter of lower-class parents. After a convent education, she was a shop assistant, under the name Jeanne Vaubernier, in a fashion house in Paris. While there she became the mistress of Jean du Barry, a Gascon nobleman who had made a fortune as a war contractor. He introduced her into Parisian high society, and her beauty captivated a succession of nobly born lovers before she attracted Louis XV's attention in 1768. She could not qualify as official royal mistress (*maîtresse en titre*), a position vacant since the death of Madame de Pompadour in 1764, unless she was married to a noble. Hence, du Barry arranged a nominal marriage between Jeanne and his brother, Guillaume du Barry; in April 1769 she joined Louis XV's court.

The comtesse immediately joined the faction that brought about the downfall of Louis XV's powerful minister of foreign affairs, the Duke de Choiseul, in December 1770; and she then supported the drastic judicial reforms instituted by her friend the chancellor René-Nicolas de Maupeou, in 1771. She spent much of her time on the estates that Louis had given her near Louveciennes, where she earned a reputation as a generous patron of the arts. On the death of Louis XV (May 1774) and the accession of Louis XVI, Madame du Barry was banished to a nunnery; from 1776 until the outbreak of the Revolution she lived on her estates with the Duke de Brissac. In 1792 she made several trips to London, probably to give financial aid to French émigrés. Condemned as a counterrevolutionary by the Revolutionary Tribunal of Paris in December 1793, she was guillotined.

Barry, John (b. 1745, County Wexford, Ire.—d. Sept. 13, 1803, Philadelphia, Pa., U.S.), American naval officer who won significant maritime victories during the U.S. War of Independence (1775–83). Because he trained so many young officers who later became celebrated in the nation's history, he was often called the "Father of the Navy."

A merchant shipmaster out of Philadelphia at the age of 21, Barry outfitted the first Continental fleet at the outbreak of the Revolution. Commissioned captain of the brig "Lexington" in 1776, he early distinguished himself by

capturing the British tender "Edward" after a short engagement. He fought with distinction in the campaign around Trenton, N.J. (1776), and was then commissioned captain of the frigate "Effingham," which he was forced to scuttle to avoid capture by the British.

John Barry, detail of an oil painting by Gilbert Stuart, c. 1801

By courtesy of the Oak Ridge Collection

In the winter of 1777-78 Barry commanded a spectacular boat foray that ran the British batteries at Philadelphia and raided enemy shipping in the Delaware River and Bay. Next commanding the frigate "Raleigh" out of Boston, he fought a vigorous but futile battle against superior enemy forces but managed to save most of his crew from capture. Commanding the frigate "Alliance" in 1780, he was assigned to convey Col. John Laurens on a diplomatic mission to France. En route he took several prizes and in returning engaged in a notable battle with two British sloops of war, eventually subduing them.

On the final cruise of the "Alliance" (beginning in 1782), Barry ranged the shipping lanes from Bermuda to Cape Sable and captured four British ships. He fought the last battle of the war (March 1783) in the Straits of Florida, where he beat off three British frigates seeking to intercept him.

After the war Barry was recalled to active service as senior captain of the new U.S. Navy. In the quasi-war with France (1798-1800), he was twice in command of all U.S. ships in the West Indies. By the end of his career he was senior officer of the navy.

A reliable biography is William Bell Clark's *Gallant John Barry* (1938).

Barry, Philip (b. June 18, 1896, Rochester, N.Y., U.S.—d. Dec. 3, 1949, New York City), U.S. dramatist best known for his comedies of life and manners among the socially privileged.

Barry was educated at Yale and in 1919 entered George Pierce Baker's 47 Workshop at Harvard. His *A Punch for Judy* was produced by the workshop in 1920. *You and I*, also written while Barry was a student, played 170 performances on Broadway in 1923. Over the next 20 years a succession of plays in-

Philip Barry

By courtesy of the Library of Congress, Washington, D.C.

cluded such comedies as *Paris Bound* (1927), *Holiday* (1928), *The Animal Kingdom* (1932), and *The Philadelphia Story* (1939). They are characterized by witty and graceful dialogue and humorous contrasts of character or situation. Many of them use a triangle theme or conflicts between the generations to point up, with almost tender satire, various truths about human nature.

Barry's thoughtful approach to life is apparent in *White Wings* (1926), a fantasy considered by some critics Barry's best play; *John* (1927), a drama about John the Baptist; *Hotel Universe* (1930), a penetrating psychological study; and *Here Come the Clowns* (1938), an allegory of good and evil. His final play, *Second Threshold* (1951), revised by Robert E. Sherwood after Barry's death, combined his flair for social comedy and his preoccupation with more serious drama.

Barrymore, Ethel, original name ETHEL BLYTHE (b. Aug. 15, 1879, Philadelphia—d. June 18, 1959, Hollywood), U.S. stage and

Ethel Barrymore, 1901

By courtesy of the Library of Congress, Washington, D.C.

film actress whose distinctive style, voice, and wit made her to her public the "first lady" of the American theatre.

The daughter of the actors Maurice and Georgiana Barrymore (qq.v.), she made her professional debut in New York in 1894 in a company headed by her grandmother, Louisa Lane Drew, a member of another prominent acting family. Her first success was scored in London in *The Bells* and *Peter the Great* (1897-98). She was starred for the first time on Broadway in *Captain Jinks of the Horse Marines* (1901).

Barrymore's notable plays include *Alice-Sit-by-the-Fire* (1905), *Mid-Channel* (1910), *Trelawny of the "Wells"* (1911), *Déclassée* (1919), *The Second Mrs. Tanqueray* (1924), *The Constant Wife* (1928), *Scarlet Sister Mary* (1931), *Whiteoaks* (1938), and *The Corn Is Green* (1942). In 1928 she opened the Ethel Barrymore Theater in New York, named in her honour, with *The Kingdom of God*.

She also appeared in vaudeville, on radio, and on television and made a number of motion pictures. Her outstanding films include *The Nightingale* (1914), and the most noteworthy were *Rasputin and the Empress* (1933), which was the only work in which she appeared with her brothers John and Lionel; *The Spiral Staircase* (1946); and *None but the Lonely Heart* (1944), for which she won an Academy Award. In her later motion pictures she was usually cast as an imperious but lovable matriarch. She published her reminiscences in *Memories, an Autobiography* (1955).

Barrymore, Georgiana, née GEORGIANA EMMA DREW (b. 1856, Philadelphia—d. July 2, 1893, Santa Barbara, Calif., U.S.), actress

and, with Maurice Barrymore, founder of the famous stage and screen family Barrymore, who occupied a preeminent position in the U.S. theatre in the first half of the 20th century.

Georgiana was a member of the Drew family (q.v.) of theatrical fame, daughter of John and Louisa Lane Drew. Her father died when she was small, and she was raised in Philadelphia and trained for the theatre by her mother. She made her debut at the Arch Street Theatre, managed by her mother, in 1872. She followed her brother John Drew, Jr., into Augustin Daly's theatre company, where she met and married Maurice Barrymore. Their children, all major stars of stage and cinema, were Ethel, John, and Lionel Barrymore. She was an actress noted for her vivacity, quick wit, and comic sense.

Barrymore, John, original name JOHN BLYTHE (b. Feb. 15, 1882, Philadelphia—d. May 29, 1942, Hollywood), actor, called the "great profile," who is remembered both for his roles as a debonair leading man and for his interpretations of Shakespeare's Richard III and Hamlet.

The son of the stage actors Maurice and Georgiana Barrymore, he studied painting in Paris but returned to the United States to make his stage debut in 1903. He became a popular light comedian but scored his greatest stage triumphs in serious roles. Most important of these were in *Justice* (1916), *Peter Ibbetson* (1917), *The Jest* (1919), *Richard III* (1920), and *Hamlet* (New York, 1922; London, 1925).

He appeared in motion pictures from 1913 and gave notable performances in *Dr. Jekyll and Mr. Hyde* (1920), *Beloved Rogue* (1927), *Moby Dick* (1930), *Grand Hotel* (1932), *Dinner at Eight* (1933), *Counsellor-at-Law* (1933), *Romeo and Juliet* (1936), and *The Great Profile* (1940). Though his talents were prodigious, and he was considered one of the greatest, and handsomest, actors of the age, he became better known for his flamboyant and often outrageous behaviour than for his acting. John Kobler's biography *Damned in Paradise* was published in 1977.

Of the second generation of Barrymores (he was the brother of Ethel and Lionel), only John had children, and both of them turned to the stage. Diana (1921-60) was an actress whose promising career was frequently interrupted by alcoholism; she committed suicide.

John Barrymore

EB Inc

Her autobiography, *Too Much, Too Soon* (1957), was made into a motion picture in 1958. His son, John Blyth Barrymore, Jr. (b. 1932), known as John Drew Barrymore, was also a film actor. He is the father of Drew Barrymore (b. 1975), one of the child stars of the motion picture *E.T.* (1982).

Barrymore, Lionel, original name LIONEL BLYTHE (b. April 28, 1878, Philadelphia—d. Nov. 15, 1954, Van Nuys, Calif., U.S.), one of the most important character actors in the early 20th century.

The son of the stage actors Maurice and Georgiana Barrymore, founders of the celebrated family of actors, he originally studied

Lionel Barrymore, still from *You Can't Take It With You*, 1938

The Museum of Modern Art/Film Stills Archive, New York City

painting in Paris for three years. On his return to New York, however, he established his reputation as an actor in such plays as *Peter Ibbetson* (1917), *The Copperhead* (1918), and *The Jest* (1919).

In 1926 he left Broadway permanently for Hollywood and began a long line of outstanding screen characterizations in such films as *The Mysterious Island* (1929), *A Free Soul* (1931), for which he won an Academy Award as best actor, *Grand Hotel* (1932), *Rasputin and the Empress* (1932), *Captains Courageous* (1937), *The Valley of Decision* (1945), *Duel in the Sun* (1947), and *Key Largo* (1948). In the "Dr. Kildare" series, the first of which was released in 1938, he played Dr. Gillespie. In his older years he projected an image of an irascible (but usually lovable) curmudgeon, a role in which he exploited to the fullest his distinctive traits—a tall, stooped posture (though, because of arthritis, he usually performed in a wheelchair from 1938 on), shaggy eyebrows, and a hoarse, rasping voice. He was also a radio actor and was noted for his annual radio performance as Scrooge in Charles Dickens' *Christmas Carol*.

We Barrymores (1951), by Lionel Barrymore as told to Cameron Shipp, is basically an autobiography but contains much information on his famous siblings John and Ethel.

Barrymore, Maurice, original name HERBERT BLYTHE (b. 1846, Fort Agra, India—d. March 26, 1905, Amityville, N.Y., U.S.), actor and sometime playwright, founder, with his wife, Georgiana Barrymore, of the renowned Barrymore theatrical family.

Herbert Blythe's father was a surveyor for the British East India Company, and the boy was sent back to England for education at Harrow and Oxford. To the dismay of his parents, who hoped he would practice law, in 1872 he became a champion amateur boxer and then went on the stage. Adopting the stage name Barrymore, he went to America in 1875. Though never a star, Barrymore was an excellent supporting actor and acted with many of the great names of theatre. He played with Augustin Daly's company, where he met Georgiana Drew, whom he married in 1876. He later joined Lester Wallack's company; on occasion he would be on the stage with his wife and son John. He took engagements in London and tried his hand at playwriting, with scant success, although (with much rewriting help) he did write original plays for Helena Modjeska and played in some of them.

James Kotsilibas-Davis' *Great Times, Good Times: The Odyssey of Maurice Barrymore* was published in 1977.

Barsento, Emilio Pucci, marchese di (marquess of): see Pucci, Emilio.

Barşıṣā, in Islāmic legend, an ascetic who succumbed to the devil's temptations and denied God.

Barşıṣā, a saintly recluse, is given care of a sick woman by her three brothers, who are going on a journey. At the devil's suggestion Barşıṣā seduces the woman. When he discovers that she has conceived, Barşıṣā kills her and buries her body to hide evidence of his sin. The devil, however, reveals the murder to the woman's brothers. Barşıṣā, panic-stricken, again succumbs to the devil, renouncing God in return for safety, only to be mocked by Satan, in the words of the Qur'an (59:16), "I am free of thee; I fear God, the Lord of the Worlds."

The legend of the recluse, who is nameless and is described variously as a Jewish ascetic or a Christian monk, appeared first in aṭ-Ṭabari's commentary on the Qur'an in the early 10th century. By 985 an author stated that the recluse was called Barşıṣā, an Aramaic name meaning "he of priestly regalia." Elements of the story are traced back to Coptic folklore, and the legend survived in the Islāmic world in several forms. By the end of the 18th century, it had made its way to England, where it became the subject of Matthew Gregory Lewis' novel *The Monk*.

Barstovian stage, uppermost major division of the Miocene epoch (23.7 million to 5.3 million years ago) in North America. The Barstovian stage follows the Hemingfordian stage and precedes the Clarendonian stage of the Pliocene epoch. It was named for exposures studied near Barstow, Calif. The Barstovian contains a distinctive mammalian fauna.

Barstow, city, San Bernardino county, south-central California, U.S., in the Mojave Desert. Lying at a junction of pioneer trails, Barstow was founded in 1880 during a silver-mining rush. First called Fishpond and then Waterman Junction, it was renamed in 1886 to honour William Barstow Strong, then president of the Santa Fe Railroad. Mining declined, but Barstow endured as a railroad town (diesel repair shops) and tourist spot. Its growth was stimulated in the 1940s by the establishment nearby of a large Marine Corps supply depot and the (now deactivated) Fort Irwin armour and desert training centre. In 1958 the Goldstone Tracking Station was established in the locality, as was Barstow Community College (1960).

Irrigated agriculture and the mining of agate, jasper, copper, and salt supplement the economy. The Mohave River Valley Museum in Barstow has displays devoted to the archaeology, minerals, and Indian lore of the area. Inc. 1947. Pop. (1990) 21,472.

Barstow, Stan, byname of STANLEY BARSTOW (b. June 28, 1928, Horbury, Yorkshire, Eng.), English novelist who achieved success with his first book, *A Kind of Loving* (1960; filmed 1962; stage play 1970).

Barstow grew up in a working-class environment and worked in the engineering industry until 1962. He was among a group of young British writers (including Alan Sillitoe, John Braine, and others) who achieved immediate success in the 1950s and '60s with their unsentimental depiction of working-class life. His later novels include *The Watchers on the Shore* (1966), *A Raging Calm* (1968), *A Season with Eros* (1971), *The Right True End* (1976), *A Brother's Tale* (1980), and *Just You Wait and See* (1986). He also wrote short stories and adapted several stories and novels for radio and television.

Bart, Jean, Bart also spelled BARTH (b. Oct. 21, 1650, Dunkirk, Fr.—d. April 27, 1702, Dunkirk), French privateer and naval officer, renowned for his skillful and daring achievements in the wars of Louis XIV.

Descended from a family of fishermen and privateers, Bart entered naval service first under the Dutch admiral Michiel de Ruyter, but when war broke out between the French and the Dutch (1672–78) he returned to Dunkirk,

where his knowledge of every detail of the coast enabled him to command a French fleet of small privateering vessels with great success. He took 81 prizes in six battles and was rewarded by Louis XIV with the rank of lieutenant. In the War of the Grand Alliance (1689–97) he was taken prisoner by the English but escaped from Plymouth and rowed for 52 hours to the French coast. Promoted to captain, he commanded the *Alcyon* at the Battle of Beachy Head (1690) and afterward a division of ships at Dunkirk.

Bart defended Dunkirk during the English attacks of 1694–95. In June 1696, when France was facing famine, he engaged a Dutch squadron off the coast of the Netherlands and

Bart, detail of an engraving by the studio of Nicolas Bonnart; in the Bibliothèque Nationale, Paris

By courtesy of the Bibliothèque Nationale, Paris

captured a convoy of 96 ships loaded with Russian and Polish wheat. For this exploit, the king made him a member of the nobility.

Given command of a squadron, Bart escorted the Prince de Conti (François-Louis de Bourbon), candidate for the Polish crown, to Danzig in 1697, slipping six frigates through a tight enemy blockade. By the end of the war his division had destroyed 30 warships and captured more than 200 merchant ships.

Bartas, Guillaume de Salluste, seigneur du (lord of) (b. 1544, Montfort, near Auch, Fr.—d. July 1590, Coudons), author of *La Semaine* (1578), an influential poem about the creation of the world.

Though he tried to avoid participating in the Wars of Religion, du Bartas was an ardent Huguenot and a trusted counsellor of Henry of Navarre. His aim was to use the new poetic techniques introduced into France by the literary group known as La Pléiade for the presentation of distinctively Protestant views. He was himself dissatisfied with his first biblical epic, *Judith* (1574). On the publication of *La Semaine*, however, du Bartas was hailed as a major poet. His prestige was all the greater because Pierre de Ronsard, his contemporary, had failed in his ambition to compose a first-class epic in French. *La Semaine* did not remain popular in France for long; its style is marred by numerous neologisms and ungainly compound adjectives, and the didactic intent is too obvious. In fact, the poem made a more lasting impression in England, where its Protestant teaching was more generally acceptable. Sir Philip Sidney, Edmund Spenser, and John Milton were among the English poets influenced by du Bartas.

Bartenstein, Johann Christoph, Freiherr von (baron of) (b. Oct. 23, 1689, Strasbourg, Alsace—d. Aug. 6, 1767, Vienna), Austrian statesman and trusted counsellor of Emperor Charles VI. He created the political system that was based upon the Pragmatic Sanction; it was intended to guarantee the peaceful accession of Charles VI's daughter Maria Theresa to the entire Habsburg inheritance. He became the

most powerful minister in the Habsburg dominions when Charles died in 1740.

Joining the imperial chancellery in 1726, Bartenstein gradually won the confidence of Charles VI and was subsequently appointed secretary of state (1733). After 1735 his influence with the emperor was paramount. His was the primary role in negotiating the marriage of Maria Theresa to Francis Stephen of Lorraine (later Emperor Francis I) and implementing the diplomacy required to promote her husband's eventual accession to the imperial title.

As a chief adviser to Maria Theresa, Bartenstein steadily opposed concessions to Prussia and generally pursued an anti-English, pro-French foreign policy. He was finally displaced as chief minister in 1753 by Wenzel Anton von Kaunitz. Bartenstein's honesty and discretion were matched by his self-righteousness toward foreign diplomats and obsequiousness to his patrons; his efficiency and legal knowledge, however, made him an indispensable figure in Habsburg diplomacy.

barter, the direct exchange of goods or services—without an intervening medium of exchange or money—either according to established rates of exchange or by bargaining. Barter is common among nonliterate societies, particularly in those communities with some developed form of market. Goods may be bartered within a group as well as between groups, although gift exchange probably accounts for most intragroup trade, particularly in small and relatively simple societies. Where barter and gift exchange coexist, as among the peoples of the Trobriand Islands of Melanesia, the simple barter of ordinary household items or food is distinguished from the ceremonial exchange, which serves other than economic purposes. See also gift exchange.

Barth, Heinrich (b. Feb. 16, 1821, Hamburg [Germany]—d. Nov. 25, 1865, Berlin, Prussia [Germany]), German geographer and one of the great explorers of Africa.

Educated in the classics at the University of Berlin, Barth was a competent linguist who was fluent in French, Spanish, Italian, English, and Arabic. He traveled the Mediterranean coastal areas that are now part of Tunisia and Libya (1845–47) and published his observations in 1849.

Early in 1850, with the explorer James Richardson and the geologist and astronomer Adolf Overweg, he set out from Tripoli across the Sahara on a British-sponsored expedition to the western Sudan (a term then in use for most of central West Africa). When Richardson died a year later in what is now northern Nigeria, Barth assumed command. He explored the area south and southeast of Lake Chad and mapped the upper reaches of the Benue River. Overweg died in September

Heinrich Barth

By courtesy of the Royal Geographical Society, London

1852, and Barth traveled to the city of Timbuktu, now in Mali. He remained there for six months before returning, via Tripoli, to London (1855).

Despite ill health and the loss of his colleagues, he had traveled some 10,000 miles (16,000 km), laid down accurate routes by dead reckoning, and returned to Europe with the first account of the middle section of the Niger River. His four large volumes, *Reisen und Entdeckungen in Nord- und Central-Afrika in den Jahren 1849 bis 1855* (1857–58; "Travels and Discoveries in North and Central Africa in the Years 1849–1855"), remain one of the most comprehensive works on the area and contain an immense amount of anthropological, historical, and linguistic information as well as the daily travel details he so assiduously recorded. His work was honoured and rewarded financially by the British government. Later travels took him to Turkey and Asia Minor as well as to Spain, Italy, and the Alps. He was appointed professor of geography at the University of Berlin (1863).

Barth, Jean (French privateer): see Bart, Jean.

Barth, John (Simmons, Jr.) (b. May 27, 1930, Cambridge, Md., U.S.), American writer best known for novels that combine philosophical depth and complexity with biting satire and boisterous, frequently bawdy humour. Much of Barth's writing is concerned with the seeming impossibility of choosing the right action in a world that has no absolute values.

Barth grew up on the eastern shore of Maryland, the locale of most of his writing, and studied at Johns Hopkins University in Baltimore, where he graduated with an M.A. in 1952. The next year, he began teaching at Pennsylvania State University; he moved in 1965 to the State University of New York at Buffalo as professor of English and writer in residence. He was appointed professor of English and creative writing at Johns Hopkins University in 1973.

Barth's first two novels, *The Floating Opera* (1956) and *The End of the Road* (1958), describe characters burdened by a sense of the futility of all action and the effects of these characters upon the less self-conscious, more active people around them. Barth forsook realism and modern settings in *The Sot-Weed Factor* (1960), a picaresque tale that burlesques the early history of Maryland and parodies the 18th-century English novel. All three novels appeared in revised editions in 1967.

Giles Goat-Boy (1966) is a bizarre tale of the career of a mythical hero and religious prophet, set in a satirical microcosm of vast, computer-run universities. His work *Lost in the Funhouse* (1968) consists of short, experimental pieces, some designed for performance, interspersed with short stories based on his own childhood. It was followed by *Chimera* (1972), a volume of three novellas, and *Letters* (1979), an experimental novel. The novels *Sabbatical* (1982) and *The Tidewater Tales* (1987) are more traditional narratives. *Once Upon a Time: A Floating Opera* (1994) combined the genres of novel and memoir in the form of a three-act opera.

Barth, Karl (b. May 10, 1886, Basel, Switz.—d. Dec. 9/10, 1968, Basel), Swiss theologian, among the most influential of the 20th century. Closely supported by his lifelong friend and colleague, the theologian Eduard Thurneysen, he initiated a radical change in Protestant thought, stressing the "wholly otherness of God" over the anthropocentrism of 19th-century liberal theology. His vigorous opposition to German National Socialism led to his suspension as chairman of theology at the University of Bonn. Subsequently, at Basel, he continued work on his monumental *Church*

Dogmatics (completing four volumes) and delivered more than 500 sermons.

Early life and career. Barth was born in Basel, the son of Fritz Barth, a professor of New Testament and early church history at Bern, and Anna Sartorius. He studied at the universities of Bern, Berlin, Tübingen, and Marburg. At Berlin he attended the liberal theologian Adolf von Harnack's seminar, and

Karl Barth, 1965

Horst Tappe

at Marburg he came under the influence of Wilhelm Herrmann and became deeply interested in the thought of the early 19th-century German theologian Friedrich Schleiermacher and in the nature of scientific method. After serving a curacy in Geneva from 1909 to 1911, he was appointed to the working-class parish of Safenwil, in Aargau canton.

The 10 years Barth spent at Safenwil as a minister of the Gospel were the formative period of his life. Deeply shocked by the disaster that had overtaken Europe in World War I and disillusioned by the collapse of the ethic of religious idealism, he questioned the liberal theology of his German teachers and its roots in the rationalist, historicist, and dualist thought that stemmed from the Enlightenment. Through study of the teaching of St. Paul in the Epistle to the Romans, he struggled to clarify the relation between justification and social righteousness, which governed all he had to say in later life about the relation of the Gospel to the power of the state and the oppression of the poor. Particularly important during this period were his visits to Bad Boll, where he met the Moravian preacher Christoph Blumhardt and gained an overwhelming conviction about the victorious reality of Christ's resurrection. Out of this experience came a series of passionate addresses, sermons, and popular expositions of the faith, in which he called for a return to the message of the Bible and to the theology of the Reformation. Some of these were later collected under the title *Das Wort Gottes und die Theologie* (1924; *The Word of God and the Word of Man*).

Years in Germany. His first major work, *Der Römerbrief* (1919; *The Epistle to the Romans*), established his position as a notable theologian with a new and arresting message about the sheer Godness of God and the unlimited range of his grace. Barth's style was vividly lit up by brilliant similes and turns of phrase and by irrepressible humour. The first of six heavily revised editions followed in 1922. The critical and explosive nature of his theology came to be known as "dialectical theology," or "the theology of crisis"; it initiated a trend toward neoorthodoxy in Protestant theology.

On the basis of this publication, Barth in 1921 was appointed professor of Reformed theology at the University of Göttingen; he was later appointed to chairs at Münster (1925) and Bonn (1930). In Göttingen he began an exhaustive study of the great Protestant scholastic theologians as well as the Church Fathers

as the basis for his lectures on instruction in the Christian religion. It was at Münster that he wrote his first attempt at dogmatics, *Die Lehre vom Worte Gottes: Prolegomena zur christlichen Dogmatik* (1927; *The Doctrine of the Word of God: Prolegomena to Church Dogmatics*), in which his characteristic account of the Word of God, divine revelation, and the Trinity, Incarnation, and the Holy Spirit were clearly adumbrated. However, his engagement with epistemological issues made him dissatisfied with what he had done, so that when he moved to Bonn he rethought the problem of the theological method in critical discussion with the philosopher of science Heinrich Scholz. It was in this connection that he produced his celebrated study of St. Anselm, *Fides quaerens intellectum* (1931). In the following year there appeared the first part of his massive *Church Dogmatics*.

In 1934 he published *Nein! Antwort an Emil Brunner* (Eng. trans., "No!" in *Natural Theology* [1946]), a response to Brunner's essay "Nature and Grace." In his response, Barth traced the religious syncretism and support of anti-Semitism of the "German Christians" to natural theology and the perversion of historic Christianity. This brought him into conflict with those who wanted to bring theology into line with the new ideology of National Socialism. With the accession of Adolf Hitler to power in 1933, Barth became deeply involved in the church struggle. He was one of the founders of the so-called Confessing Church, which reacted vigorously and indignantly against Nazi nationalist ideology of "blood and soil" and the attempt to set up a "German Christian" church. The famous Barmen Declaration of 1934 (see Barmen, Synod of), largely based on a draft that Barth had prepared, expressed his conviction that the only way to offer effective resistance to the secularizing and paganizing of the church in Nazi Germany was to hold fast to true Christian doctrine. Although a Swiss citizen, Barth was not immune from persecution; his refusal to take the oath of unconditional allegiance to the Führer cost him his chair in Bonn in 1935. He was quickly offered the chair of theology in his native Basel, however. From that date until the end of the war, he continued to champion the cause of the Confessing Church, of the Jews, and of oppressed people generally.

Church Dogmatics. Of his theological works, perhaps the best remembered is Barth's massive study *Kirchliche Dogmatik* (1932–67; *Church Dogmatics*), a remarkable contribution to 20th-century theology. *Church Dogmatics* grew year by year out of his class lectures; though incomplete, it eventually filled four volumes in 12 parts, of which Barth regarded volume II, parts 1 and 2, which are devoted to the doctrine of God, as the highlight. It is particularly notable for its powerful epistemology and his account of the Act and Being of God, in which he integrated dynamic and ontological factors in theological knowledge.

As a theologian Barth was concerned to establish the truth that God can be known only in accordance with his nature and to reject the 19th-century view that saw an identity between the Spirit of God and religious self-consciousness or between the laws of God and the natural structures of man's life and history. Drawing on the Church Fathers and the Reformers, Barth demanded a return to the prophetic teaching of the Bible (in Jeremiah and the writings of Paul), of which he believed the Reformers were authentic exponents. He accepted much trenchant criticism of historical Christianity from John Calvin, Martin Luther, Søren Kierkegaard, Fyodor Dostoyevsky, and Franz Overbeck and found positive help in the writings of Isaak Dorner, Wilhelm Vilmar, Friedrich Kohlbrügge, and Johann and Christoph Blumhardt. The essence of the Christian message, he affirmed, was the

overwhelming love of the absolutely supreme, transcendent God, who comes in infinite condescension to give himself to mankind in unconditional freedom and grace.

International reputation and influence. After the war, Barth was invited back to Bonn, where he delivered the course of lectures published in 1947 as *Dogmatik im Grundriss (Dogmatics in Outline)*, one of the most influential of his smaller works. He continued to interest himself keenly in current theological discussion, participating in controversies regarding baptism, hermeneutics, "demythologizing," and others. His authority and prestige made a profound impression when he spoke at the opening meeting of the Conference of the World Council of Churches in Amsterdam in 1948 and later when he gave the celebrated lectures published as *Einführung in die evangelische Theologie (Evangelical Theology: An Introduction)* in Princeton, N.J., and Chicago in 1962. Another notable event in his later years was a visit to Rome following the second Vatican Council (1962–65), of which he wrote with characteristic grace and humour in *Ad limina apostolorum*.

Barth made regular visits to the prison in Basel, and his sermons to the prisoners, *Den Gefangenen Befreiung: Predigten aus den Jahren 1954–59* (1959; *Deliverance to the Captives*), reveal in a unique way the combination of evangelical passion and social concern that had characterized all his life. Barth died in Basel at the age of 82. (T.F.To.)

BIBLIOGRAPHY. Eberhard Busch, *Karl Barth: His Life from Letters and Autobiographical Texts* (1976), is not a critical biography but rather a picture of Barth in his own words, by the man who served as his last personal assistant. Georges Casalis, *Portrait of Karl Barth* (1963, reprinted 1981), provides a portrait of the man and his work. T.H.L. Parker, *Karl Barth* (1970), recounts Barth's spiritual pilgrimage and the development of his theological method. Studies of his theology include Thomas F. Torrance, *Karl Barth: An Introduction to His Early Theology, 1910–1931* (1962); Geoffrey W. Bromiley, *An Introduction to the Theology of Karl Barth* (1979), which provides an introduction to the *Church Dogmatics*; and Charles T. Waldrop, *Karl Barth's Christology* (1984).

Barthélemy-Saint-Hilaire, Jules (b. Aug. 19, 1805, Paris, France—d. Nov. 24, 1895, Paris), French politician, journalist, and scholar.

Barthélemy-Saint-Hilaire worked briefly for the Ministry of Finance (1825–28) before becoming a journalist. In 1838 he became professor of ancient philosophy at the Collège de France. Following the Revolution of 1848, he was elected to the national Chamber of Deputies from the district of Seine-et-Oise, but he withdrew after the coup d'état of 1851. Reelected deputy from Seine-et-Oise in 1869, he aligned with the moderates against the dictatorial policies of Napoleon III and joined in the proposal that Adolphe Thiers, a republican politician, become head of the executive power. Appointed an unpaid secretary to Thiers, Barthélemy-Saint-Hilaire also became senator for life in 1875, was vice president of the Senate (1880), and served as minister of foreign affairs under Premier Jules Ferry (1880–81).

Barthélemy-Saint-Hilaire wrote in the areas of history, sociology, political economy, and languages. He published a translation of the works of Marcus Aurelius (1876) and wrote several studies of Oriental religions, but he is perhaps best remembered for his monumental 35-volume translation (1833–95) of the works of Aristotle.

Barthes, Roland (Gérard) (b. Nov. 12, 1915, Cherbourg, France—d. March 26, 1980, Paris), French social and literary critic whose writings on semiotics, the formal study of symbols and signs pioneered by Ferdinand

de Saussure, helped establish structuralism and the New Criticism as leading intellectual movements.

Barthes studied at the University of Paris, where he took a degree in classical letters in 1939 and in grammar and philology in 1943. After working (1952–59) at the Centre National de la Recherche Scientifique, he was appointed to the École Pratique des Hautes Études. In 1976 he became the first person to hold the chair of literary semiology at the Collège de France.

His first book, *Le Degré zéro de l'écriture* (1953; *Writing Degree Zero*), was a literary manifesto that examined the arbitrariness of the constructs of language. In subsequent books—including *Mythologies* (1957), *Essais critiques* (1964; *Critical Essays*), and *La Tour Eiffel* (1964; *The Eiffel Tower and Other Mythologies*)—he applied the same critical apparatus to the "mythologies" (i.e., the hidden assumptions) behind popular cultural phenomena from advertising and fashion to the Eiffel Tower and wrestling. His *Sur Racine* (1963; *On Racine*) set off a literary furor in France pitting Barthes against traditional academics who thought this "new criticism," which viewed texts as a system of signs, was desecrating the classics. Even more radical was *S/Z* (1970), a line-by-line semiological analysis of a short story by Honoré de Balzac in which Barthes stressed the active role of the reader in constructing a narrative based on "cues" in the text.

By the 1970s Barthes' theories had become extremely influential not only in France but throughout Europe and in the United States. Other leading radical French thinkers who influenced or were influenced by Barthes included psychoanalyst Jacques Lacan, sociohistorian Michel Foucault, and philosopher Jacques Derrida. Two of Barthes's later books established his late-blooming reputation as a stylist and writer. He published an "antiautobiography," *Roland Barthes par Roland Barthes* (1975; *Roland Barthes by Roland Barthes*), and his *Fragments d'un discours amoureux* (1977; *A Lover's Discourse*), an account of a painful love affair, was so popular it quickly sold more than 60,000 copies in France.

Barthold, Wilhelm: see Bartold, Vasily V(ladimirovich).

Bartholdi, Frédéric-Auguste (b. April 2, 1834, Colmar, Alsace, France—d. Oct. 4, 1904, Paris), French sculptor of the Statue of Liberty in New York Harbor.

Bartholdi trained to be an architect in Alsace and Paris and then studied painting with Ary Scheffer and sculpture with J.-F. Soitoux. He toured the Middle East in 1855 with the painter J.-L. Gérôme. In 1865 he and several others conceived an idea for a monument to the Franco-American alliance of 1778. Beginning work in 1870, Bartholdi designed the huge statue on his own initiative and was able to see its construction through using funds he raised in both France and the United States. Dedicated in 1886, the statue was titled, in full, "Liberty Enlightening the World" and was given to the United States by France. The Statue of Liberty is Bartholdi's best-known work, but his masterpiece is the "Lion of Belfort" (completed 1880), which is carved out of the red sandstone of a hill that towers over the city of Belfort in eastern France. This is generally regarded as the best of a number of patriotic sculptures by Bartholdi that were inspired by the French defeat in the Franco-German War of 1870–71.

Bartholin, Caspar Berthelsen, Latin BARTHOLINUS (b. Feb. 12, 1585, Malmö, Den. [now in Sweden]—d. July 13, 1629, Sorø, Zealand, Den.), Danish physician and theolo-

gian who wrote one of the most widely read Renaissance manuals of anatomy.

At the University of Padua (1608–10) Bartholin conducted anatomical studies under the famed Italian anatomist Hieronymus Fabricius ab Aquapendente. These formed the basis

Caspar Bartholin, detail of a lithograph by Baerentzen after a contemporary portrait by an unknown artist, 1615

Archiv für Kunst und Geschichte, Berlin

for his manual *Anatomicae Institutiones Corporis Humani* (1611; "Textbook of Human Anatomy"). A professor at the University of Copenhagen (1613–29), he was first to describe the olfactory nerve (associated with the sense of smell) as the first cranial nerve. He also identified the small lubricating gland—known as Bartholin's gland—located near the vaginal opening in female mammals.

Bartholin, Erasmus, Latin BARTHOLINUS (b. Aug. 13, 1625, Roskilde, Den.—d. Nov. 4, 1698, Copenhagen), Danish physician, mathematician, and physicist who discovered the optical phenomenon of double refraction.

While professor of medicine (1657–98) at the University of Copenhagen, Bartholin observed that images seen through Icelandic feldspar (calcite) were doubled and that, when the crystal was rotated, one image remained stationary while the other rotated with the crystal. Perceiving that light passing through calcite was split into two rays, he called the stationary image the "ordinary beam" and the moving image the "extraordinary beam." Although Bartholin himself was unable to explain double refraction, it was recognized as a serious contradiction to Isaac Newton's optical theories.

Bartholin, Thomas, Latin BARTHOLINUS (b. Oct. 20, 1616, Copenhagen, Den.—d. Dec. 4, 1680, Copenhagen), Danish anatomist and mathematician who was first to describe fully the entire human lymphatic system (1652).

He and his elder brother, Erasmus Bartholin, were the sons of the eminent anatomist Caspar Bartholin. A student of the Dutch school of anatomists, Bartholin supported the English physician William Harvey's theory of blood circulation. He taught at the University of Copenhagen (1646–61) and served as physician to King Christian V (1670–80).

Bartholomaeus ANGLICUS (Latin), English BARTHOLOMEW THE ENGLISHMAN (fl. c. 1220–40), Franciscan encyclopaedist who was long famous for his encyclopaedia, *De proprietatibus rerum* ("On the Properties of Things").

Bartholomaeus lectured in divinity at the University of Paris and became a Franciscan about 1225. Though primarily interested in Scripture and theology, he covered in his 19-volume encyclopaedia all the customary knowledge of his time and was the first writer to make conveniently available the views of Greek, Jewish, and Arabic scholars on medical and scientific subjects. The immense pop-

ularity of his work is shown by the very large number of manuscript copies of it found in European libraries and by the fact that it was regularly lent out to scholars at the University of Paris. Translated into English by John of Trevisa and printed about 1495, it was highly influential in Tudor England.

Bartholomäussee: see Königssee.

Bartholomé, Albert, in full PAUL-ALBERT BARTHOLOMÉ (b. Aug. 29, 1848, Thiverval, France—d. Oct. 31, 1928, Paris), sculptor whose works, particularly his funerary art, made him one of the best known of modern French sculptors.

Bartholomé began his career as a painter, studying at the Académie des Beaux-Arts. Wanting to construct a monument to his dead wife, he turned to sculpture in 1886. Though he had no formal training, he made a careful study of nature and of the masterpieces of the past. His reputation was established with the "Monument to the Dead" (1895) in the Père-Lachaise Cemetery, Paris, a piece of architectural sculpture on a grand scale. Composed of a number of mourning figures in various attitudes of grief, it is non-Christian in feeling,

"Monument to the Dead," stone sculpture by Bartholomé, 1895; in the Père-Lachaise Cemetery, Paris

Giraudon—Art Resource

though situated in a Christian cemetery. This success led to commissions for a number of funerary monuments. His later works suggest the influence of Auguste Rodin.

Bartholomew I, original name DIMITRIOS ARCHONTONIS (b. 1940, Imbros [now Gökçeada], Turkey), 270th ecumenical patriarch of the Eastern Orthodox church from 1991.

After graduating from the patriarchal Seminary of Halki, located near Istanbul, Archontonis was ordained a priest and went on to earn a doctorate in canon law from the Pontifical Institute in Rome. He also studied in Switzerland and Germany. He then returned to Istanbul and joined the staff of his patriarchate, and his academic and linguistic expertise led to his consecration as bishop in 1973. He helped administer the affairs of the patriarchate of Constantinople under the ecumenical patriarch Dimitrios, and he represented the patriarchate at meetings of the World Council of Churches. Bartholomew was elected metropolitan of Chalcedon in 1990. On Oct. 22, 1991, in Istanbul, the Holy Synod of the Eastern Orthodox church elected him archbishop of Constantinople and ecumenical patriarch, succeeding Dimitrios. Bartholomew thus became the spiritual leader—"first among equals"—of all the self-governing Eastern Orthodox churches throughout the world.

The beginning of Bartholomew's patriarchate was characterized by tensions over what the Orthodox church considered to be Roman Catholic and Protestant encroachments into its strongholds in the former Soviet republics. In an unusual move, Bartholomew conducted a rare meeting of Orthodox leaders in Istanbul in March 1992. The patriarchs and archbishops in attendance affirmed church unity while at the same time chastizing Roman Catholics and certain evangelical Protestant groups for treating traditional Orthodox countries as missionary territories.

Bartholomew, SAINT (fl. 1st century AD; d. traditionally Albanopolis, Armenia; Western feast day August 24; date varies in Eastern churches), one of the Twelve Apostles.

Apart from the mentions of him in four of the Apostle lists (Mark 3:18, Matt. 10:3, Luke 6:14, and Acts 1:13), nothing is known about him from the New Testament. Bartholomew is a family name meaning "son of [Hebrew: *bar*] Tolmai, or Talmi," so he may have had another personal name. For that reason and because he was always associated with the Apostle St. Philip in the Gospel lists,

a 9th-century tradition identified him with Nathanael, who, according to John 1:43–51, was called with Philip by Jesus. Upon seeing Nathanael, Jesus said, "Behold, an Israelite indeed, in whom is no guile!" This identification sought to explain how the otherwise unknown Bartholomew could be mentioned in the Apostle lists, while Nathanael, whose call is explicitly described by John, does not figure in them. His full name would then be Nathanael bar Tolmai.

The 4th-century Bishop Eusebius of Caesarea in his *Ecclesiastical History* relates that, when the 2nd-century teacher St. Pantaenus of Alexandria made a visit to India, he found the Hebrew "Gospel According to Matthew," which had been left behind there by Bartholomew. Traditionally, Bartholomew also served as a missionary to Ethiopia, Mesopotamia, Parthia (in modern Iran), Lycaonia (in modern Turkey), and Armenia. The apostle is said to have been martyred by flaying and beheading at the command of the Armenian king Astyages. His relics were supposedly taken to the Church of St. Bartholomew-in-the-Tiber, Rome.

Bartholomew, John George (b. March 22, 1860, Edinburgh—d. April 13, 1920, Cintra, Port.), cartographer and map and atlas publisher who improved the standards of British

cartography and introduced into Great Britain the use of contours and systematic colour layering to show relief.

The eldest son of the Edinburgh map publisher John Bartholomew (1831–93), he concerned himself with producing new geographical works as well as with technical improvements in map production. He published major atlases of Scotland (1895) and England and Wales (1903) and initiated a great physical atlas, but only two volumes appeared, the *Atlas of Meteorology* (1899) and the *Atlas of Zoogeography* (1911). He also began compiling *The Times Survey Atlas of the World*, published in 1921 by his son John Bartholomew (1908–62), who also edited the new *Times Atlas of the World* (1955).

Barthou, (Jean-) Louis (b. Aug. 25, 1862, Oloron-Sainte-Marie, Fr.—d. Oct. 9, 1934, Marseille), French premier (1913), conservative statesman, and long-time colleague of Raymond Poincaré. He was assassinated with King Alexander of Yugoslavia during the latter's visit to France in 1934.

Barthou, c. 1922
H Roger-Viollet—Harlingue

Trained as a lawyer and first elected a deputy in 1889, Barthou filled various posts in different ministries and, as premier from March to December 1913, secured the passage of a three years' compulsory military service bill (July 19, 1913). After serving in the cabinets of Paul Painlevé, Aristide Briand, and Raymond Poincaré, Barthou represented France at the Genoa Conference (1922), entered the Senate, and became chairman of the reparations commission. In July 1926 he became minister of justice under Poincaré. He was named foreign minister in the coalition ministry of Gaston Doumergue shortly before his death.

Bartica, town, north-central Guyana, in tropical rain forests in which the Essequibo, Mazaruni, and Cuyuni rivers meet. A small commercial centre, Bartica is situated at the head of navigation by small oceangoing ships, on the Essequibo River 50 mi (80 km) inland from the Atlantic Ocean, and it is linked by air with Georgetown, the national capital. Roads lead to the goldfields and diamond fields of the interior. Pop. (1980) 6,223.

Bartle Frere, Mount, mountain in Belenden-Ker Range, northeastern Queensland, Australia. It is the highest point in the state and rises to 5,287 ft (1,611 m) in an area reserved as a national park. Its slopes have the climate of a rain forest and provide cover for a variety of tropical plants, birds, and mammals. The peak was named in 1873 by George A.F.E. Dalrymple, a Scottish explorer, in honour of Sir Henry Bartle Edward Frere, governor of Bombay (1862–67).

Bartlesville, city, seat (1907) of Washington county, northeastern Oklahoma, U.S., on the Caney River. It was settled in the 1870s around Jacob Bartles' trading post. Growth was spurred by the discovery of oil in 1897 and the arrival of the Santa Fe Railway in 1899. A replica of the first commercial well (Nellie Johnstone No. 1) in Oklahoma is in

Johnstone Park, site of the original tapping. Oil and gas production, zinc smelting, and the manufacture of oil-field equipment are the economic mainstays. A U.S. Bureau of Mines petroleum experimental station is in the city. Bartlesville Wesleyan College was founded in 1880. Woolaroc Museum, established by oilman Frank Phillips and housing a collection of Western art, is 14 mi (23 km) southwest. Tom Mix was deputy marshal of nearby Dewey before becoming a famous silent-screen movie star; his elaborate cowboy gear is displayed in a museum. Inc. 1897. Pop. (1990) 34,256.

Bartlett, Sir Frederic C(harles) (b. Oct. 20, 1886, Stow-on-the-Wold, Gloucestershire, Eng.—d. Sept. 30, 1969, Cambridge, Cambridgeshire), British psychologist best known for his studies of memory.

Through his long association with Cambridge University, Bartlett strongly influenced British psychological method, emphasizing a descriptive, or case study, approach over more statistical techniques. In 1922 he became director of the Cambridge Psychological Laboratory and in 1931 was appointed the university's first professor of experimental psychology, retaining that position until his retirement in 1952. Bartlett was elected to the Royal Society in 1932 and was knighted in 1948.

In his major work, *Remembering: A Study in Experimental and Social Psychology* (1932), Bartlett advanced the concept that memories of past events and experiences are actually mental reconstructions that are coloured by cultural attitudes and personal habits, rather than being direct recollections of observations made at the time. In experiments beginning in 1914, Bartlett showed that very little of an event is actually perceived at the time of its occurrence but that, in reconstructing the memory, gaps in observation or perception are filled in with the aid of previous experiences. A later work, *Thinking: An Experimental and Social Study* (1958), broke no new theoretical ground but added observations on the social character of human thinking.

Bartlett, John (b. June 14, 1820, Plymouth, Mass., U.S.—d. Dec. 3, 1905, Cambridge, Mass.), American bookseller and editor best known for his *Familiar Quotations*.

John Bartlett
By courtesy of Little, Brown and Co

At the age of 16 Bartlett became an employee of the Harvard University bookstore, where he became so versed in book knowledge that the advice "Ask John Bartlett" became common on the Harvard campus. Eventually he came to own the store, and in 1855 he published the first edition of his *Familiar Quotations*, based largely on the notebook that he kept for the benefit of his customers. Later editions of the work were greatly expanded, and, from the fourth edition on, these were published by Little, Brown and Company, Boston, which Bartlett joined in 1863. The book went through nine editions in his lifetime and appeared in a centennial edition, the 13th, in 1955. Bartlett also wrote books on chess and angling and, after many years

of labour, a *Complete Concordance to Shakespeare's Dramatic Works and Poems* (1894), a standard reference work that surpassed any of its predecessors in the number and fullness of its citations.

Bartlett, John Russell (b. Oct. 23, 1805, Providence, R.I., U.S.—d. May 28, 1886, Providence), bibliographer who made his greatest contribution to linguistics with his pioneer work, *Dictionary of Americanisms: A Glossary of Words and Phrases, Usually Regarded as Peculiar to the United States* (1848). It went through four editions and was translated into Dutch and German.

John Russell Bartlett
By courtesy of The Rhode Island Historical Society

Appointed commissioner for the survey of the boundary between the United States and Mexico in 1850–53, he wrote as a result *Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora and Chihuahua . . .*, 2 vol. (1854, reprinted 1965). Robert V. Hine, *Bartlett's West: Drawing the Mexican Boundary* (1965), assesses Bartlett's drawings and his stature as an interpreter of the West. As secretary of the state of Rhode Island he rearranged and classified the state records and prepared bibliographies and compilations on state history. Bartlett assisted John Carter Brown in acquiring and cataloging his noted book collection, now in the John Carter Brown Library on the campus of Brown University.

Bartlett Deep, also called BARTLETT TROUGH (Caribbean Sea): see Cayman Trench.

Bartmannkrug, also called BEARDED-MAN JUG, type of 16th-century German jug, characterized by a round belly and a mask of a

Salt-glazed stoneware *Bartmannkrug* by Jan Emens, Rhineland, c. 1575; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum London photograph: EB Inc

bearded man applied in relief to the neck. This salt-glazed stoneware jug is associated particularly with Cologne and Frechen, where it was manufactured in considerable numbers. It was sometimes called a "Bellarmine," the mask being regarded as a satire on Cardinal (later Saint) Robert Bellarmine, a Roman Catholic cleric who opposed Protestantism.

The jugs were exported in considerable quantities to England, where they were known as "graybeards." The jug is usually finished in golden brown or blue and gray, and the mask descends from the rim of the neck so that the rectangular beard falls over the shoulder and onto the belly of the jug. Other raised designs were invariably added, including rosettes, medallions, leaves, ornamental friezes, or coats of arms.

Bartók, Béla (b. March 25, 1881, Nagyszentmiklós, Hung., Austria-Hungary—d. Sept. 26, 1945, New York, N.Y., U.S.), composer, pianist, ethnomusicologist, and teacher, noted for the Hungarian flavour of his major musical works, which include orchestral works, string quartets, piano solos, several stage works, a cantata, and a number of settings of folk songs for voice and piano.

Bartók, photograph by Fritz Reiner
Mrs. Fritz Reiner

Career in Hungary. Bartók spent his childhood and youth in various provincial towns, studying the piano with his mother and later with a succession of teachers. He began to compose small dance pieces at the age of nine, and two years later he played in public for the first time, including a composition of his own in his program.

Following the lead of another eminent Hungarian composer, Ernő Dohnányi, Bartók undertook his professional studies at the Royal Hungarian Academy of Music in Budapest rather than in Vienna. He developed rapidly as a pianist but less so as a composer. His discovery in 1902 of the music of Richard Strauss stimulated his enthusiasm for composition. At the same time a spirit of optimistic nationalism was sweeping Hungary, inspired by Ferenc Kossuth and his Party of Independence. As other members of Bartók's generation demonstrated in the streets, the 22-year-old composer wrote a symphonic poem, *Kossuth*, portraying in a style that was reminiscent of Strauss, though with a Hungarian flavour, the life of the great patriot Lajos Kossuth, Ferenc's father, who had led the revolution of 1848–49. Despite a scandal at the first performance, occasioned by a distortion of the Austrian national anthem, the work was received enthusiastically.

Shortly after Bartók completed his studies in 1903, he and the Hungarian composer Zoltán Kodály, who collaborated with Bartók, discovered that what they had considered Hungarian folk music and drawn upon for their compositions was instead the music of city-dwelling

Gypsies. A vast reservoir of authentic Hungarian peasant music was subsequently made known by the research of the two composers. The initial collection, which led them into the remotest corners of Hungary, was begun with the intention of revitalizing Hungarian music. Both composers not only transcribed many folk tunes for the piano and other media but also incorporated into their original music the melodic, rhythmic, and textural elements of peasant music. Ultimately, their own work became suffused with the folk spirit.

Bartók was appointed to the faculty of the Academy of Music in 1907 and retained that position until 1934, when he resigned to become a working member of the Academy of Sciences. His holidays were spent collecting folk material, which he then analyzed and classified, and he soon began the publication of articles and monographs.

At the same time, Bartók was expanding the catalog of his compositions, with many new works for the piano, a substantial number for orchestra, and the beginning of a series of six string quartets that was to constitute one of his most impressive achievements. His first numbered quartet (1908) shows few traces of folk influence, but in the others that influence is thoroughly assimilated and omnipresent. The quartets parallel and illuminate Bartók's stylistic development: in the second quartet (1915–17) Arab elements reflect the composer's collecting trip to North Africa; in the third (1927) and fourth (1928) there is a more intensive use of dissonance; and in the fifth (1934) and sixth (1939) there is a reaffirmation of traditional tonality.

In 1911 Bartók wrote his only opera, *Duke Bluebeard's Castle*, an allegorical treatment of the legendary wife murderer, with a score permeated by characteristics of old Hungarian folk song, especially in the speechlike rhythms of the text setting. The technique is comparable to that used by the French impressionist composer Claude Debussy in his opera *Pelléas et Mélisande* (1902), and Bartók's opera has other impressionistic qualities as well. A ballet, *The Wooden Prince* (1914–16), and a pantomime, *The Miraculous Mandarin* (1918–19), followed; thereafter he wrote no more for the stage.

Unable to travel during World War I, Bartók devoted himself to composition and the study of the collected folk music. During the short-lived proletarian dictatorship of the Hungarian Soviet Republic in 1919, he served as a member of the Music Council with Kodály and Dohnányi.

His most productive years were the two decades that followed the end of World War I in 1918, when his musical language was completely and expressively formulated. He had assimilated many disparate influences: in addition to those already mentioned—Strauss and Debussy—there were also the 19th-century Hungarian composer Franz Liszt and the modernists Igor Stravinsky and Arnold Schoenberg. Bartók arrived at a vital and varied style, rhythmically animated, in which diatonic and chromatic elements are juxtaposed without incompatibility. Within these two creative decades, Bartók composed two concerti for piano and orchestra and one for violin; the *Cantata Profana* (1930), his only large-scale choral work; the *Music for Strings, Percussion, and Celesta* (1936) and other orchestral works; and several important chamber scores, including the *Sonata for Two Pianos and Percussion* (1937). The same period saw Bartók expanding his activities as a concert pianist, playing in most of the countries of western Europe, the United States, and the Soviet Union.

U.S. career. As Nazi Germany extended its sphere of influence in the late 1930s and Hungary appeared in imminent danger of capitulation, Bartók found it impossible to remain there. After a second concert tour of the

United States in 1940, he emigrated there later the same year. An appointment as research assistant in music at Columbia University enabled him to continue working with folk music, transcribing and editing for publication a collection of Serbo-Croatian women's songs, a part of a much larger recorded collection of Yugoslav folk music. With his wife, the pianist Ditta Pászty, he was able to give a few concerts. His health, however, was never very strong and had begun to deteriorate even before his arrival in America.

Bartók's last years were marked by the ravages of leukemia, which often prevented him from teaching, lecturing, or performing. Nonetheless, he was able to compose the *Concerto for Orchestra* (1943), the *Sonata for Solo Violin* (1944), and all but the last measures of the *Third Piano Concerto* (1945). When he died, his last composition, a *Concerto for Viola and Orchestra*, was left an uncompleted mass of sketches.

Assessment. The significance of Béla Bartók lies in four major areas of music—composition, performance, pedagogy, and ethnomusicology. As a composer of a stature equaled by few in the first half of the 20th century, he fused the essence of Hungarian and related folk music with traditional music to achieve a style that was at once nationalistic and deeply personal. As a pianist he gave concerts in Europe and the United States, disseminating the newer Hungarian music. As a teacher he helped train generations of pianists, both Hungarian and foreign. And as an ethnomusicologist he was one of the first to examine folk music with attention to its historical and sociological implications. He helped to lay the foundations for the study of comparative musical folklore in Hungary and published several important book-length studies of Hungarian and Romanian folk music. Though his music was infrequently performed outside Hungary during his lifetime, many of his compositions, including the string quartets and the *Concerto for Orchestra*, later entered the standard concert repertory. Bartók's compositions within a quarter century after his death were ranked among the classics of Western music. (H.Ss.)

MAJOR WORKS. *Orchestral music.* *Kossuth*, symphonic poem (1903); *Suite No. 1*, op. 3, for large orchestra (1905); *Suite No. 2*, op. 4, for small orchestra (1905–07); *Dance Suite* (1923); *Music for Strings, Percussion, and Celesta* (1936); *Divergimento*, for string orchestra (1939); *Concerto for Orchestra* (1943). *Concerti: Violin Concerto No. 1* (1907–08), *No. 2* (1937–38); *Piano Concerto No. 1* (1926), *No. 2* (1930–31), *No. 3* (1945); *Viola Concerto* (unfinished, but completed by Tibor Serly, 1945).

Chamber music. String quartets: *No. 1*, op. 7 (1908); *No. 2*, op. 17 (1915–17); *No. 3* (1927); *No. 4* (1928); *No. 5* (1934); *No. 6* (1939). Miscellaneous: *Piano Quintet* (1903–04); *Sonatas for Violin and Piano No. 1* (1921), *No. 2* (1922); *Rhapsodies for Violin and Piano No. 1* and *2* (1928); *Forty-four Duos*, for two violins (1931); *Sonata for Two Pianos and Percussion* (1937); transcribed as *Concerto for Two Pianos and Orchestra*, 1940; *Contrasts*, for violin, clarinet, and piano (1938); *Sonata for Solo Violin* (1944). Piano solos: *Rhapsody*, op. 1 (1904; also arranged for piano and orchestra and for two pianos); *Fourteen Bagatelles*, op. 6 (1908); *For Children* (1908–09); *Allegro barbaro* (1911); *Sonatina* (1915); *Suite*, op. 14 (1916); *Sonata* (1926); *Out of Doors*, suite (1926); *Mikrokosmos*, 153 progressive pieces for piano (1926–39).

Vocal music. Stage works: *Duke Bluebeard's Castle*, op. 11, an opera, libretto by Béla Balázs (Budapest, 1918); *The Wooden Prince*, op. 13, ballet, libretto by Béla Balázs (Budapest, 1917); *The Miraculous Mandarin*, op. 19, pantomime, libretto by Menyhért Lengyel (Cologne, 1926). *Cantata Profana: The Nine Enchanted Stags*, for double mixed chorus, tenor and baritone soloists, and orchestra (1930). Songs: A large number of settings of Hungarian and other folk songs, including *Five Village Scenes*, for voice and piano (1924).

BIBLIOGRAPHY. *Béla Bartók Essays*, compiled and ed. by Benjamin Suchoff (1976), collects the composer's writings, especially on folk music. Bartók's letters have been collected and edited by János Demény in several publications: *Bartók Béla: levelek, fényképek, kéziratok, kották* (1948), *Bartók Béla levelei, az utolsó két év gyűjtése* (1951), *Bartók Béla levelei* (1955), *Ausgewählte Briefe* (1960), and *Béla Bartók Letters* (1971). Biographical and critical works include Paul Griffiths, *Bartók* (1984); Malcolm Gillies, *Bartók Remembered* (1990), a selection by those who knew the composer personally; Halsey Stevens, *The Life and Music of Béla Bartók*, 3rd ed. prepared by Malcolm Gillies (1993), with a catalog of compositions and an extensive bibliography; Malcolm Gillies (ed.), *The Bartók Companion* (1993); Peter Laki (ed.), *Bartók and His World* (1995); and László Somfai, *Béla Bartók: Composition, Concepts, and Autograph Sources* (1996).

Bartold, Vasily Vladimirovich, also called WILHELM BARTHOLD (b. Nov. 15 [Nov. 3, Old Style] 1869, St. Petersburg, Russia—d. Aug. 19, 1930, Leningrad [St. Petersburg]), Russian anthropologist who made valuable contributions to the study of the social and cultural history of Islām and of the Tajik Iranians and literate Turkic peoples of Central Asia.

Bartold joined the faculty of the University of St. Petersburg in 1901 and for the rest of his life devoted himself to teaching and research, interrupted by frequent, extended field trips. The interaction of the individual with society was of particular interest to him, and he also worked to refine the theory of his colleague Vasily Radlov on the formation of Turkic states through usurpation of popular authority by a powerful individual. His major works appeared in nine volumes; translations include *Four Studies on the History of Central Asia*, 3 vol. (1956–62), and *Turkestan Down to the Mongol Invasion* (1928). Bartold contributed many articles to *The Encyclopaedia of Islam*; especially noteworthy are his portraits of peoples of the Caucasus and Asia, including the Kalmyks, Kazaks, and Kyrgyz.

Bartoli, Matteo Giulio (b. Nov. 22, 1873, Albona d'Istria, Austria-Hungary [now Labin, Croatia]—d. Jan. 23, 1946, Turin, Italy), linguist who emphasized the geographic spread of linguistic changes and their interpretation in terms of history and culture.

Having obtained his doctorate at the University of Vienna, Bartoli in 1907 became professor at the University of Turin, where he remained until his retirement. In an important early study, *Das Dalmatische* (1906; "Dalmatian"), he documented and analyzed the now-extinct Romance dialect of the Adriatic island of Veglia (Krk, Yugos.). He later advanced his theories about language in *Introduzione alla neolinguistica* (1925; "Introduction to Neolinguistics") and *Saggi di linguistica spaziale* (1945; "Essays on Areal Linguistics"). In his view, there is a direct, causal connection between linguistic expansion and distribution, on the one hand, and linguistic change and its order of occurrence, on the other. Though his chief interest was in Romance languages, he also addressed himself to Proto-Indo-European languages.

Bartolomeo, Fra, also called BACCIO DELLA PORTA (b. March 28, 1472, Florence [Italy]—d. Oct. 31, 1517, Florence), painter who was a prominent exponent in early 16th-century Florence of the High Renaissance style.

He served as an apprentice in the workshop of Cosimo Rosselli and then formed a workshop with the painter Mariotto Albertinelli. His early works, such as the "Annunciation" (1497; Volterra Cathedral), were influenced by the balanced compositions of the Umbrian painter Perugino and by the sfumato (smoky effect of light and shade) of Leonardo da Vinci. Saddened by the death of the Florentine Dominican religious reformer Girolamo Savonarola, Bartolomeo joined the Domini-

"God the Father with SS. Catherine of Siena and Mary Magdalene," painting by Fra Bartolomeo, 1509; in the Pinacoteca Civica, Lucca, Italy

SCALA/Art Resource

can order in 1500 and gave up painting. He began painting again in 1504, and his "Vision of St. Bernard" (completed 1507; Accademia, Florence) shows him achieving the transition from the subtle grace of late Quattrocento painting to the monumentality of the High Renaissance style.

In 1508 Bartolomeo visited Venice, where he assimilated the Venetian painters' use of richer colour harmonies. Back in Florence soon afterward, he painted a number of calm and simple religious pictures in which monumental figures are grouped in balanced compositions and portayed with a dense and somewhat shadowy atmospheric treatment. Among such works are his "God the Father with SS. Catherine of Siena and Mary Magdalene" (1509; Pinacoteca Civica, Lucca) and the "Mystic Marriage of St. Catherine" (1512; Uffizi, Florence).

Bartolomeo visited Rome in 1514, where he saw Raphael's mature work and Michelangelo's frescoes on the ceiling of the Sistine Chapel. In response Bartolomeo's art took on a greater power of dramatic expression, as in the "Madonna della Misericordia" (1515; Pinacoteca Civica) and the "Pietà" (c. 1515; Pitti Palace, Florence). Despite Bartolomeo's assimilation of the progressive currents of his time, his art is restrained, conservative, and somewhat severe, and he painted religious subjects almost exclusively.

Bartolozzi, Francesco (b. Sept. 21, 1727, Florence [Italy]—d. March 7, 1815, Lisbon, Port.), Florentine engraver in the service of George III of England.

Bartolozzi, the son of a goldsmith, studied painting in Florence, trained as an engraver in Venice, and began his career in Rome. In 1764 he was invited to London, where he remained for 40 years. For his patron, George III, he executed numerous engravings, including those after Hans Holbein's drawings at Windsor. He also made many engravings of paintings by Italian masters and by his friends, the fashionable painters Giovanni Cipriani and Angelica Kauffmann.

Bartolozzi was not the inventor of the red-chalk method of engraving, but he made it the fashion. In 1802 he was invited to Lisbon as director of the National Academy. His son, Gaetano Stephano (1757–1821), also an engraver, was the father of Madame Vestris.

Bartolus OF SAXOFERRATO, Italian BARTOLO DA SASSOFERRATO (b. 1313/14, Sassoferrato, Papal States [Italy]—d. 1357, Perugia [Italy]), lawyer, law teacher at Perugia, and chief among the post-glossators, or commentators, a group of north Italian jurists who, from the mid-14th century, wrote on the civil (Roman) law. Their predecessors, the glossators, had worked at Bologna from about 1125.

Bartolus studied law at the universities of Perugia and Bologna and held the chair of law at Perugia from 1343 onward. He and his colleagues used the Corpus Juris Civilis of the 6th-century Byzantine emperor Justinian I and the work of the glossators thereon, together with Roman civil law, as a foundation from which to derive broad legal principles that could be of practical use in 14th-century Europe. Through this process he wrote several extremely influential legal doctrines, particularly those on the governmental authority of city-states and the rights of the individuals and corporate bodies within them. These and other of his principles became the common law of Italy and were also recognized as law in Spain, Portugal, and Germany. Bartolus' commentaries on what came to be called the Code of Justinian were sometimes accorded an authority equal to that of the code itself.

Barton, Clara, in full CLARISSA HARLOWE BARTON (b. Dec. 25, 1821, Oxford, Mass., U.S.—d. April 12, 1912, Glen Echo, Md.), founder of the American Red Cross, known as the "angel of the battlefield."

After 18 years as a schoolteacher in Massachusetts and New Jersey, Barton moved to Washington, D.C., and became a clerk in the U.S. Patent Office. At the outbreak of the Civil War she organized an agency to obtain and distribute supplies for the relief of wounded

Clara Barton, 1860s

By courtesy of the American National Red Cross

soldiers. In 1865, at the request of President Abraham Lincoln, she set up a bureau of records to aid in the search for missing men. While she was in Europe for a rest (1869–70), the Franco-German War broke out, and she again distributed relief supplies to war victims.

In Europe she became associated with the International Red Cross, and in 1881 she established the American National Red Cross. In 1882 she succeeded in having the United States sign the Geneva Agreement on the treatment of the sick, wounded, and dead in battle and the handling of prisoners of war. She wrote the American amendment to the constitution of the Red Cross, which provides for the distribution of relief not only in war but also in times of such calamities as famines, floods, earthquakes, cyclones, and pestilence.

Barton conducted relief for sufferers from disasters in the 1880s and '90s and served in Cuba during the Spanish-American War (1898). She served as president of the American Red Cross until 1904, when, under increasing criticism of her arbitrary leadership, she stepped down to avoid further dissension within the organization. She wrote several books, including *History of the Red Cross*

(1882) and *The Red Cross in Peace and War* (1899).

BIBLIOGRAPHY. Elizabeth Brown Pryor, *Clara Barton. Professional Angel* (1987), is a biography based on her letters and diaries. Stephen B. Oates, *A Woman of Valor: Clara Barton and the Civil War* (1994), focuses on this specific period of her life.

Barton, Derek H.R., in full DEREK HAROLD RICHARD BARTON (b. Sept. 8, 1918, Gravesend, Kent, Eng.), British joint recipient, with Odd Hassel of Norway, of the 1969 Nobel Prize for Chemistry for research that helped establish conformational analysis (the study of the three-dimensional geometric structure of complex molecules) as an essential part of organic chemistry.

In 1945 Barton joined the staff of the Imperial College of Science and Technology, London, first as an assistant lecturer and later as a research fellow. While serving as a visiting professor at Harvard University in 1949–50, he began work that led to his seminal publication (1950) on conformational analysis, which immediately caught the attention of the scientific community and revolutionized organic chemistry.

A faculty member of Birkbeck College, University of London, from 1950, Barton served as professor of chemistry at the University of Glasgow (1955–57) and then became professor of organic chemistry at Imperial College. In 1960 he discovered the Barton reaction, a process that led to an easier means of synthesizing the hormone aldosterone.

Barton, Sir Edmund (b. Jan. 18, 1849, Sydney, New South Wales [now in Australia]—d. Jan. 7, 1920, Medlow, N.S.W., Australia), statesman who guided the Australian federation movement to a successful conclusion and became the first prime minister of the resulting commonwealth in 1901.

Barton in 1879 entered the New South Wales Legislative Assembly, where he served as speaker (1883–87); he was attorney general in 1889 and 1891–93. In 1891 he assumed leadership of the federation movement and, in the federal convention of that year, helped shape the draft that became the foundation for the eventual commonwealth constitution. The constitution bill passed the New South Wales assembly in 1893, and for the next four years Barton campaigned vigorously for its approval by the public. He led the federal convention of 1897–98 that drafted the final commonwealth constitution bill.

Barton went to England in 1900 to guide the new constitution through Parliament, and he returned to Australia to become prime minister later that year. (He was knighted in 1902.) Never thoroughly at home in the partisan atmosphere of the new Australian Parliament, he resigned his ministry in 1903 and became a senior judge on the High Court of Australia, serving until 1920.

Barton, Elizabeth, byname NUN OF KENT, or HOLY MAID OF KENT (b. c. 1506, Kent, Eng.—d. April 21, 1534, London), English ecstatic whose outspoken prophecies aroused public opinion over the matrimonial policy of King Henry VIII and led to her execution.

A domestic servant on the estate of William Warham, archbishop of Canterbury, she fell ill and about 1525 began to experience trances and to utter prophecies. Her fame spread, gaining for her a group of devotees, both clerical and lay. But her prophecies grew less mystical and more precise, and she began to threaten Henry VIII with dire consequences if he did not drop the projected annulment of his marriage to Catherine of Aragon and abandon Anne Boleyn. On one occasion she admonished the king in person.

After Henry's marriage to Anne, Elizabeth Barton's utterances approached the treasonable, and the new archbishop of Canterbury, Thomas Cranmer, began an investigation. Arrested and examined, she finally confessed to having feigned her trances and pretended her inspiration. She was condemned by Parliament and executed at Tyburn, outside London. It is not certain, however, that her confession—although extracted without torture—was the result of anything but confusion and fear, for she had no education and little intellect. If she was more a hysteric than a saint, it is probable that she was, in the main, sincere, more deluded than deluding.

Barton, Frances: see Abington, Fanny.

bartonellosis, also called CARRIÓN'S DISEASE, rickettsial infection limited to South America, caused by the bacterium *Bartonella bacilliformis* of the order Rickettsiales. Bartonellosis is characterized by two distinctive clinical stages: Oroya fever, an acute febrile anemia of rapid onset, bone and joint pains, and a high mortality if untreated, and verruga peruana, a more benign skin eruption characterized by reddish papules and nodules, which usually follows the Oroya fever but may also occur in individuals who have not exhibited previous symptoms. The skin lesions are thought to be an expression of developing immunity in the affected persons; reinfection is extremely rare.

The disease is transmitted to humans by the night-biting sand fly of the genus *Phlebotomus*, which propagates in the Andes Mountains in parts of Peru, Ecuador, and Colombia. The disease responds well to certain antibiotics. Control measures are directed principally at the insect carrier, with the use of insecticides and insect repellents.

Bartonian Stage, the third of four divisions (in ascending order) of the Eocene Series, representing all those rocks deposited worldwide during the Bartonian Age (43.6 to 40 million years ago). Together with the underlying Lutetian Stage, it constitutes the Middle Eocene; the Bartonian is overlain by the Priabonian Stage.

The stage's name is derived from the Barton Beds found between Highcliffe and Milford-on-Sea in Hampshire, England, which traditionally served as the stratotype section. The Barton Beds are a sequence of clays and sands that are rich in the greenish, iron-bearing mineral glauconite. The Bartonian Stage is commonly defined by the biozones of the foraminiferans *Orbulinoides beckmanni* and *Truncorotaloides rohri*.

Bartow, city, seat (1861) of Polk county, central Florida, U.S. It lies near the Peace River and Lake Hancock, 12 miles (19 km) southeast of Lakeland. In 1851 the Reading Blount family built a stockade community known as Fort Blount on the site of an earlier settlement (Peas Creek). It was incorporated as a municipality (1867) and named for Francis S. Bartow, a Confederate general. It was incorporated as a town in 1882 and became a city in 1893. Phosphate mining, citrus cultivation, and truck farming are now the city's economic mainstays. The nearby Bone Valley Phosphate Museum exhibits fossil remains and traces the history of the phosphate industry. Pop. (1992 est.) 14,898.

Bartram, John (b. March 23, 1699, near Darby, Pa. [U.S.]—d. Sept. 22, 1777, Kingsessing, Pa., U.S.), naturalist and explorer considered the "father of American botany."

Largely self-educated, Bartram was a friend of Benjamin Franklin and an original member of the American Philosophical Society. He was botanist for the American colonies to King George III.

Bartram was the first North American experimenter to hybridize flowering plants, and he established near Philadelphia a botanical gar-

den that became internationally famous. He collected and exported seeds and plants that were in great demand abroad and thus established friendships with European botanists, among them Carolus Linnaeus, who esteemed him as a great "natural botanist."

Bartram made scientific forays into the Alleghenies, Carolinas, and other areas of North America, and in 1743 he was commissioned by the British crown to visit the Indian tribes of the League of Six Nations and to explore the wilderness north to Lake Ontario in Canada. In 1765–66 he explored extensively in Florida with his son William, also a naturalist, whose *Travels* (1791) greatly influenced English Romanticism.

Baruch, Apocalypse of, in full THE BOOK OF THE APOCALYPSE OF BARUCH THE SON OF NERIAH, a pseudepigraphal work (not in any canon of scripture), whose primary theme is whether or not God's relationship with man is just. The book is also called *The Syriac Apocalypse of Baruch* because it was preserved only in the 6th-century Syriac Vulgate. It was originally composed in Hebrew and ascribed to Baruch, a popular legendary figure among Hellenistic Jews, who was secretary to Jeremiah, the biblical prophet.

Passages in the book indicate that it was written after the destruction of Jerusalem in AD 70, probably around 100. Textual conflicts suggest possible multiple authorship but may be due to inaccurate translations and to the use of traditional materials from different historical periods that are not easily harmonized.

The question of divine justice that preoccupied the Jews after the fall of Jerusalem is discussed in the *Apocalypse* in a series of prayers and visions. The apparently unjust sufferings of the righteous are explained as God's method of sanctifying his chosen people.

Baruch, Bernard, in full BERNARD MANNES BARUCH (b. Aug. 19, 1870, Camden, S.C., U.S.—d. June 20, 1965, New York, N.Y.), American financier who was an adviser to U.S. presidents.

After graduating from the College of the City of New York in 1889, Baruch worked as an office boy in a linen business and later in Wall Street brokerage houses. Over the years he amassed a fortune as a stock market speculator. In 1916 he was appointed by President Woodrow Wilson to the Advisory Commission of the Council of National Defense, and during World War I he became chairman of the War Industries Board. In 1919 he was a member of the Supreme Economic Council at the Versailles Peace Conference and was also a personal adviser to President Wilson on the terms of peace. As an expert in wartime economic mobilization, Baruch was employed as an adviser by President Franklin D. Roosevelt during World War II, although he did not hold an administrative position. After the war Baruch played an instrumental role in formulating policy at the United Nations regarding the international control of atomic energy. The designation of "elder statesman" was applied to him perhaps more often than to any other American of his time.

Baruch, Book of, ancient text purportedly written by Baruch, secretary and friend of Jeremiah, the Old Testament prophet. The text is still extant in Greek and in several translations from Greek into Latin, Syriac, Coptic, Ethiopic, and other languages. The Book of Baruch is apocryphal to the Hebrew and Protestant canons but was incorporated in the Septuagint (*q.v.*; Greek version of the Hebrew Bible) and was included in the Old Testament for Roman Catholics.

The work is a compilation of several authors and is the only work among the apocrypha that was consciously modeled after the prophetic writings of the Old Testament.

A brief introduction reports that Baruch wrote the book five years after the destruction of Jerusalem by Babylonia in 586 BC. A long prayer (1:15–3:8) is a national confession of sins similar to the lamentation in chapter nine of the Old Testament Book of Daniel. The original Hebrew text perhaps dates from the late 2nd century BC. In the next section, a poem identifies God with universal wisdom and names the Judaic Law as God's gift of wisdom to men (3:9–4:4). In poems of lamentation and consolation that follow (4:5–5:9), Jerusalem is personified as a widow who weeps for her lost children, and God speaks words of comfort to the Jews. These latter poems may date from the 1st century BC.

Barūjird (Iran): see Borūjerd.

Bārūni, also spelled BARAUNI, or BERUNI, town, north-central Bihār state, northeastern India. It lies north of the Ganges River and is part of the Begusarai urban agglomeration. Formerly called Jhuldabhaj, it merged with Phulwaria township in 1961. It has major highway, rail, and ferry connections and is an agricultural trade centre. Bārūni is chiefly an industrial complex, with a petroleum refinery and a thermal power plant. The town is the site of a college affiliated with Bhāgalpur University. Pop. (1991 prelim.) 60,668.

Baruta, city, northwestern Miranda estado ("state"), northern Venezuela, in the central highlands. Formerly a commercial centre in a fertile agricultural area producing coffee, cacao, and sugarcane, the city has become a residential suburb in the Caracas metropolitan area. An expressway links Baruta to Caracas (north-northeast). Pop. (1990 est.) 279,614.

Barwāni, city, southwestern Madhya Pradesh state, west-central India. It is situated just south of the Narmada River, about 70 miles (110 km) southwest of Indore. A trade centre for agricultural produce and timber, it is heavily engaged in cotton ginning. Founded in about 1650, the city served as capital of the former Barwāni princely state, which merged with Madhya Bhārat in 1948. Nearby lies Chulgiri Hill, a pilgrimage site of special sanctity to the Jains; on the face of the hill is carved a gigantic figure of the Jaina saint Bāhubali (Gommātesvara). Barwāni has a hospital and a government college affiliated with Vikram University. Pop. (1991 prelim.) 33,669.

Bary, Heinrich Anton de (b. Jan. 26, 1831, Frankfurt am Main [Germany]—d. Jan. 19, 1888, Strassburg, Ger. [now Strasbourg, Fr.]), German botanist whose researches into the roles of fungi and other agents in causing plant diseases earned him distinction as a founder of modern mycology and plant pathology.

A professor of botany at the universities of Freiburg im Breisgau (1855–66), Halle (1867–72), and Strassburg (1872–88), de Bary determined the life cycles of many fungi, for which he developed a classification that has been retained in large part by modern mycologists. Among the first to study host-parasite interactions, he demonstrated ways in which fungi penetrate host tissues.

In his book *Untersuchungen über die Brandpilze* (1853; "Researches Concerning Fungal Blights"), he correctly asserted that fungi associated with rust and smut diseases of plants are the cause, rather than the effect, of these diseases. In 1865 he proved that the life cycle of wheat rust involves two hosts, wheat and barberry. He was the first to show (1866) that lichens consist of a fungus and an alga in intimate association; he coined the term symbiosis in 1879 to mean an internal, mutually beneficial partnership between two organisms.

De Bary also did important research on slime molds and sexual modes of reproduction in algae, and he wrote a comparative anatomy of phanerogams and ferns.

Barye, Antoine-Louis (b. Sept. 24, 1796, Paris, Fr.—d. June 29, 1875, Paris), prolific French sculptor, primarily of animals, known as the father of the Animalier school.

The son of a jeweler, Barye was apprenticed to an engraver of military equipment at age 13; after serving in the army, he worked for a time in the jewelry trade. In about 1817 he began to sculpt while working in the studio of the sculptor François Bosio. He was also influenced by the Romantic paintings of Théodore Géricault. From 1823 to 1831 he worked with Fauconnier, a goldsmith.

Barye's talent for rendering dynamic tension and exact anatomical detail is especially evident in his most famous bronzes, those of wild animals struggling with or devouring their prey. He also produced many figures and groups of domestic animals.

Barye moved in and out of the dominant artistic circle during his turbulent career. He exhibited his bronzes at the Salons of 1827 and 1831, receiving a second prize for his "Lion Devouring a Gavia." In 1834 he began to have conflicts with the academic art establishment and did not exhibit again until 1850.

Barylambda, extinct genus of unusual and aberrant mammals found as fossils in deposits in North America in the late Paleocene epoch (63.5 to 57.8 million years ago). *Barylambda* was a relatively large animal, 2.5 m (about 8 feet) long, with an unusually massive body and legs. The very thick tail possibly was used as a support, allowing the animal to raise itself on its hind legs. The skull was relatively small and short. The feet were short and broad, with

Barylambda faberi, from Colorado

By courtesy of the American Museum of Natural History, New York

five digits. *Barylambda* retained clavicles, or collarbones, a feature that is considered primitive in hoofed mammals. It is likely that *Barylambda* fed on plants that were rather soft and easily chewed. It was among the largest animals of its time.

baryon, any member of one of two classes of hadrons (particles built from quarks and thus experiencing the strong nuclear force). Baryons are heavy subatomic particles that are made up of three quarks. Both protons and neutrons, as well as other particles, are baryons. (The other class of hadronic particle is built from a quark and an antiquark and is called a meson.)

Baryons are characterized by a baryon number, *B*, of 1. Their antiparticles, called antibaryons, have a baryon number of -1 . An atom containing, for example, one proton and one neutron (each with a baryon number of 1) has a baryon number of 2. In addition to their differences in composition, baryons and mesons can be distinguished from one another by spin: the three quarks that make up a baryon can only produce half-integer values, while meson spins always add up to integer values.

Baryshnikov, Mikhail (Nikolayevich) (b. Jan. 28, 1948, Riga, Latvia, U.S.S.R.), Soviet-born American ballet dancer who was the preeminent male classical dancer of the 1970s and '80s. He subsequently became a noted dance director.

The son of Russian parents in Latvia, Baryshnikov entered Riga's opera ballet school at age 12. The success that he achieved there con-

vinced him to devote himself to dancing. In 1963 he was admitted to the Vaganova ballet school (the training school for the Kirov Ballet in Leningrad [St. Petersburg]), where he was instructed by Aleksandr Pushkin. In 1966 he joined the Kirov Ballet as a soloist without having to serve the customary apprenticeship as a member of the corps de ballet. As the Kirov Ballet's *premier danseur noble*, Baryshnikov appeared in the leading roles in *Gorinka* (1968) and *Vestris* (1969), two original ballets that had been especially choreographed for him.

Baryshnikov was extremely popular with Soviet audiences, but he began to chafe at the official restrictions that were placed upon him as an artist, particularly the prohibition on his performance of contemporary foreign ballets. While on a dance tour in Toronto in June 1974, Baryshnikov defected and was granted asylum by the Canadian government. Soon thereafter he began a series of highly successful appearances before North American audiences. As a dancer, his great physical prowess and unsurpassed leaping ability enabled him to perform the most difficult combinations of steps with remarkable elegance of line.

Baryshnikov joined the American Ballet Theatre (ABT) in 1974 and danced with that company for four years, during which time he rechoreographed the Russian classics *The Nutcracker* (in 1976) and *Don Quixote* (in 1978). He danced with the New York City Ballet under George Balanchine in 1978–79, but from 1980 to 1989 he returned to the ABT as that company's artistic director.

In addition to his ballet career, Baryshnikov played a leading role as dancer and actor in the motion pictures *The Turning Point* (1977), *White Nights* (1985), *That's Dancing!* (1985), and *Dancers* (1987), played a dramatic role in the Franz Kafka play *Metamorphosis* (1989), and made many appearances on television.

baryton, bowed, stringed musical instrument that enjoyed a certain vogue in the 18th century. It was related to the viol family, was about the size of a cello, and had six melody strings and a fretted fingerboard. Up to 40 sympathetically vibrating strings, some

German baryton; in the Museum of Fine Arts, Boston

Leslie Lindsay Mason Collection of Musical Instruments (formerly the Galpin Collection), Museum of Fine Arts, Boston

of which were plucked with the left-hand thumb, ran behind the wide neck. Joseph Haydn wrote 175 *baryton* compositions for his patron, Prince Miklós Esterházy, a skilled *baryton* player.

Barzani, Mustafa al- (b. 1904, Barzan, Iraq—d. March 2, 1979, Washington, D.C., U.S.), Kurdish military leader who for 50 years strove to create an independent nation for the millions of Kurds living on the borders of Iran, Iraq, and the Soviet Union.

The son of a landlord, Barzani succeeded his elder brother, Sheikh Ahmed, who led the Kurdish national struggle from World War I until the late 1930s. In 1946 Barzani emerged as president of the short-lived Kurdish Mahabad Republic, which had been established with Soviet aid in northwestern Iran. After the Soviet forces withdrew in 1947, the republic collapsed, and Barzani took refuge in Soviet Azerbaijan, where he remained until he was allowed to return to Iraq after that country's 1958 revolution. Barzani rejected the Iraqi government's subsequent offer of autonomy for the Kurdish area in northern Iraq, and in 1960 he escaped to the mountains and started a guerrilla war against the Iraqi forces. After 10 years of intermittent fighting, a cease-fire agreement was reached followed by a general amnesty for the insurgent Kurds, and in 1974 a law defining the Kurdish autonomous region was promulgated by Iraq. Barzani found this compromise unacceptable and ordered his Pesh Merga ("Forward to Death") Kurdish forces to resume fighting, this time with considerable support from Iran. When Iranian support ended in 1975, the Kurdish guerrillas were overrun by the Iraqi forces. Barzani took up residence in Tehrân but then requested asylum in the United States, where he died.

Barzaz Breiz, originally BARZAS-BREIZ; CHANTS POPULAIRES DE LA BRETAGNE ("Breton Bardic Poems: Popular Songs of Brittany"), collection of folk songs and ballads purported to be survivals from ancient Breton folklore. The collection was made, supposedly from the oral literature of Breton peasants, by Théodore Hersart de La Villemarqué and was published in 1839. In the 1870s it was demonstrated that *Barzaz Breiz* was not an anthology of Breton folk poetry but rather a mixture of old poems, chiefly love songs and ballads, that were rearranged by the editor or others; modern poems made to look medieval; and spurious poems about such romance figures as Merlin and Nominoë. Review of Villemarqué's papers in the 1980s, however, showed that some of the poems were authentic.

Barzaz Breiz was extremely influential: the historical poems exalting the Bretons' traditional struggle against oppression revived Breton pride in their language and heritage; it also led to the reawakening of Breton writers and stimulated further study of Breton folklore.

Barzizza, Gasparino da, original name GASPARINO DI PIETROBUONO (b. 1360?, Barzizza, near Bergamo, Italy—d. 1431, Milan), teacher noted for his ability to relate classical civilization to the Italy of his day.

Barzizza studied grammar and rhetoric at Pavia and stayed there to teach. He moved to Venice and then to Padua, where he won fame as a teacher of science and as a humanist. He taught later at Ferrara and, from 1421, at Milan. Barzizza was known for his scholarship as well as for his teaching. His writings included works in epistolography, oratory, rhetoric, and literary and historical commentary, and he compiled a manual of Latin orthography. His *Book of Letters* (1470) was the first book produced by a printing press in France. His son Guimforte (c. 1406–63) became a noted teacher and author.

Barzun, Jacques (b. Nov. 30, 1907, Créteil, France), French-born American teacher, historian, and author who influenced higher education in the United States by his insistence that undergraduates avoid early specialization and instead be given broad instruction in the humanities.

Barzun moved to the United States in 1920. He became a lecturer in history at Columbia University in 1927, obtaining his Ph.D. from there in 1932. Remaining at Columbia, he rose to dean of faculties and provost in 1958 and became emeritus in 1967. He assisted in the development of a two-year course for the reading and discussion of great books.

His works on education include *Teacher in America* (1945), essays; *The House of Intellect* (1959), a work that indicts the American educational system for producing counterfeit intellectuals; and *The American University: How It Runs, Where It Is Going* (1969). A related work is *Science: The Glorious Entertainment* (1964), in which he criticizes what he considers to be an overestimation of scientific thought. Noteworthy among his books on the arts are *Berlioz and the Romantic Century*, 2 vol. (1950; 3rd ed. 1969), *Pleasures of Music* (1951; reissued 1977), *The Energies of Art: Studies of Authors, Classic and Modern* (1956), *Classic, Romantic, and Modern* (1961), *On Writing, Editing, and Publishing* (1971), and *The Use and Abuse of Art* (1974). *Simple and Direct* (1975) is a rhetoric for writers.

bas-relief, sculptural relief in which the projection from the surrounding surface is slight. See relief.

Bas-Rhin, département, Alsace région, on the northeastern frontier of France. It extends along the left (west) bank of the Rhine River, which separates it from Germany. Formed from the northern half of Alsace, the area became part of France in the 17th century, but as a part of Alsace-Lorraine it was lost to Germany in 1871–1919 and 1940–44. It includes the northern part of the plain of Alsace in the east and flanking highlands to the west. The Vosges Mountains rise in the southwest corner to 3,600 feet (1,100 m).

The eastern plain has a mild, sheltered climate. Where covered with loess, the terraces are exceptionally fertile and highly cultivated for corn (maize), sugar beets, fodder, and hops. Elsewhere on the plain are nonarable wooded tracts, the largest being Haguenau Forest.

Along the river valleys are low-lying belts of damp alluvium that are rich meadowlands. At the foot of the highlands to the west is a rich zone of small towns and villages surrounded by orchards and celebrated vineyards.

Strasbourg, its old town originally sited on the Ill River just above the latter's confluence with the Rhine, is the principal city in the département. It is a terminal point for the Rhine-Rhône and Rhine-Marne canals. Strasbourg, a university and cathedral city, is the département's capital and also centre for an *arrondissement*, as are Erstein, Haguenau, Molsheim, Saverne, Sélestat, and Wissembourg. Area 1,836 square miles (4,755 square km). Pop. (1991 est.) 958,000.

basal metabolic rate (BMR), index of the general level of activity of an individual's body metabolism, determined by measuring his oxygen intake in the basal state—*i.e.*, during absolute rest, but not sleep, 14 to 18 hours after eating. The higher the amount of oxygen consumed in a certain time interval, the more active is the oxidative process of the body and the higher is the rate of body metabolism. The BMR has been used in measuring the general metabolic state during therapy. It was formerly widely used to assess thyroid function, since the thyroid hormones are prime regulators of tissue oxidation and metabolism; but, since the advent of radioactive-isotope tests

and thyroid-hormone studies, BMR measurements have fallen into disuse.

basalt, extrusive igneous (volcanic) rock that is low in silica content, dark in colour, and comparatively rich in iron and magnesium.

Some basalts are quite glassy (tachylytes), and many are very fine-grained and compact; it is more usual, however, for them to exhibit porphyritic structure, with larger crystals (phenocrysts) of olivine, augite, or feldspar in a finely crystalline matrix (groundmass). Olivine and augite are the most common porphyritic minerals in basalts; porphyritic plagioclase feldspars are also found. Basaltic lavas are frequently spongy or pumiceous; the steam cavities become filled with secondary minerals such as calcite, chlorite, and zeolites.

Basalts may be broadly classified on a chemical and petrographic basis into two main groups: the calc-alkali and the alkali basalts. Calc-alkali basaltic lavas are characterized by basic plagioclase with augite, pigeonite or hypersthene, and olivine as the dominant mafic (basic) minerals; basalts without olivine are also well-represented. Calc-alkali basalts, which contain from 45 percent to 52 percent silica, include the tholeiites (basalts with calcium-poor pyroxene). They predominate among the lavas of mountain belts; their flows may build enormous plateaus, as in the northwestern United States, the Deccan of India, and the Paraná Basin of South America. The active volcanoes of Mauna Loa and Kilauea in Hawaii erupt tholeiitic lavas.

Normal alkali basalt contains olivine and, commonly, a diopsidic or titaniferous augite. Alkali basalts predominate among the lavas of the ocean basins and are common among the basic lavas of the forelands and backlands of the mountain belts. In the Brito-Icelandic province the Tertiary lava flows of the Inner Hebrides, Antrim, and the Faroe Islands include great successions of both calc-alkali and alkali basalts.

Minerals of the feldspathoid group occur in a large number of basaltic rocks belonging to the alkali group; nepheline, analcime, and leucite are the commonest, but haüynite is occasionally present. If nepheline entirely replaces feldspar, the rock is known as nepheline-basalt; if the replacement is only partial the term nepheline-basanite is used. Similarly, there are analcime- and leucite-basalts and leucite-basanites. Most nepheline-basalts are fine-grained, very dark-coloured rocks and are of Tertiary age. They are fairly common in some parts of Germany and also occur in the United States (as in New Mexico) and in Libya, Turkey, and elsewhere. Leucite-basalts are found principally in Italy, Germany, eastern Africa, Australia, and, in the United States, in Montana, Wyoming, and Arizona.

basaltes ware, also called BLACK BASALTES, basaltes also spelled BASALT, hard black vitreous stoneware, named after the volcanic rock basalt and manufactured by Josiah Wedgwood at Etruria, Staffordshire, Eng., from about 1768. Wedgwood's black basaltes ware was an improvement on the stained earthenware known as "Egyptian black" made by other Staffordshire potters.

The fine-grained basaltes stoneware reflected Wedgwood's Neoclassicism: its dense, uniform surface, requiring no glaze, was polished to a dull gloss; the ornament was usually intricate and well-defined, often in complex geometric designs and either molded and applied or incised by turning on a lathe. Early productions included "bronze Etruscan" vases with faint gilding and copies of Greek vase painting in mat red and white encaustic enamels on the black ground. Classical relief medallions, cameos, and plaques were imitated in black basaltes, and even tea and coffee sets were made; small statues were fashioned as well as important life-size "library" busts of classical and modern philosophers and authors. Some

Wedgwood basalt ewer (one of a pair), Etruria, Staffordshire, Eng., c. 1775; in the Victoria and Albert Museum, London

basalt ware is essentially severe, with no decoration or added ornamentation.

Basanavičius, Jonas, Basanavičius also spelled BASSANOWICZ (b. Nov. 23, 1851, Ožkabaliai, Lithuania, Russian Empire—d. Feb. 16, 1927, Vilnius, Lithuania), physician, folklorist, and a leader of the Lithuanian national movement.

In 1873 Basanavičius went to Moscow to study history and archaeology but after a year changed to medicine. He was graduated in 1879 and spent most of the next 25 years practicing medicine in Bulgaria. He edited the first number of the important Lithuanian cultural and political magazine *Aušra* ("Dawn"), published 1883–86; it was printed in East Prussia and had to be smuggled into Lithuania because of the tsarist regime's ban on the printing of Lithuanian in the Latin alphabet. *Aušra* significantly influenced the development of the Lithuanian national movement.

From 1905 Basanavičius lived in Vilnius. Considered to be the moral president of the nation, he was chairman of the Great Assembly in Vilnius that in 1905 demanded autonomy for Lithuania; in 1917 he was president of the conference that elected him to the Lietuvos Taryba (Council of Lithuania), which on Feb. 16, 1918, proclaimed Lithuanian independence. Basanavičius' founding of the Lithuanian Scientific Society in 1907 was an outstanding contribution to Lithuanian learning. For 20 years he was president of the society, editor of its journal, and organizer of research in archaeology and folklore. His

Basanavičius, portrait by A. Varnas; in the Museum of History and Ethnography, Vilnius, Lithuania

By courtesy of the Istorijos Etnografijos Muziejus Vilnius, Lithuania

many publications are largely collections of Lithuanian folklore. He also wrote several studies expounding his hypothesis that the Lithuanians were descendants of the Thracophrygians.

basanite, extrusive igneous rock that contains calcium-rich plagioclase feldspar (usually labradorite or bytownite), feldspathoid (usually nepheline or leucite), olivine, and pyroxene (titanaugite). Basanite grades into tephrite, which contains no olivine.

Basanites and tephrites occur as gray to black rocks in sheets and flows. Places where basanites are found include Spain, Hungary, Italy, New Zealand, and the southwestern United States; tephrites are found in Germany, Italy, Portugal, Greenland, Uganda, and Colorado.

Basāsīrī, Arslān al-Muzaffar al- (d. Jan. 15, 1060, Saqy al-Furāt, near Kūfah, Iraq), Islāmic military leader.

Al-Basāsīrī was born a Turkish slave, and his activities were first mentioned about 1025. At the time, the weakened 'Abbāsīd caliphs at Baghdad, who represented Sunnite Islām, were under continuous pressure from the Fāṭimid caliphs of Egypt, representing the Shī'ite sect, and the insurgent Turks commanded by Toghrīl Beg. Al-Basāsīrī, a veteran of many battles in these struggles, joined with Arab tribesmen in 1058–59 to attempt to defeat the 'Abbāsīd caliph al-Qā'im in favour of the Fāṭimids. He was unsuccessful and was killed by the Turks in 1060. Toghrīl Beg seized Baghdad and reestablished under his control the supremacy of the 'Abbāsīds, and thereby favoured Sunnite over Shī'ite Islām.

Basava (fl. mid-12th century, South India), Hindu religious reformer, teacher, theologian, and administrator of the royal treasury of the Cālukya king Bijjala I (reigned 1156–67). Basava is the subject of the *Basava-Purāṇa*, one of the sacred texts of the Hindu Liṅgāyat sect (see Liṅgāyat). According to South Indian oral tradition, he was the actual founder of the Liṅgāyats, but study of Cālukya inscriptions indicates that rather than founding a new sect he in fact revived an existing one. His life and doctrines were recorded in the *Basava-Purāṇa*, written by Bhīma Kavī (14th century) in the Kannada language and based on an earlier Telugu version by Pāḷkuriki Sōmanātha.

Basava helped to spread the Liṅgāyat sect by teaching and by dispersing funds to Liṅgāyat guilds. It was his uncle, a prime minister, who first used his influence at court to secure an appointment for his erudite relative. Basava was appointed chief of the treasury, and for several years he and his faction enjoyed a great deal of popularity. But other factions at court were apparently resentful of his power and the flourishing of Liṅgāyat mendicants under his patronage. As a result of their accusations he fled the kingdom, dying soon thereafter. His poetry to Śiva as "lord of the meeting rivers" has earned him a place at the front rank of Kannada literature and the literature of Hindu devotion (bhakti) generally.

Basāvan (fl. 16th century, India), an outstanding Mughal painter, renowned as a superb colourist and as a sensitive observer of human nature. His name indicates that he may have been a member of the Ahīr, or cowherders' caste, in the region of modern Uttar Pradesh. He was most active between about 1580 and 1600, and his name appears on the margins of more than 100 paintings, most often as the designer, in collaboration with a second artist who applied the colour. A son, Manohar, became celebrated for his animal studies and portraits.

Abū-ul-Fazl 'Allāmī, the emperor Akbar's historiographer, wrote of Basāvan: "In designing and portrait painting and colouring and painting illusionistically . . . he became unrivalled in the world." Basāvan was noted for his exploration of space, for the depth and rich-

ness of his glowing colours, and above all for his keen powers of observation and sensitive, often moving, characterizations. Among the handful of miniatures that can be definitely attributed as solely his work is an illustration of the prose and verse work *Bahārestān*, by the Persian poet Jāmī, showing a mullah, or religious leader, rebuking a dervish for pride (Bodleian Library, Oxford); and an illustration of the *Dārāb-nāneh* ("Book of Darius") in the British Museum. Many of his compositions are found in the Jaipur *Razm-nāneh* (the Persian name for the Indian epic the *Mahābhārata*), the Patna *Tīmūr-nāneh* ("Book of Timur"), and the Victoria and Albert Museum's copy of Akbar's official history, the *Akbar-nāneh*.

Bascom, Florence (b. July 14, 1862, Williamstown, Mass., U.S.—d. June 18, 1945, Northampton, Mass.), educator and geological survey scientist who is considered to be the first American woman geologist.

Bascom earned bachelor's and master's degrees at the University of Wisconsin, and she later received the first Ph.D. awarded to a woman at Johns Hopkins University, Baltimore (1893). Bascom then taught at Ohio State University (1893–95) before going to Bryn Mawr College, where she founded the department of geology; under her direction, it gained a national reputation. From 1896 to 1908, she was also associate editor of the *American Geologist*.

In 1896 Bascom was named assistant geologist with the U.S. Geological Survey—the first woman ever to receive that appointment. Her work on the Mid-Atlantic Piedmont region led to the contributions for which she is best known—U.S. Geological Survey Folios on Philadelphia (1909), Trenton (1909), Elkton-Wilmington (1920), Quakertown-Doylestown (1931), and Honeybrook-Phoenixville (1938).

Bascom, William R., in full WILLIAM RUSSELL BASCOM (b. May 23, 1912, Princeton, Ill., U.S.—d. Sept. 11, 1981, San Francisco, Calif.), American anthropologist who served as chairman (1956–57) of the anthropology department and acting director of African studies (1953, 1957) at Northwestern University, Evanston, Ill.

Having held various official positions in British West Africa (1943–46), Bascom became a Fulbright research scholar (1950–51). In 1957 he was made professor and director of the Robert H. Lowie Museum at the University of California, Berkeley. A specialist in African folklore, Bascom, in his treatise on *Ifa Divination: Communication Between Gods and Men in West Africa* (1969), clarified the Yoruba divination system, which is orally transmitted by Ifa priests to apprentices. Other writings include *African Arts* (1967) and *The Yoruba of Southwestern Nigeria* (1969).

base, in chemistry, any substance that in water solution is slippery to the touch, tastes bitter, changes the colour of indicators (e.g., turns red litmus paper blue), reacts with acids to form salts, and promotes certain chemical reactions (base catalysis). Examples of bases are the hydroxides of the alkali and alkaline earth metals (sodium, calcium, etc.) and the water solutions of ammonia or its organic derivatives (amines). Such substances produce hydroxide ions (OH⁻) in water solutions (see Arrhenius theory).

Broader definitions of a base, to include substances that exhibit typical basic behaviour as pure compounds or when dissolved in solvents other than water, are given by the Brønsted-Lowry theory (*q.v.*) and the Lewis theory (*q.v.*). Compare acid.

base, also called RADIX, in mathematics, an arbitrarily chosen number in terms of which

any number can be expressed. *See* number system.

baseball, game played with bat, ball, and gloves between two teams of nine players each on a field on which four bases are laid out in a square. Teams alternate positions as batters and fielders, exchanging places when three members of the batting team are put out. As batters, players try to hit the ball out of reach of the fielding team and run a complete circuit around the bases to score a run. The team that scores the most runs in nine innings (times at bat) wins the game.

A brief treatment of baseball follows. For full treatment, *see* MACROPAEDIA: Baseball.

Baseball is traditionally considered to be the national pastime of the United States. It was once thought to have been invented in 1839 by Abner Doubleday in Cooperstown, N.Y., but it is more likely that baseball developed from an 18th-century English game called rounders (*q.v.*). The innovation that runners be tagged with the ball rather than hit with it was among the rules adopted by Alexander J. Cartwright and a group of New York City players who established the modern game. The tag rule made possible the introduction of a smaller hard ball and a larger, diamond-shaped field.

During the American Civil War (1861–65), baseball became popular among the troops, and following the war professional players appeared from the ranks of amateur associations. A National Association of Professional Base Ball Players was formed in 1871 and became the National League of Professional Baseball Clubs in 1876. A rival American League was later organized, comprising cities outside of the National League. Since 1903 the winning teams of each league have played a postseason championship, known as the World Series. Canadian teams were admitted to the major leagues in 1968 and 1976.

The National and American leagues remain the two components of professional baseball in the United States and Canada. In the early 20th century there were separate leagues for black athletes, the Negro leagues, that produced many fine players. Black players had briefly appeared in the short-lived American Association League during the 1880s, but it was only after Jackie Robinson began playing for the Brooklyn Dodgers in the 1940s that black players became integrated into major-league baseball.

A league reorganization took place in 1994, and since that time each league now has had Eastern, Central, and Western divisions (*see* American League; National League). The season extends from early April to early October and is concluded by divisional playoffs. Prior to the reorganization, teams who held the best records from the Eastern and Western divisions (there was no Central) faced each other in a series of games that decided who would win the league pennant (championship) and the right to contend in the World Series. The addition of the Central division has complicated the playoff structure; the three division leaders and a wild card team (the team with the best record that did not win a division) from each league now battle for the two World Series positions.

Baseball is also played in Japan and in Latin-American countries and has great popularity in these regions. Baseball was a demonstration sport at seven Olympic Games, beginning in 1912, before it became a full-medal Olympic sport at the 1992 Games. *See* Sporting Record: *Baseball*.

baseball, pocket-billiards game, named for the similarity in its scoring system to the American game played with bat and ball, in

which players attempt to score runs by pocketing 21 consecutively numbered object balls, the number of runs scored corresponding to the total of the numbers on the balls pocketed. Players are allowed nine innings, in each of which they play until they foul or fail to score. After the first (break) shot, players must call both the ball and the pocket aimed for before each shot. If a player sinks all the balls on the table, the balls are raked and his turn continues. For an explanation of fouls in the game, *see* pocket billiards.

Baseball Hall of Fame, in full NATIONAL BASEBALL HALL OF FAME AND MUSEUM, museum and honorary society at Cooperstown, N.Y., founded in 1936 and dedicated in 1939, in the centennial year of the supposed origination of baseball by Abner Doubleday. Players, umpires, managers, and executives who have made outstanding contributions to the game are honoured with plaques in the hall. Sports writers and announcers are eligible for special awards.

Selections to the Hall of Fame are made annually by two groups: the Baseball Writers' Association of America and the Baseball Hall of Fame Committee on Baseball Veterans. For the period 1971–77 a special committee inducted nine players from the Negro leagues into the Hall of Fame. Memorabilia of all eras of the game and an extensive baseball library are also housed in the hall and museum.

Basedow, Johann Bernhard (b. Sept. 11, 1723, Hamburg [Germany]—d. July 25, 1790, Magdeburg, Brandenburg), influential German educational reformer who advocated the use of realistic teaching methods and the introduction of nature study, physical education, and manual training into the schools. He also called for an end to physical punishment and to rote memorization in language learning.

Basedow as a boy revolted against the harsh discipline of his school and ran away from home. He became the servant of a physician, who urged him to return to school, and in 1744 entered the University of Leipzig. Brilliant but undisciplined, he refused to study and instead wrote term papers for money, tutored wealthy students, and spent his earnings in dissipation.

In 1749 he became tutor to a difficult aristocratic child, and it was then that he began inventing games as aids to teaching. His success brought him an appointment in 1753 as a teacher of philosophy at the Danish Academy of Suro. There he fascinated his students with his lectures but alienated his colleagues by his riotous living and attacks on organized religion. Expelled from the academy, he obtained a similar post at the *Gymnasium* at Altona, but this time he failed to impress his students, who were mostly aristocratic and from conservative families.

In 1768 Basedow published an acclaimed monograph demanding educational reform and calling for the creation of a laboratory school for training teachers in his methods. Two years later, backed financially by the prince of Anhalt, he set up a school, the *Philanthropinum*, in Dessau. The performances of his first pupils profoundly impressed observers, including Immanuel Kant and Johann Wolfgang von Goethe. However, his heavy drinking and emotional outbursts drove away the better teachers, and in 1784 Basedow severed his connection with the school.

Basedow's views were based on the writings of men such as John Amos Comenius, John Locke, and Jean-Jacques Rousseau. His practical teaching methods were more expansive in their implications for education than those of any of his immediate predecessors in the field, and by the early 19th century they had become a fundamental force in Germany's public school systems.

Basel, also spelled *Basle*, French *Basle*, capital of the half canton of Basel-Stadt (with which it is virtually coextensive), northern Switzerland. It lies along the Rhine River, at the mouths of the Birs and Wiese rivers, where the French, German, and Swiss borders meet, at the entrance to the Swiss Rhineland.

It was originally a Celtic settlement of the Rauraci tribe. The name Basilia seems first to have been applied to a Roman fortification mentioned in AD 374. At the beginning of the 5th century, the bishop of Augusta Raurica moved his see there. The city's university, the first in Switzerland, was founded in 1460 by Pope Pius II, who had been in Basel for the celebrated Ecumenical Council (1431–49). In 1501 Basel was admitted into the Swiss Confederation. With the Dutch scholar Desiderius Erasmus teaching at the university (1521–29), the city became a centre of humanism and of the Protestant Reformation in Switzerland. The Counter-Reformation brought skilled workmen as refugees from other parts of Europe, and by the 18th century political power was in the hands of the trade guilds. In 1831 the rural part of the canton revolted, proclaiming independence the following year; in 1833 it was organized into the half canton of Basel-Landschaft, the city forming that of Basel-Stadt.

The Rhine, bending northward, divides the city into two parts, linked by six bridges. Kleinbasel, to the north, is the Rhine port and industrial section, with the buildings of the annual Swiss Industries Fair. Grossbasel, the older commercial and cultural centre on the south bank, is dominated by the Romanesque and Gothic-style Münster (Protestant); consecrated in 1019, it was Basel's cathedral until 1528 and has a monumental slab to Erasmus, who is entombed there. Other notable buildings are the late Gothic Rathaus, or town hall

The Rathaus (town hall), Basel, Switz., fronted by market stalls

(1504–21); the Church of St. Martin, the oldest religious foundation in Basel; and the former 14th-century Franciscan church, now housing the historical museum. There are three surviving medieval city gates, of which the 15th-century Spalentor (St. Paul's Gate) is one of the finest in Europe. The new university buildings were completed in 1939; the university library contains manuscripts of the religious reformers Martin Luther, Erasmus, Huldrych Zwingli, and Philipp Melancthon and of acts of the Ecumenical Council. The public art gallery (Kunstmuseum Basel, founded 1662) has fine collections of works by Hans Holbein the Younger, Konrad Witz, and Arnold Böcklin, all of whom lived and worked in Basel.

Basel is an important distributing centre for foreign trade that produces one-third of the total Swiss Customs' revenue and is the site of the Bank for International Settlements (1930). The city is one of the nodal points of the railways of Europe and is an equally important river port. Regular air services operate from the international airport at Saint-Louis, in French territory 8

miles (13 km) northwest. Also a major industrial city, Basel is the centre of the Swiss chemical and pharmaceutical industries. Electrical engineering and banking and the manufacture of machinery and silk textiles are also important. The population is mainly German speaking and Protestant. Pop. (1988 est.) 171,574.

Basel, Confession of, moderate Protestant Reformation statement of Reformed doctrine composed of 12 articles. It was first drafted by John Oecolampadius, the Reformer of Basel, and was compiled in fuller form in 1532 by his successor at Basel, Oswald Myconius. In 1534 it was adopted by the Basel city authorities and two or three years later by the city of Muhlhausen in Alsace. It was used by the Church of Basel into the 19th century. The Confession of Basel must be distinguished from the First Helvetic Confession, which is sometimes called the Second Confession of Basel.

Basel, Council of, a general council of the Roman Catholic church held in Basel, Switz. It was called by Pope Martin V a few weeks before his death in 1431 and then confirmed by Pope Eugenius IV. Meeting at a time when the prestige of the papacy had been weakened by the Great Schism (1378-1417), it was concerned with two major problems: the question of papal supremacy and the Hussite heresy. (The Hussites were followers of the Bohemian religious Reformer Jan Hus.)

The council was inaugurated on July 23, 1431; but, when the pope's legate, Cardinal Giuliano Cesarini, arrived in September, he found few people there. In December, because of the sparse attendance, war, and the prospect of a council with the Greeks in Italy, the pope adjourned the council. The council, however, refused to be dissolved and renewed the decree *Sacrosancta* of the Council of Constance (1414-18), which declared that a general council draws its powers immediately from God and that even the pope is subject to a council's direction. More delegates arrived at Basel, and, although the number of bishops and abbots was never large, the council proceeded to deal with the Hussites, the majority of whom were received back into communion by the Compactata of Prague in November 1436.

On Dec. 15, 1433, the pope yielded and revoked his decree of dissolution. In the negotiations and discussions that followed, the council and the pope could not agree, and the council gradually lost prestige. The council proposed several antipapal measures, and in 1437 Eugenius transferred the council to Ferrara, Italy, in order to consider reunion with the Greeks. Many of the bishops at Basel accepted the move to Ferrara, but several remained at Basel as a rump council. When the rump council suspended Eugenius, he excommunicated its members. The council, with only seven bishops present, then declared Eugenius deposed and in 1439 elected as his successor a layman, the Duke of Savoy, Amadeus VIII, who took the name Pope Felix V. The next 10 years of this rump council are important only because the princes used it to strengthen their control over the churches in their own territories. On the death of Eugenius in 1447, his successor, Nicholas V, brought about the abdication of Felix V and ended the rump council in April 1449.

Basel-Landschaft (German), French BÂLE-CAMPAGNE, *Halbkanton* ("demicanton"), northern Switzerland, traversed by the Jura Mountains and drained by the Ergolz and Birs rivers. It was formed in 1833 by the division of Basel canton into two half cantons, or demicantons, and its early history is linked with Basel (*q.v.*) city. Its present constitution dates from 1892, and its capital is Liestal (*q.v.*). Approximately one-third of its 165 square miles

(428 square km) is forested. Fruit growing, dairy farming, and cattle breeding are important; textiles, metal products, and chemicals are manufactured. Watches are made in the Jura. The population is predominantly German speaking and Protestant. Pop. (1988 est.) 227,126.

Basel-Stadt (German), French BÂLE-VILLE, *Halbkanton* ("demicanton"), northern Switzerland, consisting of the city of Basel (*q.v.*) and two small villages north of the Rhine. Occupying an area of 14 square miles (37 square km), it was formed in 1833 by the division of Basel canton into two half cantons, or demicantons. Its present constitution dates from 1889. The population is mainly German speaking and Protestant. Pop. (1988 est.) 192,559.

Basel Zoological Garden, German ZOOLOGISCHER GARTEN BASEL, also called ZOLLI, privately owned zoological garden in Basel, Switz., noted for its outstanding work in the breeding of the Indian rhinoceros and the pygmy hippopotamus. The zoo was founded in 1874 for the purpose of exhibiting local wildlife. (It opened with about 100 mammals and perhaps 400 birds, mostly European.) Financial difficulties, however, forced zoo administrators to obtain exotic animals that would arouse greater public interest.

Today the zoo maintains more than 5,000 specimens of nearly 600 species on its 13-hectare (32-acre) grounds. It uses at least three-quarters of the mammal species for breeding. Besides its excellent record for the Indian rhinoceros and pygmy hippopotamus, the zoo has had considerable success breeding the gorilla, bongo (broad-horned antelope), proboscis monkey, and Malayan tapir. The zoo works closely with local universities and emphasizes a scientific approach to the husbandry of its stock. It has also developed extensive educational programs for both schoolchildren and advanced students.

baselevel, in hydrology and geomorphology, limit below which a stream cannot erode. Upon entering a still body of water, a stream's velocity is checked and thus it loses its eroding power; hence, the approximate level of the surface of the still water body is the stream's baselevel. If a stream enters the sea, its baselevel is sea level; this is known as ultimate baselevel. If a stream enters a lake, the lake level acts as a temporary baselevel for all parts of the stream above that elevation. All continental areas tend to be eroded down to ultimate baselevel, or sea level, but uplifting of the Earth's crust and variations in sea level prevent this from happening except in rare, small areas.

Basellaceae, the Madeira-vine family of flowering plants in the order Caryophyllales, with 4 genera and 15 to 25 species of herbaceous perennial vines, distributed primarily in the New World tropics. Members of the family have fleshy, untoothed leaves, tuberous rootstocks, and red or white flowers in branched or unbranched clusters. Madeira-vine, or mignonette-vine (*Anredera cordifolia* or *Boussingaultia baselloides*), and Malabar nightshade (several species of *Basella*) are cultivated as ornamentals. Malabar spinach (*Basella alba*) is a hot-weather substitute for spinach.

basenji, also called CONGO BUSH DOG, or BELGIAN CONGO DOG, ancient breed of hound dog native to central Africa, where it is used to point and retrieve and to drive quarry into a net. It is also known as the barkless dog, but it does produce a variety of sounds other than barks. A graceful animal, it is characterized by an alert expression typified by the finely wrinkled forehead, erect ears, and tightly curled tail. The short, silky coat is reddish brown, black, or black-and-tan; feet, chest, and tail

Basenji
Sally Anne Thompson—EB Inc

tip are white. The basenji stands 41 to 43 cm (16 to 17 inches) tall and weighs 10 to 11 kg (22 to 24 pounds). It is characterized as a clean and gentle dog.

BASF Aktiengesellschaft (German: BASF Limited-liability Company), German chemical and plastics manufacturing company originally founded in 1865 and today operating in some 30 countries. The BASF Group produces oil and natural gas, chemicals, fertilizers, plastics, synthetic fibres, dyes and pigments, potash and salt, inks and printing accessories, electronic recording accessories, cosmetic bases, pharmaceuticals, and other related equipment and products. Headquarters are in Ludwigshafen am Rhein, Ger.

The company was founded in 1865 in Mannheim, as Badische Anilin- & Soda-Fabrik (Baden Aniline & Soda Factory), one of the first dyestuff manufacturers producing a full range of chemicals from basic materials to finished products. The principal founder was Friedrich Engelhorn (1821-1902), a former goldsmith and manufacturer of coal-tar dyes. In 1919 head offices moved across the Rhine to Ludwigshafen. From 1925 to 1945, the company was part of IG Farben (*q.v.*), the world's largest chemical concern; the latter was dissolved by the Allies in 1945, and Badische Anilin- & Soda-Fabrik, refounded in 1952, became one of the three successor firms. The shortened name, BASF Aktiengesellschaft, was adopted in 1973.

Bashan, country frequently cited in the Old Testament and later important in the Roman Empire; it is located in what is now Syria. Bashan was the northernmost of the three ancient divisions of eastern Palestine, and in the Old Testament it was proverbial for its rich pastures and thick forests. In New Testament times, Bashan numbered as one of the great granaries of the Roman Empire. Ashtaroth, Edrei, Golan, and Salchah were important Old Testament towns of Bashan. Bozrah (Roman Bostra) was an important Nabataean and Roman city.

The Israelites defeated Og, king of Bashan, at his frontier city Edrei (Numbers 21:33 ff.) and assigned his land to half the tribe of Manasseh. From 84 to 81 bc Bashan was ruled by Alexander Jannaeus of Judaea, but the land to the east belonged to the Nabataeans. The Romans drove the Nabataeans southward (64 bc), and Bozrah and Salchah became the northernmost Nabataean towns. The Roman emperor Augustus made Herod the Great ruler of Bashan. In ad 106 Trajan brought the whole Nabataean kingdom under the empire in creating the province of Arabia with Bostra (Bozrah) as its capital. Bostra eventually became the ecclesiastical capital of the Hauran and a trading centre second only to Damas-

cus. By AD 635 Damascus had fallen to the Muslims, and thereafter Bashan's prosperity declined.

bashi-bazouk, Turkish BAŞIBOZUK ("corrupted head," or "leaderless"), mercenary soldier belonging to the skirmishing or irregular troops of the Ottoman Empire, notorious for their indiscipline, plundering, and brutality. Originally describing the homeless beggars who reached Istanbul from the provinces of the Ottoman Empire, the term *bashi-bazouk* was later applied to all Muslim subjects who were not members of the armed forces. Finally it was applied to units of irregular volunteers (both infantry and cavalry) attached to the army but under independent officers and providing their own weapons and horses. These forces became notorious for their lawlessness. They appeared at the end of the 18th century and fought in Egypt against Napoleon. During the Crimean War the allied generals made fruitless attempts to discipline them. Their excesses during the Russo-Turkish War of 1877-78 at last forced the Ottoman government to abandon their use.

Bashir Shihab II (b. 1767, Ghazir, Lebanon—d. 1850, Istanbul, Tur.), Lebanese prince who established hegemony over Lebanon in the first half of the 19th century and ruled it under Ottoman and, later, Egyptian suzerainty from 1788 to 1840.

Although born into the princely Shihab family, Bashir grew up in poverty but married into great wealth. In 1788 the Lebanese emir was forced to abdicate, and the local nobility selected Bashir to fill the post. As emir, Bashir had to raise tribute for Ahmad al-Jazzar, an official nominated by the Ottoman sultan to administer the district of Lebanon. After the death of al-Jazzar (1804), the financial demands were much less severe, and Bashir was able to consolidate his position. With the notable exception of the Jānbulāṭs, he destroyed the power of the Druze princes, on whose support Lebanese emirs had usually depended.

In 1821 Bashir provided military support to the pasha of Acre, who tried to draw the city of Damascus under his authority. But the Ottoman sultan declared the pasha a rebel, and Bashir fled to Egypt. Later, after the pasha was pardoned, Bashir returned to Lebanon, where, in his absence, Jānbulāṭ had plotted against him. By having Jānbulāṭ killed, Bashir became the undisputed ruler of Lebanon.

When Muḥammad 'Ali occupied the Fertile Crescent (exclusive of Iraq) in the 1830s, Bashir cooperated fully with the new regime in establishing order. In 1837 he armed 4,000 Christians to put down a rebellion that the Druzes had begun when threatened with conscription (hitherto Lebanese rulers had avoided direct clashes between the two groups). Two years later Bashir tried to disarm the same Christians whom he had previously armed, clearly as a prelude to their conscription. The Christians were determined to resist, even if it meant cooperating with the Druzes. A Druze and Christian rebellion against Bashir broke out in June 1840, supported by the British, who were intent on driving Muḥammad 'Ali out of the Fertile Crescent. Bashir could not reassert his authority, and in October he was forced into exile in Malta.

Bashkir, member of a Turkic people, numbering more than 1,070,000 in the late 20th century, settled in the eastern part of European Russia, between the Volga River and the Ural Mountains, and beyond the Urals. Their main territory is Bashkortostan, where they are far outnumbered by Russians.

The Bashkirs settled their land under the Mongol khanate of Kipchak from the 13th to the 15th century. In 1552 the area passed

into the hands of the Russians, who founded Ufa in 1574 and thereafter began colonization of the area, dispossessing the Bashkirs. This led to many Bashkir uprisings, which were severely repressed. In 1919 the Bashkir Autonomous Republic was set up, among the first such republics in the Soviet Union.

The Bashkirs were originally nomadic pastoralists, like other Turks, and their stock consisted of horses, sheep, and, to a lesser extent, cattle and goats. Mare's milk was made into koumiss, a fermented drink; sheep were raised for wool, skins, and meat; and cattle were milked. At one time the Bashkirs bred camels. During the 19th century, through pressure by Russian colonists and colonial policy, the Bashkirs settled, gave up nomadic life, and developed a primary dependence on agriculture for support. This is the case today; pastoralism plays a subordinate role in their economy.

In settling down they established themselves in fixed villages with houses of earth, sundried brick, or logs. They were formerly divided into patrilineal clans and tribes. These groups bore names that are remembered today but have lost most of their social significance. Formerly the Bashkirs were organized, reckoned kinship, ran their affairs, sought help, and regulated disputes within these clan and tribal structures. The village is the key social structure today. The religions of the Bashkir are Islām and the Eastern Orthodox rite.

Bashkortostan, also called BASHKIRIYA, republic in Russia, extending from the western slopes of the southern Ural Mountains in the east to the rolling hills of the Bugulma-Belebey Upland in the west.

From Mount Yamantau, the highest peak in the southern Urals, elevation generally decreases southward and westward, with the heavily forested mountains giving way to open steppe interspersed with islands of mainly deciduous trees and to the floodplains of the Belaya River. The largest tributary of the Kama and the main water route of the republic, the Belaya rises in the southern Urals, flows southwest and then northwest, and separates the mountainous east from the upland west. Cold Siberian air masses severely affect the humid, continental climate of the republic. Extreme temperatures of -49°F (-45°C) in the winter and 97°F (36°C) in the summer may be recorded. The southern part of the republic suffers from the scorching and drought-producing *sukhovoy* winds in late spring and summer. Rainfall varies from 16 to 20 inches (400 to 500 mm) in the steppe areas to 24 inches (600 mm) in the mountains.

Settled during the khanate of the Golden Horde by the Turkic Bashkirs, the area passed to Russia in 1552 after the overthrow of the Kazan khanate by Tsar Ivan IV the Terrible. In 1574 the Russians founded Ufa (*q.v.*), now the capital and largest city of the republic. By the middle of the 18th century, copper and iron production had begun in the area, and it was an autonomous republic of the U.S.S.R. from 1919 to 1991.

Included in the Volga economic region of Russia, Bashkortostan has developed both agriculturally and industrially. The republic's rich mineral resources provide many raw materials for its expanding industries. Oil and natural gas are extracted from oil fields near Ufa and Neftekamsk in the northwest, at Belebey in the west, and at Ishimbay on the middle Belaya; iron ore and manganese are mined in the Urals, copper in the southeast, and salt near Sterlitamak (*q.v.*); and quarries provide materials for the glass and cement industries. Petroleum production, refining, and processing rank as the most important of the republic's industries. The main refineries at Ufa, Ishimbay, and Salavat are linked by a pipeline network with both regional oil fields and those of the republic of Tatarstan. Iron and steel centres at Beloretsk and Tirylyansky

produce steel cables, wire, and sheet steel, used in the manufacture of machine tools, petroleum and mining equipment, motor engines, electric cables, telephones, and typewriters. The chemical industry uses oil and gas by-products, and the timber industry produces veneer, furniture, matches, and paper for manufacture. Large power plants are located at Ufa, Sterlitamak, Ishimbay, Kumertau, Salavat, and Karmanovo.

Agriculture is most important in the Belaya River valley. The main agricultural products include rye, oats, corn (maize), flax, sugar beets, potatoes, and sunflowers; market gardening flourishes around Ufa and Sterlitamak, while stock raising (cattle, sheep, goats) predominates in the Urals. The area is noted for its breed of horses, and beekeeping, a traditional occupation, is widespread. Rail and motor roads radiate from Ufa, which also has an airport; one of the main trans-Urals railway routes passes through the capital, and branch lines from it lead to other industrial centres of the republic, to Magnitogorsk, and to the mountainous regions of Bashkortostan.

The population of Bashkortostan comprises Russians, Tatars, Bashkirs, Chuvash, Mari, Ukrainians, and Mordvinians; 65 percent were urban in 1991. Sterlitamak and Salavat rank with Ufa as major cities. The republic has several institutes of higher education, over 1,700 libraries, and many theatres, several of which have performances in the Bashkir language. Area 55,400 square miles (143,600 square km). Pop. (1991 est.) 3,983,900.

Bashō, in full MATSUO BASHŌ, pseudonym of MATSUO MUNEFUSA (b. 1644, Ueno, Iga Province, Japan—d. Nov. 28, 1694, Ōsaka), considered the greatest of the Japanese haiku poets, who greatly enriched the 17-syllable haiku form, imbuing it with the spirit of Zen Buddhism and making it an accepted medium of artistic expression.

Interested in haiku from an early age, Bashō at first put his literary interests aside and entered the service of a local feudal lord. After his lord's death in 1666, however, Bashō abandoned his samurai (warrior) status to devote himself to poetry. Moving to the capital city of Edo (now Tokyo), he gradually acquired a reputation as a poet and critic. In 1679 he wrote his first verse in the "new style" for which he came to be known:

On a withered branch
A crow has alighted:
Nightfall in autumn.

The simple descriptive mood evoked by this statement and the comparison and contrast of two independent phenomena became the hallmark of Bashō's style. He attempted to go beyond the stale dependence on form and ephemeral allusions to current gossip that had been characteristic of haiku, which in his day had amounted to little but a popular literary pastime. Instead he insisted that the haiku must be at once unhackneyed and eternal.

Bashō, detail of an India ink portrait by Morikawa Kyoroku; in a private collection

By courtesy of the International Society for Educational Information, Tokyo

Following the Zen philosophy he studied, Bashō attempted to compress the meaning of the world into the simple pattern of his poetry, disclosing hidden hopes in small things and showing the interdependence of all objects.

In 1684 Bashō made the first of many journeys that figure so importantly in his work. His accounts of his travels are prized not only for the haiku that record various sights along the way but also for the equally beautiful prose passages that furnish the backgrounds. *Oku no hosomichi* (1694; *The Narrow Road to the Deep North*), describing his visit to northern Japan, is one of the loveliest works of Japanese literature.

On his travels Bashō also met local poets and competed with them in composing the linked verse (*renga*), an art in which he so excelled that some critics believe his *renga* were his finest work. When Bashō began writing *renga* the link between successive verses had generally depended on a pun or play on words, but he insisted that poets must go beyond mere verbal dexterity and link their verses by "perfume," "echo," "harmony," and other delicately conceived criteria.

One term frequently used to describe Bashō's poetry is *sabi*, which means the love of the old, the faded, and the unobtrusive, a quality found in the verse

Scent of chrysanthemums . . .
And in Nara
All the ancient Buddhas.

Here the musty smell of the chrysanthemums blends with the visual image of the dusty, flaking statues in the old capital. Living a life that was in true accord with the gentle spirit of his poetry, Bashō maintained an austere, simple hermitage that contrasted with the general flamboyance of his times. On occasion he withdrew from society altogether, retiring to Fukagowa, site of his Bashō-an ("Cottage of the Plantain Tree"), a simple hut from which the poet derived his pen name. Later men, honouring both the man and his poetry, revered him as the saint of the haiku.

Basic English, simplified form of English developed between 1926 and 1930 by the British writer and linguist Charles Kay Ogden. Intended for use as an international second language, it enjoyed some popularity for more than a decade, but subsequently the language was little used.

Basic English derives its vocabulary and grammar from English but reduces both to a remarkable extent: there are 850 basic vocabulary items, 600 of which are nouns and 150 of which are adjectives. The remaining 100 are operative words such as "can," "do," "across," "after," "to," "the," "all," "if," "not," and "very." Only 18 verbs are used, and these are conjugated as in standard English; but through combination with nonverbs these 18 verbs can replace about 4,000 standard English verbs (e.g., "put together" for "assemble" or "combine"; "make up" for "invent"; "take pictures" for "photograph"). There are only a few rules concerned with formation of plurals, comparative degrees of adjectives, and use of such prefixes and suffixes as *un-*, *-er*, *-ing*, *-ed*, and *-ly*. Features of the language are dealt with in Ogden's books *Basic English* (1930), *The Basic Words* (1932), and *The ABC of Basic English* (1932).

basic oxygen process (BOP), a steelmaking method in which pure oxygen is blown into a bath of molten blast-furnace iron and scrap. The oxygen initiates a series of intensively exothermic (heat-releasing) reactions, including the oxidation of such impurities as carbon, silicon, phosphorus, and manganese.

The advantages of using pure oxygen instead of air in refining pig iron into steel were recognized as early as 1855 by Henry Bessemer, but the process could not be brought to commercial fruition until the 20th century, when

large tonnages of cheap, high-purity oxygen became available. Commercial advantages include high production rates, less labour, and steel with a low nitrogen content. Development of the BOP was initiated in Switzerland by Robert Durrer in the late 1940s. After experimenting with a 2.5-ton pilot unit, Durrer worked with engineers at the Voest company at Linz, Austria, who set up a commercially operating 35-ton converter in 1952. A second unit began operation within a year at Donawitz, also in Austria. Consequently, the BOP was first known as the LD (Linz-Donawitz) process. Within 40 years, virtually all of the steel in Japan and more than half of the steel worldwide was produced by the BOP.

A typical top-blown basic oxygen furnace is a vertical cylindrical vessel with a closed bottom and an open upper cone through which a water-cooled oxygen lance can be raised and lowered. The vessel is lined with a refractory such as magnesite and is mounted on trunnions so that it can be tilted for charging and also for tapping liquid steel. A charge typically consisting of 70–75 percent molten blast-furnace iron (containing approximately 4 percent carbon), 25–30 percent scrap metal, and lime and other fluxes is fed into the furnace. The lance is lowered into the vessel, and oxygen is injected into the bath at supersonic velocities with flow rates that can exceed 800 cubic m (28,000 cubic feet) per minute. The duration of the oxygen "blow," normally close to 20 minutes, is varied to reduce the carbon in the steel to the required level. The steel is then tapped into a ladle at temperatures close to 1,600° C (2,900° F), and appropriate ferroalloys and deoxidizers are added to meet the required steel composition. "Heats" of steel, ranging in size from 30 to 360 tons, can be produced in 30 to 45 minutes.

Another, though less common, oxygen steel-making system is a bottom-blown process known as the Q-BOP (quick-quiet BOP) in North America and the OBM (from the German, *Oxygen bodenblasen Maxhütte*, or "oxygen bottom-blowing furnace") in Europe. In this system, oxygen is injected with lime through nozzles, or tuyeres, located in the bottom of the vessel. The tuyeres consist of two concentric tubes: oxygen and lime are introduced through the inner tube, and a hydrocarbon such as natural gas is injected through the outer annulus. The endothermic (heat-absorbing) decomposition of the hydrocarbon near the molten bath cools the tuyeres and protects the adjacent refractory. Yet another variation, which has found wide application in top-blown furnaces, is the injection of inert gases into the molten bath through permeable blocks in the bottom of the vessel for the purpose of enhancing chemical reactions.

basidiocarp, in fungi, a large sporophore, or fruiting body, in which sexually produced spores are formed on the surface of club-shaped structures (basidia). Basidiocarps are found among the members of the class Basidiomycetes (*q.v.*), with the exception of the rust and smut fungi. The largest basidiocarps include giant puffballs (*Calvatia gigantea*), which can be 1.6 m (5.25 feet) long, 1.35 m broad, and 24 cm (9.5 inches) high, and those of bracket fungi (*Polyporus squamosus*)—2 m in diameter. The smallest are single cells of the yeastlike *Sporobolmyces*.

Basidiomycetes, a large and diverse class of fungi (division Mycota) including jelly and shelf, or bracket, fungi; mushrooms, puffballs, and stinkhorns; and the rusts and smuts. The club-shaped spore-bearing organ (basidium) usually produces four sexual spores (basidiospores). Basidia are borne on fruiting bodies (basidiocarps), which are large and conspicuous in all but the rusts and smuts.

The common name bird's nest fungus includes species of the genera *Crucibulum*, *Cyathus*, and *Nidularia* of the order Nidulariales

(about 60 species). The hollow fruiting body resembles a nest containing eggs (peridioles). The peridioles carry the spores when they disperse at maturity.

The 15 species of the order Exobasidiales do not form fruiting bodies. The species, parasitic on higher plants, cause leaf spots, witches'-

Jelly fungus (*Tremella mesenterica*)
Larry C. Moon—Tom Stack & Associates

broom (tufted growth), and galls (swellings). Particularly affected are azaleas and rhododendrons.

Jelly fungus is the common name for several species of the cosmopolitan order Tremellales, including those of the genus *Tremella* (40 species), so called because they have jellylike fruiting bodies. Frequently brightly coloured (especially yellow and orange) or white, the fungi occur on decaying wood after heavy rains in late summer.

The ear fungus (*Auricularia auricula-judae*), also called Jew's ear fungus, is a brown, gelatinous edible fungus found on dead tree trunks in moist weather in the autumn. One of 10

Auricularia
H.R. Hungerford

widespread *Auricularia* species, it is ear- or shell-shaped and sometimes acts as a parasite, especially on elder (*Sambucus*).

Basie, Count, byname of WILLIAM BASIE (b. Aug. 21, 1904, Red Bank, N.J., U.S.—d. April 16, 1984, Hollywood, Fla.), American pianist and composer and one of the outstanding organizers of big bands in jazz history.

Basie studied music with his mother and was later influenced by the Harlem pianists James P. Johnson and Fats Waller, receiving informal tutelage on the organ from the latter. He began his professional career as an accompanist on the vaudeville circuit. Stranded in Kansas City, Mo., in 1927, Basie remained there and eventually (in 1935) assumed the leadership of a nine-piece band, composed of former members of the Walter Page and Bennie Moten orchestras. One night, while the band was broadcasting on a short-wave radio station in Kansas City, the announcer dubbed him "Count" Basie to compete with such other bandleaders as Duke Ellington. The jazz critic John Hammond heard the broadcasts in New York City and promptly launched the band on its career in Chicago. Though rooted in the riff style of the 1930s swing-era bands,

the Basie band included soloists who reflected the styles of their own periods. In this way the band was a springboard for tenor saxophonist Lester Young, trumpeter Buck Clayton, trumpeter-composer Thad Jones, and others. Many musicians considered Basie's to be the major big band in jazz history, a model for ensemble rhythmic conception and tonal balance.

Count Basie, 1969
Ron Joy—Globe Photos

During the late 1930s the accompanying unit for the band (pianist Basie, rhythm guitarist Freddie Green, bassist Walter Page, and drummer Jo Jones) was unique in its lightness, precision, and relaxation, becoming the precursor for modern jazz accompanying styles. Basie's syncopated and spare but exquisitely timed chording, commonly termed "comping," became the model for what was expected from combo pianists in their improvised accompaniments for the next 30 years of jazz. Despite its influence on modern piano styles, Basie's solo technique had roots in the pre-swing-era style of Fats Waller, and Basie continued to display such a "stride style" in performances during the early 1980s.

Arrangements for the early Basie band were informally worked out and memorized. His hits "One O'Clock Jump" and "Jumpin' at the Woodside" were done this way. Arrangements used in the later years maintained a style developed for his 1950s bands by Neal Hefti and Ernie Wilkins. Raymond Horrick's *Count Basie and Orchestra* was published in 1957.

BYZANTINE EMPIRE

● **Basil I**, byname **BASIL THE MACEDONIAN** (b. 826–835?, Thrace—d. Aug. 29, 886), Byzantine emperor (867–886), who founded the Macedonian dynasty and formulated the Greek legal code that later became known as the *Basilica*.

Basil came of a peasant family that had settled in Macedonia, perhaps of Armenian origin. He was a handsome and physically powerful man who gained employment in influential official circles in Constantinople and was fortunate enough to attract the imperial eye of the reigning emperor, Michael III. Af-

ter rapid promotion he became chief equerry, then chamberlain, and finally, in 866, co-emperor with Michael. Quick to sense opposition, he forestalled the Emperor's uncle, the powerful Caesar Bardas, by murdering him (866) and followed this by killing his own patron, Michael, who had begun to show signs of withdrawing his favour (867).

From the mid-9th century onward, the Byzantines had taken the offensive in the ageing struggle between Christian and Muslim on the eastern borders of Asia Minor. Basil continued the attacks made during Michael III's reign against the Arabs and their allies, the Paulicians, and had some success. Raids across the eastern frontier into the Euphrates region continued, though Basil did not manage to take the key city of Melitene. But the dangerous heretical Paulicians on the borders of the Armenian province in Asia Minor were crushed by 872, largely owing to the efforts of Basil's son-in-law Christopher. In Cilicia, in southeast Asia Minor, the advance against the Emir of Tarsus succeeded under the gifted general Nicephorus Phocas the Elder. Though Constantinople had lost much of its former naval supremacy in the Mediterranean, it still had an effective fleet. Cyprus appears to have been regained for several years.

Basil's plans for Italy involved him in negotiations with the Frankish emperor Louis II, the great-grandson of Charlemagne. The Byzantine position in southern Italy was strengthened with the help of the Lombard duchy of Benevento, and the campaigns of Nicephorus Phocas the Elder did much to consolidate this. The region was organized into the provinces of Calabria and Langobardia. But key cities in Sicily, such as Syracuse in 878, still continued to fall into Muslim hands, an indication of the strength of Arab forces in the Mediterranean.

Another arm of Byzantine policy was the attempt to establish some measure of control over the Slavs in the Balkans. Closely allied to this was the delicate question of ecclesiastical relations between Constantinople and Rome.

Basil I, coin, 9th century; in the British Museum
By courtesy of the trustees of the British Museum

During Basil I's reign, the young Bulgar state accepted the ecclesiastical jurisdiction of Constantinople (870). This had significant results both for the Balkan principalities and for the Orthodox Church, as well as greatly strengthening Byzantine influence in the south Slav world. Basil had inherited a quarrel between Photius and Ignatius as to which was to be patriarch of Constantinople. This had international implications, since appeals had been made to Rome. Immediately on his accession, Basil attempted to win support at home and to conciliate Rome by reinstating the deposed patriarch Ignatius and excommunicating Photius. Eventually, Photius was restored by Basil on the death of Ignatius (877) and recognized by Rome in 879. Contrary to the belief that used to be held, no "second schism" occurred. Basil successfully resolved

the tension between liberal and strict Byzantine churchmen and managed to maintain a show of peace between East and West despite Rome's displeasure at the marked extension of imperial influence in the new Balkan principalities.

Toward the end of his life, Basil seemed to suffer fits of derangement, and he was cruelly biased against his son Leo. Basil died on the hunting field. The 11th-century historian Psellus wrote of his dynasty as "more blessed by God than any other family known to me, though rooted in murder and bloodshed." But Macedonian historians were understandably biased in favour of the existing dynasty, to the detriment of the rulers it had supplanted. Recent historical research has raised the stature of Basil's predecessor, Michael III, and his regents. It is now generally agreed that the "new age" in Byzantine history began with Michael III in 842 and not with the Macedonian dynasty in 867. Basil's policies were largely determined, both at home and abroad, by factors not of his own making.

(J.M.H.)

BIBLIOGRAPHY. A good short outline of Byzantine history is G. Osirogorsky, *Geschichte des byzantinischen Staates*, 3rd ed. (1963; *History of the Byzantine State*, 2nd ed., 1968). Views on Basil I, particularly in relation to his predecessor, Michael III, are presented in H. Gregorie, "The Amorians and Macedonians 842–1025," *Cambridge Medieval History*, new ed., 4:105–192 (1966).

● **Basil II**, byname **BASIL BULGARCTONUS** (Greek: Basil, Slayer of the Bulgars) (b. 957/958—d. Dec. 15, 1025), Byzantine emperor (976–1025), who extended imperial rule in the Balkans (notably Bulgaria), Mesopotamia, Georgia, and Armenia and increased his domestic authority by attacking the powerful landed interests of the military aristocracy and of the church.

The reign of Basil II, widely acknowledged to be one of the outstanding Byzantine emperors, admirably illustrates both the strength and the weakness of the Byzantine system of government. His indomitable and forceful personality and his shrewd statesmanship were offset by the inherent weakness of an imperial autocracy that depended so much on the character of the ruler.

Basil was the son of Romanus II and Theophano and was crowned co-emperor with his brother Constantine in 960, but as minors both he and his brother remained in the background. After their father's death in 963, the government was effectively undertaken by the senior military emperors, first by Nicephorus II Phocas, their stepfather, and then by John I Tzimisces. On the latter's death (976) the powerful great-uncle of Basil II, the eunuch Basil the chamberlain, took control. His authority—and that of Basil II—was challenged by two generals who coveted the position of senior emperor. Both related to emperors, they belonged to powerful landed families and commanded outside support from Georgia and from the Caliph in Baghdad. After a prolonged struggle both were defeated by 989, though only with the help of Russians under Vladimir of Kiev, who was rewarded with the hand of Basil II's sister Anna on condition that the Kievan state adopted Christianity. Certain Russian soldiers remained in Basil II's service, forming the famous imperial Varangian guard. Eventually, Basil II asserted his claim to sole authority by ruthlessly eliminating the dominating grand chamberlain, who was exiled in 985.

Basil II aimed solely at the extension and consolidation of imperial authority at home and abroad. The main fields of external conflict were in Syria, Armenia, and Georgia on the eastern front, in the Balkans, and in southern Italy. He maintained the Byzantine position in Syria against aggression stirred up

by the Fātimid dynasty in Egypt and on occasion made forced marches from Constantinople across Asia Minor to relieve Antioch. By aggression and by diplomacy he secured land from Georgia and from Armenia, with the promise of more to come on the death of the Armenian ruler. He is, however, best known for his persistent and ultimately successful campaigns against a revived Bulgarian kingdom under its tsar Samuel. This ruler centred his activities in Macedonia and established his hegemony in the west Balkans. From 986 until 1014 there was warfare between Byzantium and Bulgaria, interrupted from time to time by Basil II's intermittent expeditions to settle crises on the eastern front. Basil II enlisted Venetian help in protecting the Dalmatian coast and Adriatic waters from Bulgarian aggression. Year by year he slowly penetrated into Samuel's territory, campaigning in winter as well as summer. Finally, holding northern and central Bulgaria, he advanced toward Samuel's capital, Ochrida, and won the crushing victory that gave him his byname, "Slayer of the Bulgars." It was then that he blinded the whole Bulgarian army, leaving one eye to each 100th man, so that the soldiers might be led back to their tsar (who died of shock shortly after seeing this terrible spectacle). Thus the revived Bulgarian kingdom was incorporated into the Byzantine Empire. Basil II then looked further west and planned to strengthen Byzantine control in southern Italy and to regain Sicily from the Arabs. He attempted to establish a Greek pope in Rome and to unite in marriage the German (though by birth half Byzantine) ruler Otto III with Basil II's favourite niece, Zoe. Both schemes failed, but he was more successful in southern Italy, where order was restored, and at his death preparations were being made for the reconquest of Sicily.

The ruthlessness and tenacity that served Basil II in his military and diplomatic activities were displayed in his domestic policy as well. Its keynote was the strengthening of imperial authority by striking at his overpowerful subjects, particularly the military families who ruled like princes in Asia Minor. The by-product of this policy was the imperial protection of the small farmers, some of whom owed military service to the crown and paid taxes to the central exchequer. Title to land was rigorously inspected, and vast estates were arbitrarily confiscated. Thus, in spite of his costly wars, Basil left a full treasury, some of it stored in specially constructed underground chambers.

Both in near-contemporary history and in manuscript illustrations, Basil II is pictured as a short, well-proportioned figure, with brilliant light-blue eyes, a round face, and full, bushy whiskers, which he would twirl in his fingers when angry or while giving an audience. He dressed plainly and even when wearing the purple chose only a dark hue. An abrupt speaker, he scorned rhetoric yet was capable of wit. He has been described as mean, austere, and irascible, spending most of his time as though he were a soldier on guard. He knew only too well the danger of any relaxation. He showed no obvious interest in learning, but he did apparently commission works of religious art, and he had churches and monasteries rebuilt or completed in Boeotia and in Athens, though this may be accounted for by conventional piety. He seems never to have married or had children. On his death there was no able military aristocrat or other leader to take the situation in hand, and thus Basil II's work was rapidly undone. (J.M.H.)

MOLDAVIA

• **Basil**, byname **BASIL THE WOLF**, Romanian **VASILE LUPU** (b. c. 1595—d. 1661, Constantinople), ambitious and enterprising prince of Moldavia (1634-53) who introduced the first written laws and printing press to his principality.

Albanian in origin, Basil acceded to the throne of Moldavia in the spring of 1634. He intrigued throughout his reign to acquire the Walachian throne as well, and in 1637 and 1639 led unsuccessful expeditions against the ruling prince of Walachia, Matthew Basarab. Basil's military expenses and payments to his Turkish overlords taxed his subjects; but his rule also brought important cultural improvements through the creation of Greek monastic schools, the first codification of Moldavian civil and criminal law (1646), and the establishment of the first printing press in the country at Iași. In 1653 he was briefly evicted from his throne by Matthew Basarab and the Prince of Transylvania, but regained his crown with the help of the cossacks of Bohdan Chmielnicki, hetman of the Ukraine and also his son-in-law. He subsequently pressed into Walachia, but was decisively beaten at Vinta (July 1653). Deposed by his own boyars, he fled to the Khan of the Tatars, and thence to Constantinople, where he died in prison. His reign was one of the longest in the history of Moldavia.

RUSSIA

• **Basil I-IV**: see Vasily I-IV.

basil, also called **SWEET BASIL**, spice consisting of the dried leaves of *Ocimum basilicum*,

Basil (*Ocimum basilicum*)

Walter Chandoha

an annual herb of the family Lamiaceae (Labiatae) native to India and Iran. A number of varieties are used in commerce including the small-leaf common basil, the larger leaf Italian basil, and the large lettuce-leaf basil. The dried large-leaf varieties have a fragrant aroma faintly reminiscent of anise, and a warm, sweet, aromatic, mildly pungent flavour. The dried leaves of the common basil are less fragrant and more pungent in flavour. Basil is widely grown as a kitchen herb and used fresh or dried to flavour meats, fish, salads, and sauces. Tea made from basil leaves is a stimulant. The essential oil content is 0.1 percent, the principal components of which are methyl chavicol and *d*-linalool.

The heart-shaped basil leaf is a symbol of love in Italy.

Basil OF ANCYRA (d. c. 364, Illyria), Greek theologian and bishop of Ancyra (now Ankara, Tur.) whose attempt to mediate a controversy in the Eastern Church was rejected by the heretical faction and brought about his exile.

Basil, a physician, was nominated bishop in 336 by the Semi-Arian party (see Semi-Arianism). In a *Synodal Letter* sent to all bishops summarizing the conclusions of a local council in Ancyra (358), Basil's clear enunciation of the Semi-Arian viewpoint established him as that group's intellectual leader.

Despite the efforts of Basil and his colleagues, the Arians (see Arianism) gained the support of the emperor Constantius II (ruled 337-361) and repudiated Basil's formula at two councils convened in 359. Basil's party was compelled by Constantius II in December 359 to sign the heretical Arian formula of Ariminum. The Arians, led by Bishop Acacius of Caesarea, met in synod at Constantinople in 360, deposed Basil, and banished him to Illyria.

Before his death, however, Basil recanted his signature of the Arian formula extorted from him by the Emperor. The orthodox party, represented by Athanasius of Alexandria and Hilary of Poitiers, acknowledged that Basil's formula approximated their own and urged others to seek a consensus with him.

Among Basil's other writings is a treatise on virginity, which suggests that this virtue can be secured on the basis of bodily harmony fostered by an ascetical life.

Basil THE BLIND: see Vasily II.

Basil THE CHAMBERLAIN (d. 985), eunuch minister of the Byzantine Macedonian dynasty.

After the death of the emperor John I, Basil the Chamberlain controlled the throne for his two grandnephews and co-emperors Constantine and Basil II. After engineering his uncle's downfall, Basil II was finally able to assume his own independent rule.

Basil THE GREAT, SAINT, Latin **BASILIVS** (b. c. AD 329, Caesarea Mazaca, Cappadocia—d. Jan. 1, 379, Caesarea; Western feast day January 2; Eastern feast day January 1), early Church Father who defended the orthodox faith against the heretical Arians. As bishop of Caesarea he wrote several works on monasticism, theology, and canon law. He was declared a saint soon after his death.

Early life and ecclesiastical career. Basil was born of a distinguished family of Caesarea, the capital of Cappadocia, which was a province of Asia Minor of special importance

Saint Basil, detail of a mosaic, 12th century; in the Palatine Chapel, Palermo

Alinari—Art Resource

in the 4th century due to its position on the military road between Constantinople and Antioch. The family had been Christian since the

days of the persecutions of Christians, which ended early in the 4th century. One of Basil's uncles was a bishop, as later were two of his brothers (Gregory and Peter of Sebaste). He received a literary education, however, which would have fitted him to follow in his father's footsteps as lawyer and orator. He studied at Caesarea and Constantinople and, finally (c. 351–356), at Athens, where he developed his friendship with Gregory of Nazianzus. On returning home he began a secular career, but the influence of his pious sister Macrina, later a nun and abbess, confirmed his earlier inclination to the ascetic life. With a group of friends, he established a monastic settlement on the family estate at Annesi in Pontus. In 357 he made an extensive tour of the monasteries of Egypt, and in 360 he assisted the Cappadocian bishops at a synod at Constantinople. He had been distressed by the general acceptance of the Arian Creed of the Council of Ariminum the previous year and especially by the fact that his own bishop, Dianius of Caesarea, had supported it. Shortly before the death of Dianius (362), Basil was reconciled to him and later was ordained presbyter (priest) to assist Dianius' successor, the new convert Eusebius. Basil's abilities and prestige, as well as Eusebius' dislike of asceticism, led to tension between them, and Basil withdrew to Annesi. In 365 he was called back to Caesarea, when the church was threatened by the Arian emperor Valens. His theological and ecclesiastical policy thereafter aimed to unite against Arianism the former semi-Arians and the supporters of Nicaea under the formula "three persons (*hypostases*) in one substance (*ousia*)," thus preserving both unity and the necessary distinctions in the theological concept of the godhead. On Eusebius' death in 370, Basil became his successor, although he was opposed by some of the other bishops in the province.

Anti-Arian activities. As bishop of Caesarea, Basil was metropolitan (ecclesiastical primate of a province) of Cappadocia, and his own diocese covered the great estates of eastern Cappadocia, where he was assisted by a number of "country bishops" (*chorepiscopi*). He also founded charitable institutions to aid the poor, the ill, and travellers. When Valens passed through Caesarea in 371, Basil dramatically defied his demand for submission. But in 372 Valens divided the province, and Basil considered this a personal attack, since Anthimus of Tyana thus became metropolitan for the cities of western Cappadocia. Basil countered by installing supporters in some of the border towns—Gregory of Nazianzus at Sasima and his own brother Gregory at Nyssa. This tactic was only partially successful, but Basil escaped the attacks that Valens launched on orthodox bishops elsewhere. Meanwhile, Basil tried to secure general support for the former semi-Arian Meletius as bishop of Antioch (one of the five major patriarchates of the early church), against Paulinus, the leader of the strict Nicene minority, since he feared that the extreme Nicenes at this point were lapsing into Sabellianism, a heresy exaggerating the oneness of God. During Basil's lifetime, however, this was prevented by the recognition of Paulinus by the bishops of Alexandria and—in spite of a series of negotiations—after 375 by Pope Damasus of Rome.

Basil's numerous and influential writings stemmed from his practical concerns as monk, pastor, and church leader. The *Longer Rules* and *Shorter Rules* (for monasteries) and other ascetic writings distill the experience that began at Annesi and continued in his supervision of the monasteries of Cappadocia: they were to exert strong influence on the monastic life of Eastern Christianity. A notable feature is Basil's strong preference for the monastic

life, in which brotherly love can be practiced, as opposed to that of the hermit. Basil's preserved sermons deal mainly with ethical and social problems. One of the best known, the *Address to Young Men*, defends the study of pagan literature by Christians (Basil himself made considerable critical use of Greek philosophical thought). In the *Hexaëmeron* ("Six Days"), nine Lenten sermons on the days of creation, Basil speaks of the varied beauty of the world as reflecting the splendour of God. *Against Eunomius* defends the deity of the Son against an extreme Arian thinker, and *On the Holy Spirit* expounds the deity of the spirit implied in the church's tradition, though not previously formally defined. Basil is most characteristically revealed in his letters, of which more than 300 are preserved. Many deal with daily activities; others are, in effect, short treatises on theology or ethics; several of his *Canonical Epistles*, decisions on points of discipline, have become part of the canon law of the Eastern Orthodox Church. The extent of Basil's actual contribution to the magnificent series of eucharistic prayers known as the *Liturgy of St. Basil* is uncertain. But at least the central prayer of consecration (setting apart the bread and wine) reflects his spirit and was probably in use at Caesarea in his own lifetime.

Basil's health was poor, perhaps because of the rigours of his ascetic life. He died soon after Valens' death in the Battle of Adrianople had opened the way for the victory of Basil's cause. Vigorous and firm and sure of his own position, in his own time he seems to have been admired rather than loved, even by his intimates. But he was widely mourned and was soon numbered among the saints.

(E.R.Ha.)

BIBLIOGRAPHY. The Benedictine edition of Basil's works is reprinted in J.P. Migne (ed.), *Patrologia Graeca*, vol. 29–32 (1857). There are modern editions in *Sources Chrétiennes* of *On the Holy Spirit*, 2nd ed. by B. Pruche, vol. 17 (1968); and the *Hexaëmeron*, 2nd ed. by S. Giet, vol. 26 (1968), with French translations; and of the

Basil, Colonel W. de, original name VASILY GRIGORIEVICH VOSKRESENSKY (b. 1888, Kaunas, Lithuania, Russian Empire—d. July 27, 1951, Paris), Russian impresario who in 1932 became codirector with René Blum of the Ballet Russe de Monte Carlo. He lost the celebrated premier danseur Léonide Massine and several other dancers to Blum, who, with a U.S. sponsoring agency (World Art), reorganized the Ballet Russe de Monte Carlo with Massine as director. De Basil then formed a troupe with dancers who did not go over to Massine and called it the Original Ballet Russe, managing it until it dispersed (1948).

Basil, Liturgy of Saint, a eucharistic service used by Eastern Orthodox and Eastern-rite Catholic churches 10 times during the year: January 1 (the feast of St. Basil), the first five Sundays in Lent, Holy Thursday, Holy Saturday, Christmas Eve, and the Eve of the Epiphany (unless Christmas or the Epiphany falls on Sunday or Monday).

The Liturgy of St. Basil, of which two versions—the Alexandrian and the somewhat longer Byzantine—are extant, was probably authored, in part at least, by St. Basil himself. Except for the anaphora (the central part of the liturgy), it is identical with the Liturgy of St. John Chrysostom, which is a shortened form in daily use.

Basilan, island, province, and chartered city, southern Philippines, in the Celebes Sea. Basilan island lies 5 mi (8 km) off the southern tip of the Zamboanga Peninsula of Mindanao, across the Basilan Strait. It is the largest (495 sq mi [1,282 sq km]) and northernmost island of the Sulu Archipelago. Most of the island consists of rugged or rolling forested uplands with several volcanic peaks exceeding heights of 2,000 ft (600 m). Short streams provide a roughly radial pattern of drainage. Since

Letters and Address to Young Men in the *Loeb Classical Library*; the *Hexaëmeron* and *Letters* are in *Nicene and Post-Nicene Fathers*, ser. 2, vol. 8 (1895), trans. by Blomfield Jackson. *The Ascetic Works* was translated by W.K.L. Clarke (1925).

The basic source for the life of St. Basil is the eulogy by Gregory of Nazianzus (Oration 43). E. Venables, "Basilus of Caesarea," in *Dictionary of Christian Biography*, vol. 1, pp. 282–297 (1877), is still important. Among modern sketches, see J. Quasten, "Basil the Great," in *Patrology*, vol. 3, pp. 204–235 (1960), with bibliography; J.W.C. Wand in *Doctors and Councils*, pp. 31–46 (1962); and Hans von Campenhausen in *The Fathers of the Greek Church*, pp. 84–100 (1963).

about 1900, lumber mills have operated in the tropical rain forest. The island's gentle, rolling slopes and its valleys have fertile soils and are largely under plantation agriculture. Rubber, the primary crop, is processed on the plantations and sold to Manila factories.

The inhabitants are Yakans, descendants of early Papuan settlers who were converted to Islam during the 14th century. Their culture includes many non-Muslim beliefs and customs. Unlike the Muslims of Jolo and Zamboanga, they are not beach dwellers and fishermen but live on higher lands and cultivate coconuts, rice, corn (maize), abaca, and coffee. In the

20th century, as more land was cleared by timber extraction, Christian Filipinos, mainly from the Visayan Islands, migrated to Basilan in considerable numbers. The University of the Philippines (at Diliman, Quezon City) owns a 10,000-ac (4,000-ha) land grant on the northern coast.

Basilan province has an area of 512 sq mi. In addition to Basilan Island, it includes several nearby small isles. Until 1973 the area was a part of Zamboanga del Sur province. The provincial capital is Isabela (also called Basilan City). Other important towns include Lamitan, in the north of Basilan Island, and Maluso, in the west. The province was one of the centres of the 1972 Muslim rebellion in southern Mindanao.

Basilan City is the headquarters of the Menzi Agricultural Corporation, which operates harvesting and processing facilities for the surrounding agricultural region. Important products include rubber latex, palm oil, and coffee. Pop. (2000 prelim.) province, 326,000; (1990) Isabela (Basilan City), 59,482.

Basildon, district, county of Essex, England, about 25 mi (40 km) east of central London. After World War I many Londoners settled in the Billericay area of Essex, forming what became known as "rural slum" villages. The district, with an area of 43 sq mi (111 sq km), includes Billericay and Wickford as well as the new town of Basildon, so designated in 1949. Main industries are light engineering, chemicals, clothing, and printing. Pop. (1998 est.) 164,400.

Basildon, new town. Basildon district, county of Essex, England. Basildon new town was established in 1949. It was one of eight established 20 to 30 mi (32 to 48 km) from central London to help alleviate the city's acute post-World War II housing shortage. More than 230 factories have been built and nearly 400 shops, with more than 200 in the town centre. An ultimate population of 130,000 is planned. Basildon district occupies 43 sq mi (110 sq km). Pop. (1991) 100,924.

Basile, Giambattista (b. c. 1575, Naples—d. Feb. 23, 1632, Giugliano, Campania). Neapolitan soldier, public official, poet, and short-story writer whose *Lo cunto de li cunti*, 50 zestful tales written in Neapolitan, was one of the earliest such collections based on folktales and served as an important source both for the later fairy-tale writers Charles Perrault in France in the 17th century and the brothers Grimm in Germany in the 19th century, and for the Italian commedia dell'arte dramatist Carlo Gozzi in the 18th century.

Basile was a soldier as a young man and began a career in government after moving to Naples in 1608. He later was part of the Mantuan court of Ferdinando Gonzaga, and then moved on to become governor, successively, of several small Italian states.

Basile was most at home in Naples, and during his career he became fascinated with the folklore, customs, literature, music, and dialect of the Neapolitan people. He began serious study of things Neapolitan and began to collect fairy tales and folktales, setting them down in a lively Neapolitan style with much local flavour and all the ornament and flamboyance of his influential contemporary Giambattista Marino.

Basile's collection, *Lo cunto de li cunti* (1634; "The Story of Stories"; best Italian translation B. Croce, 1925; best English translation N.B. Penzer, *The Pentamerone*, 2 vol., 1932), was published posthumously under the anagrammatic pseudonym Gian Alesio Abbattutis and referred to by its first editor as *Il pentamerone*

because of the similarity of its framework to that of Boccaccio's *Decameron*.

In *Lo cunto de li cunti*, a prince and his wife, a slave who has been posing as a princess, are entertained for 5 days by 10 women, who tell them 50 stories, among which are the familiar tales of Puss in Boots, Rapunzel, Cinderella, Snow White and Rose Red, the Three Oranges, and Beauty and the Beast. On the last day of storytelling, the real princess appears, tells her story, and ousts the deceptive slave.

Basile also wrote Italian and Spanish verse. *Le muse napoletane* (1635) was a series of satirical verse dialogues on Neapolitan mores.

Basileios (Greek personal name): see under Basil.

Basilian, member of any of several Christian monastic communities of the Byzantine Rite, so named because they claim St. Basil the Great as their spiritual father. (The Basilians is also the name of a Latin-rite congregation founded in France in 1822 and later active mainly in Canada, its members devoting themselves to the education of youth.)

St. Basil, theologian and archbishop of Caesarea in Cappadocia (modern Turkey), set down his monastic rule between 358 and 364, and possibly was influenced by the monasteries founded by St. Pachomius of the Thebaid. St. Basil's rule was simple but strict and called for his followers to live a life in common (cenobitism), in contrast to the followers of both St. Anthony of Egypt and St. Pachomius. Basil carefully avoided the extreme asceticism of the desert hermits. His rule, found in two forms, *Regulae fusiis tractatae* (55 items) and *Regulae brevius tractatae* (313 items), follows a question-and-answer form and encourages ascetic practices as a means to the perfect service of God. The rule calls for community living under obedience with hours of liturgi-

the 17th and 18th centuries, its special interest was the union of the Ukrainian and Roman churches. Reformed by Pope Leo XIII, these Basilians spread into Galicia, Ruthenia, Yugoslavia, and Romania and then followed immigrants into the United States, Canada, and Latin America. The present name dates from 1932. (3) St. Savior in the Melchite Rite was founded by the Archbishop of Tyre and Sidon in 1684 and placed under the rule of Basil in 1743. Members engaged in parochial ministry in Lebanon, Palestine, Egypt, and the city of Damascus prior to 1832. The Vatican approved their constitution in 1955, and they now have foundations in the United States as well. (4) The Basilian Order of St. John the Baptist, also known as the Order of Suwayr, or the Baladites, was founded in 1712 and added the vow of humility to the usual vows. Its motherhouse is in Lebanon, and the Vatican set its canonical status in 1955. (5) The Basilian Order of Aleppo separated from the preceding group in 1829 and was approved by the Vatican in 1832, with headquarters in Lebanon.

basilica, in the Roman Catholic and Greek Orthodox churches, a canonical title of honour given to church buildings that are distinguished either by their antiquity or by their role as international centres of worship because of their association with a major saint, an important historical event, or, in the Orthodox Church, a national patriarch. The title gives the church certain privileges, principally the right to reserve its high altar for the pope, a cardinal, or a patriarch, and special penitential privileges that remove the basilica from local geographical jurisdiction and give it international status.

Plan of the basilican church of S. Clemente, Rome (1099-1108): (A) entrance, (B) narthex, (C) chapels, (D) ambos, (E) cathedra, (F) cancelli, (G) apse, (X) altars

cal prayer and with manual as well as mental work. Basil's rule implied vows of chastity and poverty, similar to those set down in Western monasticism at a later time. Basil also called for children to be trained in schools attached to the monastery, along with opportunities for testing the students' possible vocations to the religious life. The monks also were advised to take care of the poor. St. Theodore of Studios revised the rule of Basil in the 9th century.

Over the centuries, the Rule of St. Basil has wielded enormous influence in the Byzantine world and is comparable to St. Benedict's influence in Western monasticism. Among the best known Basilians are Cyril and Methodius, the apostles to the Slavic nations; St. John Damascene; and Maximus Confessor.

There are five major branches of the Order of St. Basil in the Byzantine Rite: (1) Grottaferrata in the Italo-Albanian Rite was restored in 1880 in its Greek traditions and controls monasteries in southern Italy and Sicily. Grottaferrata was once famous for creating religious art and illumination and for copying manuscripts. (2) St. Josaphat in the Ukrainian and Romanian Rite was introduced in Kiev in 1072 by St. Theodosius and became the model for the Ukrainian, White Russian, and Russian monasteries. In

In architecture, "basilica" in its earliest usage designated any number of large roofed public buildings in ancient Rome and pre-Christian Italy, markets, courthouses, covered promenades, and meeting halls. Gradually, however, the word became limited to buildings of a more or less definite form: rectangular walled structures with an open hall extending from end to end, usually flanked by side aisles set off by colonnades (in large buildings often running entirely around the central area), and with a raised platform at one or both ends. During the 1st century BC, when basilicas were increasingly used for judicial purposes, the raised platform became enclosed by an apse, or semicircular half-domed protrusion of the end wall, to accommodate the magistrate. The foundations of a number of very large basilicas have been excavated at several sites in Italy. The most impressive remains, however, are those of a basilica begun by Emperor Maxentius in the early 4th century AD in Rome and finished by his successor, Constantine the Great.

One type of smaller secular basilica had side aisles extending the length of the sides only and an apse at one end. It was this type that the early Christians adopted for their churches, possibly because similar halls in large private

houses had been used for Christian worship before the religion was officially recognized by the Roman emperor Constantine in 313. Constantine himself commissioned the construction of three enormous Christian basilicas in Rome: St. Peter's, S. Paolo Fuori le Mura, and S. Giovanni in Laterano. He added a new feature, the transept, a lateral aisle crossing the nave just before the apse, and thus created the cross-shaped plan that became standard for churches in western Europe throughout the Middle Ages.

In the typical Early Christian basilica, the columns separating the nave from the side aisles carried either arches or an entablature (straight band of molding), and above these was a blank wall supporting the timber roof of the nave. Because the nave rose considerably higher than the side aisles, the wall that supported the nave roof stood above the level of the side aisle roofs and could thus be pierced at the top with windows to light the centre of the church. This high nave wall is called the clerestory. The side aisles themselves were either single or double. The apse opened from the nave by a great arch known as the triumphal arch. In some cases, if there was a transept, another triumphal arch separated the transept from the nave. At the entrance end a narthex, or vestibule, extended the entire width of the nave and aisles. This narthex was commonly fronted by a colonnade and, in many cases, opened onto a court surrounded by either colonnades or arcades. After the 10th century a round or square campanile, or bell tower, was added.

The exterior of such a building was simple and was rarely decorated. The simplicity of the interior, however, provided surfaces suitable for elaborate ornamentation.

Although the basilica is primarily characteristic of Rome, there are many examples elsewhere. The 5th-century church of St. Demetrius at Thessalonica, Greece, and the 6th-century churches of S. Apollinare Nuovo and S. Apollinare in Classe, both at Ravenna, are particularly noteworthy examples. The basilica plan, with its nave, aisles, and apse, remained the basis for church building in the Western Church. It gradually passed out of use in the Eastern Church, however, eclipsed by the radial plan on which the emperor Justinian I constructed the domed cathedral of Hagia Sophia at Constantinople.

Basilica (from Greek *basilikos*, "imperial"), 9th-century Byzantine code of law initiated by the emperor Basil I and completed after the accession of his son Leo VI the Wise.

The Justinian code of the 6th century, augmented by later imperial ordinances, had been the chief law source for the Roman world but was marred by much internal repetitiveness and inconsistency. Conflicting interpretations on how to select and apply elements of Justinian's works had contributed to uncertainty among imperial judges. Emperors Basil and Leo therefore had a commission of lawyers re-examine the code in order to abridge it, to cast out obsolescent, conflicting, and superfluous items, and to arrange the resultant provisions into orderly single titles. Basil's jurists apparently produced 40 books, which were enlarged to 60 under Leo.

The Basilica was written in Greek and was as much a collection of canon law as of civil and public law. It was far more systematically arranged than Justinian's code and comprised a single integrated work, unlike Justinian's four works, in which one subject might be treated in various places. The Basilica became the foundation of Byzantine jurisprudence.

In the 12th century an index for the Basilica was compiled. Because only about two-thirds of the Basilica survives, the index aids in

rounding out knowledge of the contents. See also Justinian, Code of.

Basilica of Constantine (Rome): see Maxentius, Basilica of.

Basilicata, region, southern Italy, along the Golfo di Taranto (Gulf of Taranto), consisting of the provinces of Potenza and Matera, with a total area of 3,858 sq mi (9,992 sq km). Bounded by the regions of Puglia (north and east), Calabria (south), and Campania (west), Basilicata is roughly divided into a western mountainous section, dominated by the Appennino Lucano, and an eastern section of low hills and wide valleys, while along the Ionian Sea the sand and clay hills overlook narrow coastal plains. The extinct volcano of Monte Vulture (4,350 ft [1,326 m]) stands isolated from the Apennines in the north.

Known in ancient times as Lucania (*q.v.*), the region was under Lombard rule in the early Middle Ages. It was controlled by the dukes of Benevento and then by the princes of Salerno. After an interval of Byzantine control, the Normans took over and made Melfi (*q.v.*) the capital of one of their dominions. Until the fall of the Swabian Hohenstaufens (1254), Basilicata played a significant part in the affairs of southern Italy; afterward, passing through Angevin and Spanish hands, it followed the variable fortunes of the Kingdom of Naples until united with Italy in 1860. The region was coextensive with Potenza province until the establishment of Matera province in 1927.

The mainstay of the economy is agriculture, but yields are generally low because of poor soil and the rugged terrain. Crops include wheat, rye, grapes, and olives; sheep, goats, pigs, and an increasing number of beef and dairy cattle are raised. New crops introduced in the eastern and coastal areas include tobacco, vegetables, sugar beets, and flowers. Industry is virtually nonexistent except for olive presses and flour mills, although natural gas has been discovered near Matera and there is a chemical plant at Pisticci. Potenza (*q.v.*), the regional capital, and Matera (*q.v.*) are the only sizable cities. The region suffered severe damage in a disastrous earthquake in 1980. The main railroad line of Basilicata links Potenza with Naples and Battipaglia in the northwest and with Taranto in the east, connecting also with the Ionian railroad (Taranto-Reggio di Calabria). Pop. (1983 est.) 612,785.

Basilide (Ethiopian emperor): see Fasilides.

Basilides (fl. 2nd century AD, Alexandria), scholar and teacher, who founded a school of Gnosticism known as the Basilidians. He probably was a pupil of Menander in Antioch, and he was teaching in Alexandria at the time of the Roman emperors Hadrian and Antoninus Pius.

Clement of Alexandria, a Christian theologian of the 3rd century AD, wrote that Basilides claimed to have received a secret tradition—on which he apparently based his gnosis, or esoteric knowledge—from Glaucias, an interpreter of the Apostle Peter. In addition to psalms and odes, Basilides wrote commentaries on the Gospels and also compiled a "gospel" for his own sect; only fragments of these writings have been preserved. Contradictory accounts of Basilides' theology have been provided by Clement, as well as by the theologians Hippolytus of Rome and Saint Irenaeus. While interpreters cite elements of Neoplatonism, the New Testament, and other Gnostic systems, description of the Basilidian system of belief remains incomplete.

Basilides was succeeded by his son, Isidore, and the Basilidian school still existed in Egypt in the 4th century. Its followers were the first to keep the day of Jesus' baptism on January 6 or 10, celebrating it with an all-night vigil.

Basilio da Gama: see Gama, Basilio da.

Basilios, also spelled **BASILOS** (b. 1891?—d. Oct. 12, 1970, Addis Ababa, Ethiopia?), religious leader who, on Jan. 14, 1951, became the first Ethiopian bishop to be consecrated *abuna*, or primate, of the Ethiopian Orthodox Church. From the 4th century the Ethiopian Church was headed by Egyptian *abunas* appointed by the Alexandrian patriarch of the Coptic Church. As the result of reforms negotiated under Emperor Haile Selassie I, however, the Ethiopian Orthodox Church began in the late 1940s to gain independence. Following Basilios' consecration, the church achieved completely indigenous leadership by 1954. In 1959 it became an autocephalous (ecclesiastically independent) body, and Basilios was made its first patriarch.

Basiliscus (d. 477), usurping Eastern Roman emperor from 475 to 476. He was the brother of Verina, wife of the Eastern emperor Leo I (ruled 457–474).

In 468 Basiliscus was given supreme command of a vast Eastern Roman force that sought to expel the Vandals from Africa. When his incompetent leadership led to total defeat at the hands of the Vandal king Gaiseric off Mercurius (modern Cap Bon, Tunisia), Verina procured the Emperor's pardon for her brother. In January 475 Basiliscus executed a coup d'état, which drove the new Eastern emperor, Zeno, from Constantinople. For the next 20 months Basiliscus held the power in the East. As emperor he stirred up discontent because he favoured the Monophysite heresy, which held that the human and divine elements in Christ's nature were inseparable. During his reign a disastrous fire in Constantinople destroyed much of the city along with many Greek works of art. When Zeno returned to the capital in August 476, Basiliscus was exiled to Cappadocia and there beheaded.

basilisk (legendary serpent): see cockatrice.

basilisk (*Basiliscus*), any of four species of lizards belonging to the family Iguanidae. The name is applied because of a resemblance to the legendary monster called basilisk.

Basilisks are found in trees near the rivers and streams of tropical America. The body is compressed from side to side, the tail is long and whiplike, and the rear of the head is extended into a flat lobe like a cock's comb. The outer edges of the toes have a wide fringe

Basilisk (*Basiliscus basiliscus*)

Dade Thornton—The National Audubon Society Collection/Photo Researchers

of elongated scales. Males have a crest along the back, as deep as the body in two species. Basilisks can run across the surface of water on their hind limbs, the body being held almost upright.

Basilios THE GREAT, SAINT: see Basil the Great, Saint.

Basilosaurus, also called **ZEUGLON**, extinct genus of primitive whales of the family Basilosauridae (suborder Archaeoceti) found in upper Eocene rocks in North America and northern Africa (the Eocene Epoch began about 54,000,000 years ago and lasted about 16,000,000 years). *Basilosaurus* had primitive dentition and skull architecture; the rest of the slender, elongated skeleton was well adapted

to aquatic life. It attained a length of about 21 m (about 70 feet), with the skull alone as much as 1.5 m (5 feet) long. *Basilosaurus* was common throughout late Eocene seas.

Basin, Thomas (b. 1412, Caudebec, France—d. Dec. 3, 1491, Utrecht [now in The Netherlands]), French bishop and historian.

After studying liberal arts at Paris and law at Pavia and Louvain, Basin took part in the Council of Basel before returning to teach canon law at Caen. In 1447 he became bishop of Lisieux. After the French recovery of Normandy from the English (1450), he served Charles VII of France faithfully and was appointed one of the royal counselors. His refusal to support the revolt of the dauphin Louis was a cause of the latter's animosity toward him when Louis finally became king (1461). Basin went into exile and renounced his bishopric.

Basin's principal work, a history of the reigns of Charles VII and Louis XI, was written in Latin between 1471 and 1487 in a style imitating that of ancient classical historians. It is a valuable testimony on his times but is marred to some extent by his dislike of Louis XI.

Basin and Range Province, arid physiographic province occupying much of the western and southwestern part of the United States. The region comprises almost all of Nevada, the western half of Utah, southeastern California, and the southern part of Arizona and extends into northwestern Mexico. The province has a varied and remarkable topography consisting largely of numerous small, roughly parallel mountain ranges (trending north-south) separated by nearly flat desert plains, or basins. The basins are generally 4,000–5,000 feet (1,200–1,500 m) above sea level, and the mountain ranges rise 3,000–5,000 feet above the level of the basins.

The northern half of the province is called the Great Basin (*q.v.*). The Sonoran Desert (*q.v.*) section extends into Sonora, Mexico, while the Salton Trough extends to the Gulf of California; the Salton Trough is a concave desert basin that descends to 235 feet (72 m) below sea level at the Salton Sea. East of the Sonoran Desert and extending southward from the Colorado Plateau is the Mexican Highland section, which has many of the characteristics of the Great Basin and which covers parts of New Mexico, Arizona, and northern Mexico. To the east of this, the narrow, varied Sacramento section, in New Mexico and western Texas, is a plateau with blocks of eastward-dipping mountains.

The Basin and Range is a semidesert area with an extremely complex geologic history. Its 100 or so mountain ranges are the remains of crustal rocks that were upraised or uplifted by faulting along north-south lines, after which the resulting blocks were tumbled, eroded, and partly buried by alluvial debris that had accumulated in the desert basins at their feet. Death Valley in California is the lowest of these sediment-filled basins. Most of the basins have no outlets for their drainage, and thus rainwater accumulates in the form of salt lakes (*e.g.*, Walker and Pyramid lakes in Nevada and the Great Salt Lake of Utah) or in playas, which are mud flats occasionally covered by a few inches of rapidly evaporating water. In the southern part of the Basin and Range the intermontane basins are connected by through drainage that contributes to the flow of the lower Colorado River.

Basingstoke and Deane, borough and district, county of Hampshire, Eng., west-southwest of London. The borough is largely rural but includes the market town of Basingstoke. Its 17th-century cloth industry has been reestablished, and it has a wide range of light industries. It has been designated for planned expansion to accommodate overspill popula-

tion from Greater London. Cereal production is important in the countryside. Area 245 square miles (634 square km). Pop. (1992 est.) 146,000.

Basirhāt, city, southeastern West Bengal state, northeastern India. Basirhāt lies just south of the Ichāmati (Upper Jamuna) River near the border with Bangladesh. Connected by road and rail with Bārāsāt, it is a major trade depot for the rice, jute, mustard, legumes, dates, and potatoes produced in the surrounding agricultural area. Sugar milling and metalware manufacture are the chief industries. Basirhāt has a college affiliated with the University of Calcutta. It was constituted a municipality in 1869. Pop. (1991) 101,409.

Baskerville, John (b. Jan. 28, 1706, Wolverly, Worcestershire, Eng.—d. Jan. 8, 1775, Birmingham, Warwickshire), English printer and creator of a typeface of great distinction bearing his name, whose works are among the finest examples of the art of printing.

Baskerville became a writing master at Birmingham but in 1740 established a japanning (varnishing) business, whose profits enabled him to experiment in typefounding. He set up a printing house and in 1757 published his first work, an edition of Virgil, followed in 1758 by an edition of John Milton. Appointed

Baskerville, detail of a portrait after James Millar, 1774; in the National Portrait Gallery, London

printer to the University of Cambridge, he undertook an edition of the Bible (1763), which is considered his masterpiece. He published a particularly beautiful edition of Horace in 1762; the success of a second edition (1770) encouraged him to issue a series of editions of Latin authors.

The bold quality of Baskerville's print derived from his use of a highly glossed paper and a truly black ink that he had invented. His typography was much criticized in England, and after his death his types were purchased by the French dramatist Pierre-Augustin Caron de Beaumarchais. Their subsequent history is uncertain, but in 1917 the surviving punches and matrices were recognized, and in 1953 they were presented to the University of Cambridge. Baskerville type has been revived, its clarity and balance making it a good type for continuous reading.

basket-flower (*Centaurea americana*), annual garden flower of the family Asteraceae, native to southwestern North America. The basket-flower has oblong leaves and rose-coloured, compact heads of disk flowers that appear to be in baskets because the ray flowers around the head are enlarged. The name basket-flower also is used for a species of spider lily (*Hymenocallis*) of another family.

Other plants of the genus *Centaurea* also are cultivated as garden ornamentals, especially cornflower (*C. cyanus*), dusty miller (*C. cineraria*) and *C. gymnocarpa*, and sweet sultan (*C. moschata*). Knapweed (*C. nigra*) is

Basket-flower (*Centaurea americana*)

Europe, usually growing in thin, rocky soils. It forms a dense mat, low to the ground, and is often planted in rock gardens.

basketball, game played with an inflated ball between two teams of five players each on a rectangular court. Each team tries to score by tossing the ball through the opponent's goal, an elevated, horizontally mounted hoop and net called a basket.

A brief treatment of basketball follows. For full treatment, see MACROPAEDIA: Sports, Major Team and Individual.

Basketball was invented in 1891 by James Naismith, a physical education instructor at the Young Men's Christian Association Training School (now Springfield College) in Springfield, Mass., U.S. The game caught on quickly in the United States, and in 1896 the first college basketball game with five team members on a side was played at the University of Iowa.

Basketball games for women were organized around the same time, but with variant rules. During the 1930s several rules for the men's game were changed to speed up the game; *e.g.*, each team had 10 seconds in which to advance the ball beyond midcourt, and a player could not stand inside the opposing team's foul area (in front of the basket) for more than three seconds. The centre jump was eliminated, and the adoption of the one-hand shot led to higher scoring games. The presentation of college games at arenas in major cities contributed to the popularity of basketball as a spectator sport, and, with the inclusion of basketball in the Olympic Games in 1936, the game gained worldwide attention. An Olympic tournament for women was introduced in 1976. The Fédération Internationale de Basketball Amateur (FIBA) was organized in 1932 to govern the international game.

Organized American professional basketball began in 1898 with the creation of the National Basketball League (NBL). The Basketball Association of America, a second league, was organized in 1946, and in 1949 the two leagues were merged to form the National Basketball Association (NBA). A rival American Basketball Association (ABA) was set up in 1967 and was merged with the NBA in 1976.

During the latter part of the 20th century, professional women's leagues appeared in the United States and abroad, though few lasted more than a year or two. The Women's National Basketball Association (WNBA), backed by the NBA, debuted in 1997 and brought stability to the professional game.

American basketball courts are slightly larger than international courts and measure 50 feet wide by 94 feet long (15 m by 28 m). The ball is moved about the court by dribbling or by passing it to another player. A successful shot, or field goal, is worth two points or, when taken from beyond a specified distance (marked by a line) from the basket, three points. Fouls are caused by physical contact between players when one player puts another at a disadvantage. After certain fouls, play is momentarily interrupted and the fouled player is awarded one to three unhindered free throws, which are taken from beyond a line 15 feet (4.6 m) in front of the backboard to which the basket is attached; successful free throws are worth one point. A jump ball is held between two opposing players to begin the game. After a team scores, the other team brings the ball into play.

The major annual American basketball events are the NBA and the WNBA championships, and the National Collegiate Athletic Association championships for men and women.

See *Sporting Record: Basketball*. See also *Olympic Games*.

basketry, the art and craft of making interwoven objects, usually containers, from flexible vegetable fibres, such as twigs, grasses, osiers, bamboo, and rushes. The containers made by this method are called baskets.

A brief account of basketry follows. For full treatment, see *MACROPAEDIA: Decorative Arts and Furnishings*.

Basketry, on the whole, is a useful rather than a decorative art and has evolved to fulfill primarily utilitarian functions. Nevertheless, basketry has an aesthetic quality that is extremely varied and forms an important part of the art. Within the confines of the function of the object being made, the basket maker has considerable scope for artistic expression by means of colour, texture, pattern, form, and detail. Not all basketry products are receptacles or even exclusively useful objects. Mats such as the Japanese tatami mat, woven from flexible vegetable materials, are part of the art of basketry,

as are the decorative and ritual masks and shields found in Micronesia.

Basketry is distinguished from weaving in that, in most techniques of basketry (matting being a notable exception), the flexible fibres are usually interwoven with rigid ones. Even when only flexible fibres are used, they are frequently woven and intertwined in such a way as to produce a relatively rigid continuous surface, either flat or enclosed. The coiled forms of basketry begin with soft, flexible fibres that are plaited and coiled to form receptacles that emerge quite rigid, capable sometimes even of containing liquids. Woven baskets, by contrast, are usually composed of a rigid framework of willows, twigs, or similar materials around and through which flexible grasses or like fibres are twisted and woven.

The techniques of basketry are numerous and varied. The principal distinction is between coiled construction, in which a single fibre is formed into a spiral of coils, stitched together in some way, and noncoiled construction, which includes the woven types such as wattle, lattice, and matting. The type of work known as wickerwork is of the wattle type of construction, in which stiff standards (framing elements) are interwoven with flexible threads. Matting is closest to textile weaving in construction, and all the materials are, at the outset, relatively soft and flexible.

Baskets are used as domestic utensils or for storage of grains, nuts, or personal possessions. They are used for hunting and fishing, for winnowing grain, to transport people or objects, and for large- and small-scale storage. There are even types of boats—such as the coracle of Great Britain, balsa of Peru, and gufa of Mesopotamia—made with basketry frames.

Baskin, Leonard (b. Aug. 15, 1922, New Brunswick, N.J., U.S.—d. June 3, 2000, Northampton, Mass.), American sculptor and printmaker noted for his bleak but inpressive portrayals of the human figure.

Baskin, who decided at age 14 to become a sculptor, studied at New York University's School of Architecture and Allied Arts and at Yale University, where he also developed an

"Man with a Dead Bird," walnut sculpture by Leonard Baskin, 1951–56; in the Museum of Modern Art, New York City

By courtesy of the Museum of Modern Art, New York, A Conger Goodyear Fund

interest in printing. In 1942 he founded Gehenna Press, which published finely illustrated books that feature Baskin's art. During World War II, Baskin served in the U.S. Navy and after a stint with the Merchant Marine returned to New York, where he attended the New School for Social Research (B.A., 1949).

Baskin also studied in Paris and Florence. He taught at Smith College in Northampton, Mass. (1953–74), and at Hampshire College in Amherst (1984–94).

Inspired by ancient Egyptian and Greek art, Baskin designed monumental figures and reliefs in bronze, limestone, and wood. Among his subjects are poets ("Blake," 1955; "Barlach Dead," 1959), universal symbols ("Hanged Man," 1956; "Man with Owl," 1960), and biblical subjects ("Prodigal Son," 1976; "Ruth and Naomi," 1978). Baskin imbued his sculptures of the human figure with those qualities of spiritual death, decay, and vulnerability which to him were the condition of 20th-century man. His sculptures nevertheless possess a kind of forbidding authority. Baskin was particularly noted for his memorials, including the Holocaust Memorial (dedicated 1994) in Ann Arbor, Mich., which features a solitary seven-foot figure, seated and in anguish. In his woodcuts, such as "Man of Peace," Baskin developed a wiry and nervous linearity.

basking shark, huge, sluggish shark of the family Cetorhinidae, usually classified as *Cetorhinus maximus* but possibly separable into more than one distinct species. Named for its habit of floating or slowly swimming at the surface, the basking shark inhabits northern

Basking shark (*Cetorhinus maximus*)
Painting by Richard Ellis

and temperate regions of the Atlantic, Pacific, and Indian oceans. It is a giant, growing as long as 14 m (46 feet), and is exceeded in size among fishes only by the whale shark. Despite its size, the basking shark feeds on plankton. It is a gray-brown or blackish shark, with tiny teeth and very long gill slits. It is hunted sporadically for fish meal and liver oil.

Basle (Switzerland): see *Basel*.

Basmachi Revolt, Russian *BASMACHESTVO*, insurrection against Soviet rule in Central Asia, begun in 1917 and largely suppressed by 1926. An amalgam of Muslim traditionalists and common bandits, the Basmachi were soon widespread over most of Turkistan, much of which was under regimes independent of but allied to Soviet Russia.

In the early 1920s the revolt threatened the Soviet government with the permanent loss of much of Turkistan. But the Bolsheviks enjoyed military superiority, greater discipline, and a singleness of purpose. The Basmachi, on the other hand, were nearly as inclined to attack each other as to fight their common foe. By conciliating nationalist sentiment in Central Asia, the Soviet government defused the revolt and paved the way for successful incorporation of the area into the Soviet Union.

basmalah, also called *TASMIYAH*, in Islām, the formula-prayer: *bī'sm Allāh ar-rahmān ar-rahīm*, "in the name of God, the Merciful, the Compassionate." This invocation, which was first introduced by the Qur'an, appears at the beginning of every Qur'anic *sūrah* (chapter) except the ninth (which presents a unique textual problem) and is frequently recited by Muslims to elicit God's blessings on their important actions. The *basmalah* also introduces all formal documents and transactions and must always preface actions that are legally required or recommended. An abbreviated version precedes certain daily rituals,

such as meals. Magicians often use the *bas-malah* in amulets, claiming that the prayer was inscribed in Adam's side, Gabriel's wing, Solomon's seal, and Jesus Christ's tongue.

Basohli painting, school of Pahari miniature painting that flourished in the Indian hill states during the late 17th and the 18th centuries, known for its bold vitality of colour and line. Though the school takes its name from the small independent state of Basohli, the principal centre of the style, examples are found throughout the region.

The origins of the school are obscure; one of the earliest examples so far discovered, a series of illustrations to the *Rasamañjari* (c. 1690), exhibits a style already completely formed. An oblong format is favoured, with the picture space usually delineated by architectural detail, which often breaks into the characteristic red borders.

A musical mode, Basohli miniature painting, early 18th century; in a private collection

P Chandra

The stylized facial type, shown in profile, is dominated by the large, intense eye. The colours are always brilliant, with ochre yellow, brown, and green grounds predominating. A distinctive technique is the depiction of jewelry by thick, raised drops of white paint, with particles of green beetles' wings used to represent emeralds.

Basov, Nikolay Gennadiyevich (b. Dec. 14, 1922, Leningrad), Soviet physicist, winner of the Nobel Prize for Physics in 1964, with Aleksandr Mikhaylovich Prokhorov of the Soviet Union and Charles H. Townes of the United States, for basic research in quantum electronics that led to the development of both the maser and the laser. These devices produce monochromatic, parallel, coherent beams of microwaves and light, respectively.

Basov graduated from the Moscow Engineering Physics Institute in 1950. In that year he began working in the Institute of Physics of the Academy of Sciences of the U.S.S.R. From 1962 he headed the institute. In 1952 he and Prokhorov suggested the maser principle, for which they were awarded the Lenin Prize in 1959.

Basque, Spanish *VASCO*, or *VASCONGADO*, Basque *EUSKALDUNAK*, or *EUSKOTARAK*, member of a people who live in both Spain and France in areas bordering the Bay of Biscay and encompassing the western foothills of the Pyrenees Mountains. In the late 20th century probably about 850,000 true Basques

Basque shepherds, Navarra, Spain

Koldo Chamorro—Ostman Agency

lived in Spain and 130,000 in France; as many as 170,000 Basques may live in emigrant communities outside Europe, mostly in South America and the United States. In Spain their home is the *comunidad autónoma* ("autonomous community") of the Basque Country, which includes the *provincias* of Álava, Guipúzcoa, and Vizcaya (Biscay); there are also some Basques in Navarra (Navarre). In France, Basques are the chief element of the population in the *département* of Pyrénées-Atlantiques; the area mainly occupied by Basques is called informally the Pays Basque (Basque Country). In physique the Basques are not notably different from the other peoples of western Europe; their language, however, is not Indo-European (see Basque language).

The land inhabited by the Basques has a mild and damp climate and is largely hilly and wooded. It contains mines of iron ore, which early on favoured the development of industries, particularly shipbuilding. The Basques traditionally farmed small holdings of bottom land and carefully tended slopes of grass, which they cut by hand and fed to stabled cows. Apple orchards and mountainous sheep pastures were also important to their economy. The farmhouses are loosely grouped into villages or are scattered over the lower slopes. The household (including buildings, farm, and family) was an entity of great permanence that was formerly defended by a traditional law of inheritance which ensured the descent of the property intact to a single heir or heiress. Traditional Basque culture therefore revolved around this individual farmstead, called the *caserío*, the isolation of which resulted in a strong sense of family kinship among its occupants.

Besides being farmers of small acreages and shipbuilders, the Basques were traditionally seafarers. Basques played a leading part in the colonization of the New World, sailing with the conquistadors and being among the first to exploit the whaling grounds of the Bay of Biscay and the cod fisheries off Newfoundland. The Basques' ethnic solidarity and their position astride the Franco-Spanish frontier also made smuggling one of their traditional occupations. The Basques have a strong allegiance to Roman Catholicism. They were not converted to Christianity until the 10th century, however, and, although they are now among the most observant of Spanish Catholics, animism survives in their folklore.

Traditional Basque culture has declined with the pronounced urban and industrial development of the region, and emigration to France and the Americas has sharply reduced the population living in *caseríos*. In most of the larger industrial towns, not only Basque customs but also the Basque language tend to be lost. Basque is still spoken in remote inland mountain areas, but in the late 20th century, virtually all Basques spoke French or Spanish, whether or not they spoke Basque.

The early history of the Basques remains a subject for speculation, but Roman authors record the presence of the tribe of Vascones in lands corresponding roughly to the province of Navarra. They appear to have resisted the Visigoths, the Franks, the Normans, and, on

occasion, the Moors, who occupied the valley of the Ebro. It was the Basques, not the Moors, as the *Chanson de Roland* relates, who cut the rear guard of Charlemagne's army to pieces at the Battle of Roncesvalles in AD 778. The territories of the Basques had been incorporated into the kingdom of Navarre by the 10th century, and by the end of the political turmoil of the Middle Ages, the provinces of Álava, Biscay, and Guipúzcoa had become united with Castile and Aragon. However, in both Spain and France the Basques retained a large measure of local autonomy and privileges in matters of trade, taxation, and military service. These privileges were incorporated in bodies of traditional Basque law known as the *fueros*, or *fors*, which determined the rights of the Basques' popular assemblies and their rules of inheritance. The Basques showed a fierce attachment to their autonomous status, and in Spain the state's attempts to encroach upon their local privileges prompted the Basques in the 1830s to support the cause of Don Carlos, the conservative pretender to the Spanish throne, with disastrous results. They similarly supported the unsuccessful Carlist rebellion of the 1870s, and as a punishment the government finally abolished the *fueros*, though the Basques managed to retain some degree of local autonomy.

The advent of the Spanish Republic in 1931 divided the political aspirations of the Basques: Guipúzcoa, Vizcaya, and, to a certain extent, Álava were prepared to work for a status of relative autonomy within the republic, and for this reason they remained loyal to it in spite of its anti-Catholic policy. Navarra, on the other hand, was eager to see the republic overthrown and furnished one of the strong points of the Nationalist rebellion in 1936 and some of its best Carlist troops. The city of Bilbao, which had always been a stronghold of liberalism against the Carlists, became at the same time the centre of republican government and also of Basque nationalism. The fighting lasted until September 1937 and outside Spain is chiefly remembered for the bombing, supposedly by German aircraft, of Guernica, the traditional assembly place of the *provincia* of Vizcaya and a symbol of the Basque nation in Nationalist eyes. After the war, many Basques went into exile as Francisco Franco's government abolished the Basques' special privileges.

After the death of Franco and especially after the establishment of the liberal Spanish monarchy in 1975, the Basques engaged in vigorous demonstrations for local autonomy, which the Spanish government granted in some measure in 1978-79. The increased freedoms and home rule, however, did not satisfy the more militant separatists, such as the hard-line "military" wing of the Euzkadi Ta Azkatasuna (ETA; Basque for "Basque Homeland and Liberty"), a terrorist liberation organization seeking Basque self-determination and secession from Spain. The Basques thus continued on an unsettled course in their relations with the dominant Spaniards.

Basque Country, French *PAYS BASQUE*, cultural region within the *département* of Pyrénées-Atlantiques, extreme southwestern France, bordering the western Pyrenees Mountains where they adjoin the Basque *provincias* of Spain, along the Bay of Biscay. The region extends from the Anie Peak of the Pyrenees to the magnificent rock-bound coast around Biarritz and Saint-Jean-de-Luz on the Bay of Biscay. The climate is very wet, rainfall exceeding 120 inches (3,000 mm) per year in the mountains, and numerous rivers divide the landscape into countless verdant valleys that support both agriculture and forestry. The Basque people themselves speak a language that is among the oldest in Europe. The

Basques are ethnically distinct from the peoples who surround them in France and Spain, having preserved their identity among the waves of migrants who have passed through the region since prehistoric times. Fishing and tourism are the economic mainstays of a coast known for the sweetness of its climate. The region has been largely spared from the problems associated with the Basque separatist movement in the Basque *provincias* of Spain and has provided a refuge for exiles of that and other conflicts in Spain.

Basque Country, Spanish PAÍS VASCO, Basque EUSKARDI, *comunidad autónoma* ("autonomous community") and historic region of northern Spain encompassing the *provincias* of Álava, Guipúzcoa, and Biscay (Vizcaya) and established by the statute of autonomy of 1979. The capital is Vitoria (Gasteiz).

Rocky outcrop and church (lower right) in the Pyrenees, Basque Country
Arthur Tress/Photo Researchers

The Basque Country borders the Bay of Biscay to the north. The Pyrenees Mountains separate the region from the Basque Country (*q.v.*) of France to the northeast; however, the ethnically similar autonomous community of Navarre, which adjoins the (Spanish) Basque Country on the east, makes up most of the border with the French Basque region. To the south and southwest lie the Ebro River basin, the autonomous community of La Rioja, and the Castilian *provincia* of Burgos. Cantabria is on the west. The mountains of Biscay and Guipúzcoa are formidably jagged, and the rivers are short and rapid, cutting sharp gorges through the mountains. Average annual precipitation reaches 47 inches (1,200 mm), exceeding 60 inches (1,500 mm) around San Sebastián and dropping to half that amount in the Ebro basin. An Atlantic climate prevails in the northeast, characterized by relatively heavy and regular precipitation. A sub-Mediterranean climate prevails in the southern intermontane basin of Álava.

The population of the Ebro River basin is concentrated in small communal nuclei surrounded by open fields and vineyards. The population of the Pyrenees, by contrast, is more widely dispersed and centres on the individual farmstead, the *caserío*, allowing for intensive cultivation of small plots in the mountains. The rapid industrialization of the region since the mid-19th century has caused such coastal cities as San Sebastián and Bilbao to grow at the expense of settlements in the hinterlands. Population density is highest along the coast: some four-fifths of the Basque population is concentrated in greater Bilbao.

Álava *provincia* presents an open landscape suitable for the cultivation of cereals and grapes. The Basques of the Pyrenees have traditionally been herders, although the introduction of crops from the Americas (corn [maize] and potatoes) has resulted in the expansion of cultivation since the early modern period. Álava remains the most agricultural of the Basque *provincias*, though its city, Vitoria,

has undergone considerable industrialization since the early 1950s.

Biscay and Guipúzcoa *provincias* are heavily industrialized, having exploited their extensive resources of iron and timber since the late Middle Ages. The Basque metallurgical industries are heavily concentrated in Bilbao and along the banks of the Nervión River. Outside Bilbao there are metallurgical, food-processing, and chemical industries, while the paper industry centres on Tolosa and the banks of the Oria River. Service industries are highly developed in the Basque Country; San Sebastián is a major resort city, and Bilbao is one of the leading financial centres of Spain.

The government of the autonomous community consists of a president and a parliament. Traditional Basque culture has declined with the urban and industrial development of the region. Basques have long sought autonomy. The separatist movement of the 1930s culminated in a statute of autonomy on Oct. 5, 1936. General Francisco Franco suppressed Basque separatism the following year; extremists in the movement subsequently launched a campaign of terrorism against the Spanish central government. Continued terrorist acts of the Euzkadi Ta Azkatasuna (ETA; Basque for "Basque Homeland and Liberty") have made Basque regionalism one of the most destabilizing forces in Spanish political life. Area 2,793 square miles (7,234 square km). Pop. (1994 est.) 2,075,561.

Basque language, Basque EUSKARA, a language spoken by a largely bilingual people called Basques, or Euskaldunak, living either in northern Navarre (Navarra) *comunidad autónoma* ("autonomous community") of the Basque Country (which includes the *provincias* of Guipúzcoa, Biscay [Vizcaya], and Álava) in Spain or in the western region of the French *département* of Pyrénées-Atlantiques. The French Basques have further subdivided the Basque area in France into the provinces of Soule, Basse-Navarre, and Labourd (Basque Zuberoa, Nafarroa Beherea, and Lapurdi), but these designations are not recognized by the French government. In all, the majority of Basque speakers are concentrated in a narrow area of approximately 10,000 square km (3,900 square miles).

A brief treatment of the Basque language follows. For full treatment, see MACROPAEDIA: Languages of the World: *Basque language*.

Basque has constantly struggled for survival against the more popular and widespread Spanish and French languages. In the pre-Christian era, the Basque country extended across the Pyrenees Mountains as far east as the Aran Valley in northeastern Spain, along the French border. During the Roman administration, however, the eastern Basque settlements were cut off from more populated Basque colonies to the west and were assimilated into Roman culture, abandoning the Basque language. In the Middle Ages, the influence of Basque, an unwritten language,

steadily declined when it could not compete against the influx of literary Latin and its successors, Navarrese Romance and Provençal. The advent of the first printed Basque book in 1545, however, initiated a literary tradition that continues to the present day.

Basque is the only remnant of the languages spoken in southwestern Europe before that region was Romanized. The origin of the Basque language remains a mystery. The German philologist Hugo Schuchardt (1842–1927) hypothesized that Basque had a genetic connection with the now-extinct Iberian and that both languages evolved from the Afro-Asiatic (formerly Hamito-Semitic) language group. The existence of a connection seems unlikely, however, since Basque and the Afro-Asiatic languages do not really share common linguistic characteristics. Basque is also linked with Caucasian, the ancient language spoken in the Caucasus region. Again, there are parallels between the two languages; but, without conclusive evidence of a tie, Basque remains a language without linguistic relatives.

The system of Basque speech sounds is interesting in opposing an apico-alveolar sibilant (*i.e.*, a Castilian-type *s*) to a predorsal one (*i.e.*, an English-type *s*), spelled *z* in Basque. Both have corresponding affricates, spelled *ts* and *tz*. Palatals, like English *sh* and *ch*, also exist in Basque; they are spelled *x* and *tx*. Furthermore, Basque has two vibrant phonemes: a flapped *r* and a trilled *rr*. Like the similar sounds in Spanish, they contrast only when occurring between vowels, but unlike in Spanish, neither of them can begin a word (as in, for example, *Erroma* 'Rome').

Basque is an almost purely suffixing language. Suffixes are used to indicate the function of nominals within a sentence: *Ijitoa Jonengatik dator elizara* 'The Gypsy is coming to church because of John,' where the suffix *-engatik* corresponds to the English phrase 'because of,' and the suffix *-ra* after the noun *eliza* 'church' matches the English preposition 'to.'

Because phrasal order is rather free, suffixes also serve to keep subject and object distinct. In the sentence *Jonek ijitoa dakar* 'John is bringing the Gypsy,' the subject (*Jon*) rather than the direct object (*ijitoa*) is marked by the suffix *-ek*. Basque has a special case form, the ergative, which marks the subject of a transitive verb. The direct object is left unmarked, and thus occurs in the same form as the subject of an intransitive verb: *ijitoa dator* 'the Gypsy is coming.'

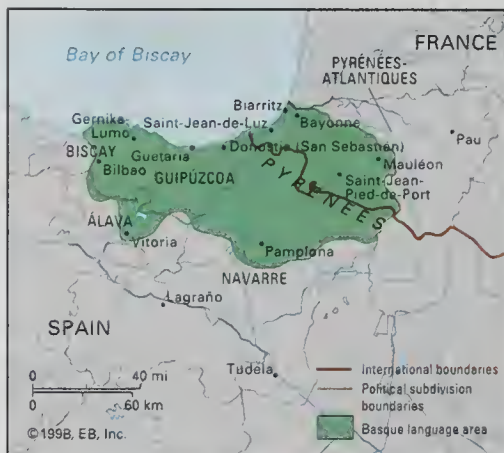

Finite verb forms can be quite complicated in that a single form may contain up to four person markers. The word *bazekarzkieon* 'I am bringing them to him' can form a sentence by itself and indicates, among other things, the presence of a first person singular subject (*-t*), third person plural direct object (*ze . . . -zki-*), third person singular indirect object (*-o-*), as well as a female addressee of the utterance (*-na-*).

The order of constituents within a clause is determined by pragmatic factors, with a topic position at the beginning of the sentence and a focus site immediately before the verb. The basic order appears to be subject–indirect object–direct object–verb, but this order is far from rigid, and, in fact, all 24 possible permutations can be found.

Relative clauses and genitive phrases precede the noun: *Jonen eliza* 'John's church,' whereas adjectives and demonstratives follow: *ijito eder hori* 'that beautiful Gypsy.'

Basque grammar remains markedly different from that of the surrounding Romance languages, despite the massive influence of the latter in the realm of vocabulary.

Basra, Arabic AL-BAŠRAH, city, southeastern Iraq. It is the principal port of Iraq. Basra is situated on the western bank of the Shatt Al-Arab (the waterway formed by the union of the Tigris and Euphrates rivers) at the Shatt's

Extent of the Basque language area

exit from Lake Al-Hammār, 70 miles (110 km) by water above Al-Fāw (Fao) on the Persian Gulf. The adjacent terrain is low-lying and deeply intersected by small watercourses.

Basra was founded as a military encampment by the second caliph, 'Umar I, in 638 about 8 miles (13 km) from the modern town of Az-Zubayr, Iraq. Its proximity to the Persian Gulf and easy access to both the Tigris and Euphrates rivers and the eastern frontiers encouraged its growth into a real city, despite the harsh climate and the difficulty of supplying the camp with drinking water. The first architecturally significant mosque in Islām was constructed there in 665.

Basran troops fought the Sāsānian Persians at Nahāvand (642) and conquered the western provinces of Iran (650), while the town itself was the site of the Battle of the Camel (656), an encounter between 'Ā'ishah, the Prophet Muḥammad's widow, and 'Alī, Muḥammad's son-in-law and the fourth caliph.

In the years during and after 'Alī's caliphate (656–661), Basra was a focus of the political strife that arose between the competing religious factions in Islām. This political friction was intensified by a volatile social situation. Whereas the Arab army constituted an aristocracy in Basra, the local and various migrant peoples who had settled there (Indians, Persians, Africans, Malays) were merely *mawālī*, or clients attached to Arab tribes. Basran history from the late 7th century is thus one of unrest and insurrection. The city was seized briefly by the forces of a claimant of the caliphate, 'Abd Allāh ibn az-Zubayr (d. 692), then became the centre of Ibn al-Ash'ath's revolt in 701 and al-Muhallab's revolt in 719–720. Conditions did not improve under the 'Abbāsids, who took over the caliphate in 750. The uprisings continued: the Zoṭṭ, a Gypsylike Indian people, rose up in 820–835; the Zanji, African blacks brought into Mesopotamia for agricultural slave labour, rebelled about 869–883. The Qarmaṭians, an extremist Muslim sect, invaded and devastated Basra in 923, and thereafter the city declined, overshadowed by the prominence of the 'Abbāsīd capital, Baghdad. By the 14th century, neglect and the Mongol invasions left little of the original Basra standing, and by the turn of the 16th century it was relocated at the site of the ancient Al-Ubullah, a few miles upstream.

Basra had been, however, a brilliant cultural centre in its own right throughout the 8th and into the 9th century. It was the home of noted Arab grammarians, poets, prose writers, and literary and religious scholars. Islāmīc mysticism was first introduced in Basra by al-Ḥasan al-Baṣrī, and the theological school of the Mu'tazilāh developed there. Basra is perhaps best known to Westerners as the city from which Sinbad set out in *The Thousand and One Nights*.

Basra was taken by the Turks in 1668. In the 17th and 18th centuries, English, Dutch, and Portuguese traders became established there, and Basra developed considerably during the 19th century as a transshipment point for river traffic to Baghdad. In 1914 the construction of a modern harbour was begun at Basra, which previously had had no wharves. During World War I the British occupied Basra and used it as the port whereby communications were maintained between Mesopotamia and India. Under the ensuing British mandate, many improvements were effected in the city, and both the town and port grew in importance. In 1930 the port installations were transferred from British to Iraqi ownership. During World War II the Allies sent supplies to their Soviet allies through Basra.

The growth of Iraq's petroleum industry in the postwar decades turned Basra into a major petroleum refining and exporting centre. Before the Iran-Iraq War (1980–90), petroleum was pumped from Basra to the town of Al-

Fāw, on the Persian Gulf, and loaded on tankers for export. Basra's refinery was much-damaged in the opening months of the Iran-Iraq War, however, and many of the city's buildings were destroyed by artillery bombardments as the Iranians advanced to within less than 6 miles (10 km) of it in 1987. The city again suffered extensive damage in 1991 during the First Persian Gulf War and in subsequent fighting between rebel factions and government troops. It was captured by British troops during the Second Persian Gulf War (2003).

The modern city of Basra is an agglomeration of three small towns, Basra, Al-'Ashār, and Al-Ma'qil, and several small villages. Around these settlements are extensive palm groves intersected by drainage canals and minor inlets to a width of about 3 miles (5 km) from the Shatt Al-Arab. Basra is situated in an area that is very productive agriculturally despite its large swampy tracts, many of which were drained in the early 1990s. Crops grown include dates, corn (maize), rice, and millet. Pop. city (1991 est.) 1,168,800.

bass, in music, the lowest part in a multi-voiced musical texture. In polyphony of the sort that flourished during the Renaissance, the bass formed one of several relatively independent or contrapuntal melodies.

During the figured-bass era (17th and early 18th centuries), the thorough bass, or basso continuo, furnished a "base" for accompaniments played with relative freedom, though bound by certain conventions as well as shorthand instructions inserted in figures above the bass. In the homophonic, basically chordal, musical styles of the later 18th and 19th centuries, the bass was of crucial structural significance as the lowest of parts and, thus, the foundation of harmony.

In vocal music, the bass is the lowest male voice, with a typical range from the second E below middle C to F# above; the basso profundo is low and rich, while the basso cantante ("singing bass") is lighter and more lyric. Among instruments, the lowest-pitched member of a family is referred to as the bass, for example, the bass recorder or bass viol. The lowest-pitched member of the violin family is called a double bass (*q.v.*).

bass, in zoology, any of a large number of fishes, many of them valued for food or sport. The name bass covers a range of fishes, but most are placed in three families of the order Perciformes: Serranidae, including approximately 400 species of sea bass and grouper (*qq.v.*); Moronidae, sometimes considered a subfamily of the Serranidae and containing about 12 species, such as the striped and European basses; and Centrarchidae (sunfishes), including the black bass (*q.v.*).

Many other fishes are also known as bass; among them are the channel bass, a drum (*q.v.*); the rock bass, a sunfish (*q.v.*); and the calico bass, a crappie (*q.v.*).

Bass, George (b. Jan. 30, 1771, Aswarby, Lincolnshire, Eng.—d. 1803, at sea en route from Australia to South America), surgeon and sailor who was important in the early coastal survey of Australia.

Bass was apprenticed as a surgeon and in 1789 accepted in the Company of Surgeons. He joined the Royal Navy, where his proficiency in navigation and seamanship and interest in Pacific exploration led to his transfer to the ship *Reliance*, on which Matthew Flinders was mate. When the ship reached Port Jackson (in what is now New South Wales) in 1795, Bass, Flinders, and Bass's personal servant William Martin explored the George's River and Botany Bay and recommended a settlement, which was made at Banks Town. In 1796 the three unsuccessfully sought a river south of Botany Bay and discovered and explored Port Hocking. Bass also studied the an-

imals and plants of the region. In 1797 Bass explored the coast south of Sydney and confirmed reports of coal there. Later in the year and in 1798 he determined the existence of a strait—which was named for him—between New South Wales and Van Diemen's Land (Tasmania). In 1799 Bass was elected to the Linnean Society of London for his field collections and writings.

Bass then turned to commercial ventures, although he continued to chart wherever he sailed. In 1803 he sailed with a cargo from Sydney bound for South America and was never heard of again.

bass drum, largest and deepest-sounding military and orchestral drum. The military bass has two heads, tensioned by rope lacings or metal rods, and is struck on both of them. Most orchestral bass drums have only one head, rod-tensioned; two-headed ones normally are struck on one head only. Bass drums are usually played with a pair of large felt-headed sticks, although in modern popular-music bands the drum is commonly struck by one stick operated by a pedal. Bass drums may reach 40 inches (100 cm) in diameter and 20 inches (50 cm) in height. A larger form of one-headed bass drum is the gong drum, often used in British orchestras.

Military bass drum (rope-tensioned)
Messrs. H. Potter, Aldershot, Hampshire, Eng

The bass drum was introduced into Europe in the 18th century in imitation of the music of the Turkish Janissary bands, and it typically appeared in combination with cymbals and triangle. It was at first known as the Turkish drum; the long drum was a deep-shelled instrument that resembled the *davul* of modern Turkey and the Balkans. Originally the bass drum was beaten with a stick in the right hand and a switch in the left; similarly, in modern regimental bands the right hand beats time with a larger stick than that used for the accompanying rhythms played by the left. The bass drum entered the orchestra in the 18th century, at first for special effect, as in Joseph Haydn's *Military Symphony* (1794).

Bass Strait, channel separating Victoria, Australia, from the island of Tasmania to the south. Its maximum width is 150 miles (240 km), and its depth is 180–240 feet (50–70 m). King Island and the Indian Ocean lie at its western extremity, and the Furneaux Group is at its eastern end. Banks Strait is the southeastern opening to the Tasman Sea. Another small group, the Hunter Islands, is located off the northwestern tip of Tasmania. The strait was named in 1798 for the surgeon-explorer George Bass.

Development of the offshore petroleum resources of the strait began with the discovery in 1965 of natural gas at Barraconta and in 1967 of oil at the Halibut and Kingfish fields; production began in 1970.

Bassac (Laos): see Chamapasak.

Bassani, Giorgio (b. March 4, 1916, Bologna, Italy—d. April 13, 2000, Rome), Italian author and editor noted for his novels and stories examining individual lives played out against the background of modern history. The author's Jewish heritage and the life of the Jewish community in Ferrara, where he lived most of his life, are among his recurrent themes.

Bassani, 1987
© Lutfi Ozkok

The collection *Cinque storie ferraresi* (1956; U.K. title, *A Prospect of Ferrara*, U.S. title, *Five Stories of Ferrara*; reissued as *Dentro le mura*, 1973; "Behind the Wall"), in which five novellas describe the growth of fascism and anti-Semitism, brought Bassani his first commercial success and the Strega Prize (offered annually for the best Italian literary work). The Ferrara setting recurs in Bassani's notable novel *Il giardino dei Finzi-Contini* (1962; *The Garden of the Finzi-Continis*; film, 1971). The narrator of this work contrasts his own middle-class Jewish family with the aristocratic, decadent Finzi-Continis, also Jewish, whose sheltered lives end in annihilation by the Nazis.

Later novels include *L'airone* (1968; *The Heron*), a portrait of a lonely Ferrarese landowner during a hunt. This novel received the Campiello Prize for best Italian prose. He also wrote *L'odore del fieno* (1972; *The Smell of the Hay*); and he also published collections of poetry. Bassani's elegiac tone has frequently elicited comparison with that of Henry James and Marcel Proust, his acknowledged models.

Bassano, Hugues-Bernard Maret, duke (duc) de: see Maret, Hugues-Bernard.

Bassano, Jacopo, also called JACOPO, OF GIACOMO, DA PONTE (b. c. 1517, Bassano, republic of Venice [Italy]—d. Feb. 13, 1592, Bassano), late Renaissance painter of the Venetian school, known for his religious paintings, lush landscapes, and scenes of everyday life. The son of a provincial artist, Francesco da Ponte, who adopted the name

Bassano, he was the outstanding member of a thriving family workshop.

His early works, such as the "Susannah and the Elders" (1534–36) and the "Flight into

"Pastoral," oil on canvas by Jacopo Bassano, c. 1560; in the Sammlung Thyssen-Bornemisza, Lugano, Switz.

By courtesy of the Sammlung Thyssen-Bornemisza, Lugano, Switz

Egypt" (c. 1536), reveal the influence of his master, Bonifacio Veronese (Bonifacio di Pitati), a minor Venetian painter, as well as the outmoded anecdotal art of Lorenzo Lotto and the atmospheric light of Titian. As Bassano's art matured, his brushstrokes became looser and the forms and masses of his compositions became larger and more lively—a development that resulted in such frescolike canvases as his "Calvary" (c. 1538–40). About 1540, he was greatly influenced by the elegance of the Florentine and Roman Mannerists. He especially admired the graceful attenuation of Parmigianino's figures, as can be seen in his "Adoration of the Shepherds." But the robust modeling, vibrant colour, and thick impasto of his "Rest on the Flight into Egypt" (c. 1545) lend such works a vigour his Mannerist models lack.

After 1560 Jacopo painted a large number of works, such as the "Madonna with SS. Roch and Sebastian" and "The Adoration of the Magi," characterized by an unearthly pale light, colours, and nervous, attenuated figures in affectedly sophisticated poses.

Landscape and genre subjects became particularly important about 1565–70, when his first paintings of rural life were produced. One of the finest is his "Pastoral." These works elaborated the genre and landscape elements that had been incidental in his religious works.

Jacopo's four sons were all painters, and Francesco the Younger (1549–92) and Leandro (1557–1622) were important in the continuity of the workshop; many Bassano paintings are the product of a family collaboration. Francesco the Younger had a predilection for the rural scenes that were begun by his father, and he developed this aspect of the workshop. He was entrusted with the Venetian branch of the workshop until his death by suicide in 1592. Leandro, who settled in Venice in 1582, was also successful there, receiving a number of commissions for canvases for the Doges' Palace. He is best known now for his portraits in a style based on that of Tintoretto.

Bassano del Grappa, town, Vicenza provincia, Veneto regione, northern Italy, on the Brenta River at the foot of Monte Grappa, north of Padua. Between 1036 and 1259 the town became important under the Ezzelini family, who built the castle the walls of which enclose the often-renovated cathedral. Later disputed by Vicenza, Padua, and Verona, it flourished as a dependency of

Venice from 1405 to 1796. It was famous in the 16th century as the home of the Da Ponte family of painters, surnamed Bassano, and from 1650 to 1850 for its printing and publishing works. Napoleon defeated the Austrians there in 1796, and the town was severely damaged during the heavy fighting on Monte Grappa in 1917–18 and again in World War II.

San Francesco, a 13th-century Romanesque-Gothic church, is notable, and in the cloister of the old convent is the civic museum, which contains ceramics, wood blocks (*legni*), samples from the Remondini printing house, and works of art by Jacopo Bassano and others of his family, Antonio Canova, and Vittore Carpaccio. Since the late 18th century, the famous grappa (a kind of brandy) has been made in the town, which is also a commercial centre with metal and textile industries. Pop. (1999 est.) 39,973.

Bassar, formerly BASSARI, town, north-central Togo. The town lies in a major cotton growing area about 30 miles (50 km) northwest of Sokodé, Togo's second largest town. Bassar serves as an important centre for commercial trade. It has road links with Burkina Faso (formerly Upper Volta) to the north and the national capital of Lomé to the south. The Bassar people inhabit the town and surrounding area. Pop. (1981) 17,764.

basse danse (French: "low dance"), courtly dance for couples, originating in 14th-century Italy and fashionable in many varieties for two centuries. Its name is attributed both to its possible origin as a peasant, or "low," dance and to its style of small gliding steps in which the feet remain close to the ground. Danced by hand-holding couples in a column, it was performed with various combinations of small bows and a series of walking steps completed by drawing the back foot up to the leading foot. The music was in the modern equivalent of $\frac{3}{4}$ time. The basse danse was typically followed by its afterdance, the saltarello.

Basse-Normandie, région, encompassing the northwestern French départements of Orne, Calvados, and Manche and coextensive with western Normandy (*q.v.*). The capital is Caen. The region has an area of 6,791 square miles (17,589 square km) and is bounded by the départements of Ille-et-Vilaine, Mayenne, and Sarthe to the south and Eure-et-Loir and Eure to the east. Manche and Calvados face the English Channel. The uplands of the Massif Armorica extend into Manche and western Calvados and Orne; eastern Calvados and Orne belong to the Paris Basin. A humid climate prevails, with annual precipitation in the Cotentin peninsula of Manche approaching 35 inches (900 mm).

Basse-Normandie is sparsely inhabited. The process of rural depopulation, which characterized much of France in the 19th and early 20th centuries, was especially pronounced in Basse-Normandie, whose population declined by more than 38 percent between 1851 and 1946. It has subsequently grown, and most of the recovery has occurred in Calvados, which has benefited from the growth of Caen. There is a large rural population.

Animal husbandry dominates agriculture. Grainfields around Caen have been converted to pastures for beef cattle, and the regions of Auge in Calvados and Perche in Orne are major producers of beef. Artificial insemination is widely used to improve dairy herds. Camembert cheese is produced in Orne; Pont-l'Évêque and Livarot in Calvados also produce fine cheeses. Large numbers of horses are raised in Manche. Port-en-Bassin in Calvados and Cherbourg are major fishing ports.

Industries are concentrated around Caen, whose manufactures include electronic goods and Citroën automobiles. The production of iron, which is concentrated around Caen in

May-sur-Orne, Soumont, and Potigny, is in decline. Orne has benefited from the decentralization of Parisian industries since 1950. Tourism is being developed along the coast of Calvados between Honfleur and Cabourg. Pop. (1999) 1,422,193.

Basse Santa Su, town and port, eastern Gambia, on the south bank of the Gambia River. It is a branch banking centre, a market centre in peanuts (groundnuts), rice, and cattle among the Muslim Fulani (Fula), Malinke (Mandingo), and Wolof peoples, and the last port of call for the government steamer from Banjul, 244 miles (393 km) downstream. The Basse Health Centre is the largest in the interior. Pop. (1983 prelim.) 5,612.

basse-taille (French: "low-cut"), an enameling technique in which a metal surface, usually gold or silver, is engraved or carved in low relief and then covered with translucent vitreous enamel. This technique dramatizes the

Gold cup of the kings of France and England decorated in basse-taille enamel, showing the life and martyrdom of St. Agnes, 1381; in the British Museum

By courtesy of the trustees of the British Museum

play of light and shade over the low-cut design and also gives the object a brilliance of tone. Developed in Italy in the 13th century, basse-taille enamelwork was especially popular in Europe during the Gothic and Renaissance periods.

Basse-Terre, one of the two major islands of Guadeloupe (*q.v.*).

Basse-Terre, administrative capital of Guadeloupe (an overseas *département* of France), on the Caribbean island of Basse-Terre. The town, dating from 1643, is situated on the western coast of the island between the sea and the 4,868-foot (1,484-metre) peak of Soufrière and is some 4 miles (6 km) from the island's southwestern tip. There is a deepwater anchorage but no harbour. Basse-Terre yielded commercial paramountcy to the town of Pointe-à-Pitre on the adjoining Grande-Terre island in the 18th century. The local port was destroyed by hurricanes in 1979, a serious blow to the efforts to modernize the economy. Pop. (1999) town, 12,410; urban agglom. 54,076.

Bassein, town, southern Myanmar (Burma), on the Bassein River, the westernmost tributary of the Irrawaddy River and navigable by ships up to 10,000 tons. The town is a deepwater port and has several rice mills; rice is exported from there. It also has sawmills and machine shops and is known for its pot-

tery and coloured umbrellas and sunshades. Linked by air and river launch to Yangon (Rangoon), 100 miles (160 km) east, it is also on the railway that runs northeast to Henzada (where the Irrawaddy is crossed by ferry) and continues to Letpadan and Yangon. Construction projects during the late 20th century included a road to Yangon and a road along the west bank of the Irrawaddy to Monya. Bassein College is affiliated with the Arts and Science University at Yangon. There is also a training institute for elementary teachers and a large hospital. The Shwemoktaw pagoda (984) in the centre of town is considered one of the most venerable in southern Myanmar. It was one of several built by the Mon king Samuddaghosa.

The nearby coastline along the Bay of Bengal is backed by the forested Arakan Mountains. Its eastern half is a vast rice-producing alluvial plain in the Irrawaddy delta. The area is noted for its fishing grounds, the largest being Inye Lake, 1.5 miles (2.5 km) long and 1 mile (1.6 km) wide. Diamond Island, an offshore reef, is a popular bathing spot and the haunt of large turtles, whose eggs are collected for sale. Pop. (1993 est.) 183,900.

Bassein, also called **VASAI**, town, western Mahārāshtra state, western India, on the Arabian Sea coast, north of Bombay. Part of the territory of the Hindu Devagiri Yādavas until 1317, it later became a seaport for the Gujarāt Muslim kings. In 1526 the Portuguese established a fort (now in ruins) and trading station at Bassein, and the town became famous for its shipbuilding industry. After frequent but unsuccessful attacks by the Mughals in the 17th century, it fell to the Marāthās in 1739 and was later taken by the British. The town is a large-scale fishing centre and a wholesale exporter for agricultural produce. Its industries are silk and cotton handloom weaving and salt manufacture. Pop. (1991) town, 39,800; metropolitan area, 83,700.

Bassein, Treaty of (Dec. 31, 1802), pact between Bājī Rāo II, the Marāthā peshwa of Pune (Poona) in India, and the British. It was a decisive step in the breakup of the Marāthā confederacy. The pact led directly to the East India Company's annexation of the peshwa's territories in western India in 1818. The Marāthā confederacy was distracted by dissensions following the death in 1800 of the peshwa's minister Nāna Fadnavis. The military chiefs Daulat Rāo Sindhia and Jaswant Rāo Holkar (Hulkar), both with disciplined forces at their back, contended for the control of the peshwa. In October 1802 Holkar defeated Sindhia and the peshwa and installed an adopted brother on the throne of Pune. Bājī Rāo fled to Bassein and appealed for British help.

By the Treaty of Bassein, the peshwa agreed to maintain a British subsidiary force of six battalions, for whose upkeep territory was ceded; to exclude all Europeans from his service; to give up his claims on Surat and Baroda; and to conduct his foreign relations in consultation with the British. In return, Arthur Wellesley (later 1st Duke of Wellington) restored the peshwa to Pune in May 1803. The leading Marāthā state had thus become a client of the British. This treaty led to the Second Marāthā War (1803–05), between the British and the Marāthās, and to the defeat of the three other principal Marāthā powers.

Bassermann, Albert (b. Sept. 7, 1867, Mannheim, Baden [Germany]—d. May 15, 1952, Zürich, Switz.), stage and screen actor known as one of the finest German interpreters of Henrik Ibsen.

Bassermann began his career in Mannheim in 1887 and during engagements in several cities established himself in character roles from William Shakespeare, Friedrich von Schiller, and J.W. von Goethe. From 1890 to 1895 he

was with the Meiningen court theatre and in 1899 joined Otto Brahm in Berlin, where he established his reputation in Ibsen. He was a member of Max Reinhardt's company from

Albert Bassermann, 1948

By courtesy of the National Film Archive, London

1909 to 1915. After World War I, Bassermann worked in some of Leopold Jessner's Expressionist productions of the classics and in 1933 left Germany to protest the Nazi regime. In 1938 he went to the United States, where he played in a variety of Hollywood films. Returning to Europe in 1946, he toured with his own company, whose repertory included Ibsen's *Ghosts* and Schiller's *Wilhelm Tell*. Bassermann was noted for his infinite care with the details of his characterizations, to which he gave an individual stamp, often in defiance of tradition.

Bassermann, Ernst (b. July 26, 1854, Wolfach, Baden [Germany]—d. July 24, 1917, Baden-Baden), German politician, leader of the National Liberal Party through the last years of imperial Germany.

After achieving financial independence as a legal counsel and through other business interests, Bassermann joined the German National Liberal Party and in 1893 was elected to the Reichstag (imperial parliament), where, except for a brief period in 1903, he retained a seat for the rest of his life. A follower of the old National Liberal heroes—especially Eduard Lasker and Rudolf von Bennigsen—he was elected leader of the parliamentary party in 1898 and president of the party executive council in 1905. From 1906 to 1909, in the parliamentary coalition of Chancellor Bernhard von Bülow, he served as mediator between extreme factions but refused all overtures to form a political front with the socialist leader August Bebel and the Social Democrats. His leadership of his own party—torn as it was by conflict from left and right and ever-diminishing membership—was occasionally challenged, but never successfully, and he maintained his control of party affairs until his death.

Basses-Pyrénées (France): *see* Pyrénées-Atlantiques.

basset horn, clarinet pitched a fourth lower than the ordinary Bb clarinet, probably invented in about 1770 by A. and M. Mayrhofer of Passau, Bavaria. The name derives from its basset ("small bass") pitch and its original curved-horn shape (later supplanted by an angular form). Its bore is narrower than that of the Eb alto clarinet, and it has a downward extension of compass to the low F of the bass voice (written as C). The boxwood instrument is usually built to order, in straight form with upturned bell.

Though primarily a German instrument, it was known in Paris by 1774 as a *contre-clarinette* and in London by 1789 as a *clara voce*.

It was employed notably by W.A. Mozart but had practically vanished by 1850. It was

Bohemian basset horn, boxwood and brass, second half of the 18th century; in the Metropolitan Museum of Art, New York City

revived by Richard Strauss (*Elektra*, 1st performed 1909).

basset hound, breed of dog developed centuries ago in France and long maintained, chiefly in France and Belgium, as a hunting dog of the aristocracy. Originally used to trail hares, rabbits, and deer, it has also been used in hunting birds, foxes, and other game. It is characterized as a slow, deliberate hunter, with a deep voice and a "nose" second in keenness only to that of the bloodhound. Short-legged and heavy-boned, the basset hound has long, pendulous ears and a short coat in any combination of black, tan, and white. It stands 30 to 38 cm (12 to 15 inches) and weighs 11 to 20 kg (24 to 44 pounds). The breed has sev-

Basset hound
Sally Anne Thompson—EB Inc

eral varieties, one of the most popular being the sad-eyed Le Couteulx.

Basseterre, chief town of St. Kitts (St. Christopher) island and capital of St. Kitts and Nevis (*q.v.*), a parliamentary federated state located in the eastern Caribbean. It lies on the island's southwestern coast, 60 miles (100 km) west of St. John's, Antigua. Founded in 1627 and rebuilt after being destroyed by fire (1867), it is St. Kitts's chief port and serves as a depot distributing merchandise to neighbouring islands. Sugar refining is the chief industry, and there is trade in sugar, molasses, cotton, salt, and fruit. Places of interest include St.

George's Church, Government House, and a botanical garden. Golden Rock Airport provides air links with the Caribbean and other areas. Old Brimstone Hill Fort is nearby. Pop. (1994 est.) 12,605.

Bassetlaw, district, county of Nottinghamshire, England, with an area of 246 square miles (637 square km). The district occupies the northern quarter of the county. The name Bassetlaw previously applied to the parliamentary constituency that covers much the same area and earlier still was the name of one of the English "wapentakes," or territorial divisions, through which law was administered and defense organized. The court of this wapentake met on a hill called Bassetlaw. Pop. (2001) 107,701.

Bassett, John Spencer (b. Sept. 10, 1867, Tarboro, N.C., American—d. Jan. 27, 1928, Washington, D.C.), American historian and founder of the *South Atlantic Quarterly*, influential in the development of historiography in the American South.

A graduate of Trinity College (now Duke University), Durham, N.C., in 1888, he received a doctorate in 1894 from Johns Hopkins University, Baltimore, and taught history at Trinity College (1893–1906) and at Smith College, Northampton, Mass. (1906 until his death). During his tenure at Trinity he was actively engaged in collecting historical works on the South and by 1902 had launched the *South Atlantic Quarterly*, a literary periodical for scholars. Under his editorship, the *Quarterly* became one of the more liberal periodicals in the South; his own articles deplored racial injustice and provincial isolation.

John Spencer Bassett

By courtesy of Smith College Archives, Northampton, Mass

In 1906 he organized the *Smith College Studies in History*, and in 1919 he was elected secretary of the American Historical Association. A prolific writer, he produced, among other works, *The Federalist System* (1906), *The Life of Andrew Jackson*, 2 vol. (1911), *Short History of the United States* (1913), *The Middle Group of American Historians* (1917), and *Makers of a New Nation* (1928).

Bassi, Agostino (b. Sept. 25, 1773, near Lodi, Lombardy, Habsburg crown land [now in Italy]—d. Feb. 8, 1856, Lodi), pioneer Italian bacteriologist, who anticipated the work of Louis Pasteur by 10 years in discovering that numerous diseases are caused by microorganisms.

In 1807 he began an investigation of the silk-worm disease *mal de segno* (commonly known as muscardine), which was causing serious economic losses in Italy and France. After 25 years of research and experimentation, he was able to demonstrate that the disease was contagious and was caused by a microscopic, parasitic fungus. He concluded that the organism, later named *Botrytis paradoxa* (now *Beauveria bassiana*), was transmitted among the worms by contact and by infected food.

Bassi announced his discoveries in *Del mal del segno, calcinaccio o moscardino* (1835; "The Disease of the Sign, Calcinaccio or Muscardine") and proceeded to make the important generalization that many diseases of

plants, animals, and man are caused by animal or vegetable parasites. Thus, he preceded both Pasteur and Robert Koch in formulating a germ theory of disease. He prescribed methods for the prevention and elimination of muscardine, the success of which earned him considerable honours.

Bassi, Ugo (b. Aug. 12, 1801, Cento, Cisalpine Republic [Italy]—d. Aug. 8, 1849, Bologna). Italian priest and patriot, who was a follower of Giuseppe Garibaldi in his fight for Italian independence.

Educated at Bologna, he became a novice in the Barnabite order at age 18, and, after studying in Rome, he entered the ministry in 1833. He gained fame as a preacher with eloquent and genuinely enthusiastic sermons that attracted large crowds. Living chiefly at Bologna, he traveled all over Italy aiding and tending the poor.

At the outbreak of the revolutionary movements in 1848, when Pope Pius IX still appeared to be a liberal and a nationalist, Bassi joined, as an army chaplain, General Giovanni Durando's papal force protecting the frontiers. His eloquence helped draw new recruits into the republican movement, and he exercised great influence over the soldiers and the people generally. When Pius discarded all connection with the nationalist movement, only Bassi was able to restrain the Bolognese in their indignation. He was wounded at Treviso in May 1848 but, on his recovery, marched unarmed at the head of the volunteers at Mestre.

After the pope's flight from Rome in November and the proclamation of the Roman republic in early 1849, Bassi joined the forces of Garibaldi, fighting against French troops that were sent in to restore the temporal power. When Garibaldi was forced to leave Rome, Bassi followed him to San Marino; when the legion broke up, Garibaldi escaped but Bassi and a fellow patriot, Count Livraghi, were captured near Comacchio. Turned over to the Austrian authorities and taken to Bologna, they were charged with having been found with guns in their hands (Bassi had never borne arms) and were executed.

Bassompierre, François de (b. April 12, 1579, Castle of Harrouel, Lorraine [now in France]—d. Oct. 12, 1646, Castle of Tillières, Normandy, Fr.), French soldier and diplomat who left an influential autobiography, *Le Journal de ma vie* (1665; *The Journal of My Life*).

Bassompierre was descended from an old family that had for generations served the dukes of Burgundy and Lorraine, and, after being educated with his brothers in Bavaria and Italy, he was introduced to the French court of King Henry IV in 1598. He became a great favourite of the king and shared to the full in the dissipations of court life. In 1600 he took part in the brief campaign in Savoy, and in 1603 he fought in Hungary for the emperor against the Turks.

In 1614 he assisted Marie de Médicis in her struggle against the nobles, but, upon her failure in 1617, he remained loyal to King Louis XIII. His services during the Huguenot rising of 1621–22 won for him the dignity of marshal of France. He was with the army of the king during the siege of La Rochelle in 1628 and in 1629 distinguished himself in the campaign against the rebels of Languedoc; after a short campaign in Italy his military career

ended. As a diplomat in Spain, Switzerland, and England, his career was undistinguished. Sometime between 1614 and 1630 he was secretly married to Louise-Marguerite of Lorraine, widow of François, prince de Conti, and through her became implicated in the plot to overthrow the Cardinal de Richelieu on the "Day of the Dupes," 1630. His share was only a slight one, but his wife was an intimate friend of Queen Marie de Médicis, and her hostility to the cardinal aroused Richelieu's suspicions. By Richelieu's orders, Bassompierre was arrested at Senlis on Feb. 25, 1631, and put into the Bastille, where he remained until Richelieu's death in 1643. On his release his offices were restored to him, and he passed most of his time at the castle of Tillières in Normandy until his death.

Bassompierre's *Mémoires*, which constitute an important source for the history of his time, were first published at Cologne in 1665. He also left an incomplete account of his embassies to Spain, Switzerland, and England (Cologne, 1668).

bassoon, French *BASSON*, German *FAGOTT*, principal tenor and bass instrument of the orchestral woodwind family. Its narrow conical bore leads from the curved metal crook, onto which the double reed is placed, downward through the wing joint (on which are the left-hand finger holes) to the butt joint (on which are the right-hand holes). The bore then doubles back, ascending through the butt to the long joint and bell, where the holes are controlled by keywork for the left thumb. The bassoon is held on a sling aslant across the body. Its classical compass is three octaves upward from the B \flat below the bass staff, the most-used melodic range coinciding with that of the tenor voice. Since the mid-19th century, the range has been extended up to treble E.

The bassoon is exceptionally difficult to play because the traditional placing of the finger holes is scientifically irrational; yet this is essential to the production of a tone quality that has been one of the primary orchestral colours from George Frideric Handel's time. The reed is made by bending double a shaped strip of cane.

Bassoon

By courtesy of United Musical Instruments U.S.A., Inc., Elkhart, Indiana

The bassoon is a 17th-century development of the earlier fagotto, or dulzian, known in England as the curtal. It was first mentioned in about 1540 in Italy, with the descending and ascending bores contained in a single piece of maple or pear wood. Many examples survive in museums at Brussels, Berlin, Vienna, and elsewhere. The present construction in four separate joints is thought to have been developed in France by 1636, closely following the reconstruction of the shawm,

which produced the oboe, to which the bassoon served as bass. During the 18th century the individuality of the bassoon became recognized not only in the orchestra (in which two have normally been since employed) but also as a solo instrument for concerti. Well into Wolfgang Amadeus Mozart's time in the late 18th century, no mechanism was required beyond four keys, most of the semitones outside the natural scale of C having been well obtained by cross-fingerings opening the holes nonconsecutively. Leisurely addition of keys from about 1780 led to Jean-Nicolas Savary's Paris models of about 1840, which, with further improvements in bore and mechanism, became the 20-keyed French bassoon, made by the firm of Buffet-Crampon, that is used in France, Italy, and Spain and by some British players.

Although it has preserved and developed the sympathetic vocal sonority of the classical instrument, the French bassoon remains difficult to control, owing to inherent unevenness in the quality and steadiness of many notes. Alterations to minimize these defects were initiated in Germany in 1825 by Carl Almenröder. A reformed model was developed by the firm of Johann Adam Heckel and perfected in the German bassoon that is now standard everywhere except in France, Italy, and Spain. It is of European maple, with its own positions and sizes of the holes to give a more even and positive response throughout the compass. It can be more quickly learned, is easier to choose reeds for, and is in many respects more telling in a large orchestra. Research on old bassoons suggests that its tone quality, different from the French and considered by some to have sacrificed eloquence for expediency, may not represent as gross a deviation from classical tone as was hitherto believed.

The first useful contrabassoon, or double bassoon, sounding an octave lower than the bassoon and much employed in large scores, was developed in Vienna and used occasionally by the classical composers. The modern contrabassoon follows Heckel's design of about 1870, with the tubing doubled back four times and often with a metal bell, pointing downward.

Bassville, Nicolas-Jean Hugou de (b. Feb. 7, 1753, Abbeville, France—d. Jan. 14, 1793, Rome, Papal States [Italy]), French journalist and diplomat whose death in Rome at the hands of a mob was exploited by the French Revolutionary governments as a grievance against the papacy.

Bassville was at first employed as a tutor and wrote two educational works. At the outbreak of the Revolution in 1789, he became an editor of the *Mercure national*. In 1790 he published his *Mémoires historiques, critiques et politiques sur la Révolution de France* ("Historical, Critical, and Political Memoirs of the Revolution of France"). Entering the diplomatic service, he went in May 1792 as secretary of legation to Naples and was soon sent, without official status, to Rome. His conduct in Rome, in particular his provocative display of the French tricolour, enraged the populace. On Jan. 13, 1793, Bassville, who had been driving with his family to the Corso, was pursued by a hostile crowd and dealt a wound from which he died the next day.

The responsibility for the murder was laid by the National Convention on the pope, and in 1797, by an article of the Peace of Tolentino, the French Directory exacted damages of 300,000 livres for Bassville's family.

basswood, any of certain species of linden (*q.v.*) common to North America, especially *Tilia americana*, which is found in a vast area of eastern North America but centred in the Great Lakes region; and *T. caroliniana* and *T. georgiana*, which are found in the southeastern United States.

Bast (Egyptian goddess): *see* Bastet.

bast (botany): *see* phloem.

bast fibre, soft, woody fibre obtained from stems of dicotyledonous plants (flowering plants with net-veined leaves) and used for textiles and cordage. Such fibres, usually characterized by fineness and flexibility, are also known as "soft" fibres, distinguishing them from the coarser, less flexible fibres of the leaf, or "hard," fibre group. Commercially useful bast fibres include flax, hemp, jute, kenaf, ramie, roselle, sunn, and urena.

Fibre bundles are often several feet long and composed of overlapping cellulose fibres and a cohesive gum, or pectin, which strengthens plant stems. The fibres are located between the epidermis, or bark surface, and an inner woody core. In harvesting bast fibres, the plant stalks are cut off close to the base or pulled up. The fibres are usually freed from the stalk by retting but are sometimes obtained by decortication, a manual or mechanical peeling operation. The released fibre bundles, called strands, are frequently used without additional separation, in which case they are called fibres. Flax and ramie strands, however, are usually separated into individual fibre cells, or true plant fibres.

Most bast fibres are quite strong and are widely used in the manufacture of ropes and twines, bagging materials, and heavy-duty industrial fabrics. In the late 20th century, jute, used mainly for sacking and wrapping purposes, led other fibres in world production but suffered from intense competition from synthetic fibres. Flax, traditionally valued as raw material for linen yarn and fine linen fabrics, is decreasing in importance for luxury textile applications as other fibres, both natural and man-made, become more plentiful.

Bastām, also spelled *BUSTAM*, *BISTAM*, *BES-TAM*, or *BOSTUM*, small historic town, northern Iran. It lies just south of the Elburz Mountains in a well-watered plain. Clustered around the tomb of the poet and mystic Abū Yazīd al-Bisṭāmī (d. 874) are a mausoleum, a 12th-century minaret and mosque wall, a superb portal (1313), and a 15th-century college. Nearby are interesting ruins, including a mosque and a cloister with fine stucco. Most of the town's old constructions were ordered built by two Mongol rulers, Hahmūd Ghāzān (1295–1304) and Öljeitü (1304–16). Pop. (1986) 6,401.

bastard toadflax, any of several small annual or perennial herbs of the sandalwood family (Santalaceae) that have narrow leaves resembling those of true toadflax (*Linaria*). In North America, bastard toadflax refers to plants of the genus *Comandra*. They are sometimes parasitic on the roots of other plants and have creeping roots, small white flowers clustered at the top of each plant, and one-seeded fruits.

In Europe the name bastard toadflax is used for plants of the genus *Thesium*, which also has species distributed throughout Africa, Asia, and South America. The bisexual yellow or yellowish green flowers are grouped in terminal clusters, and the one-seeded fruit is dry and green.

Bastarnae, in Hellenistic and Roman times, large tribe settled in Europe east of the Carpathian Mountains from the upper valley of the Dniester River to the Danube River delta. The Bastarnae were used by the Macedonian kings Philip V and Perseus against their Thracian enemies and by Mithradates of Pontus against the Romans. The name Peucini, occasionally applied to the tribe, properly belonged only to part of it. Pliny and Tacitus, as well as recent archaeological dis-

coveries, confirm the Germanic origins of the tribe. Subdued by the Roman general Marcus Licinius Crassus in 29 BC, the Bastarnae caused the Romans little trouble until the 3rd century AD, when they joined with other tribes in raiding Roman territory. The Roman emperor Probus then transplanted them to the southern bank of the Danube (AD 279–280).

Baster, Afrikaans **BASTER** (from *baster*, "bastard," or "half-breed"), member of a racially mixed group in Namibia and northwestern South Africa, most of whom are descendants of 18th-century Dutch and French men and indigenous Nama (Khoikhoi) women of southwestern Africa. They speak a language that is primarily Afrikaans and follow a Western way of life. In the late 20th century they numbered about 32,000.

The Basters were originally seminomadic pastoralists and hunters who gradually settled as pioneers in the northwestern frontier areas north of the Cape Colony. Largely through missionary work during the 19th century, they coalesced into fiercely independent, autonomous communities that maintained their identities even after being incorporated into the Cape Colony. Others moved farther north into what is now Namibia in the late 1860s because of pressure from Boer settlers and eventually established a settlement that became known as Rehoboth.

The Rehoboth community remains the largest group of Basters. They practice subsistence farming and keep cattle and sheep, but they also rely heavily on the remittances of migrants who work in Windhoek as skilled artisans, in Walvis Bay as labourers or fishermen, and in the diamond mines near the Orange River mouth at the South African border.

Bastet, also called **BAST**, or **UBASTI**, ancient Egyptian goddess worshiped in the form of a lioness, and later a cat. Bastet was an ancient deity whose nature changed after the domestication of the cat around 1500 BC. She was

Bastet, cat-headed goddess of Bubastis, statuette, 22nd–25th dynasty; in the British Museum

Reproduced by courtesy of the trustees of the British Museum

native to Bubastis in the Nile River delta but also had an important cult at Memphis. In the Late and Ptolemaic periods large cemeteries of mummified cats were created at both sites, and thousands of bronze statuettes of the goddess were deposited as votive offerings. Small figures of cats were also worn as amulets; this too was probably related to the cult of Bastet.

Bastet is represented as a lioness or as a woman with a cat's head: she carries an ancient percussion instrument, the sistrum, in her right hand; a so-called aegis, or breastplate (in Bastet's case, surmounted with the head of a lioness), in her left hand; and a small bag over her left arm. She wears an elaborately ornamented dress. Her cult was carried to Italy by the Romans, and traces have been found in Rome, Ostia, Nemi, and Pompeii.

Basti, city, southeastern Uttar Pradesh state, northern India. It lies east of Faizābād on the Kuwāna River. Located on a national highway and a major rail line, it is an agricultural trade centre with some industry at nearby villages. Basti consists of three sections—Old Basti, extending east-west between the railway and the provincial road; Pukka Bāzār, a suburb just southwest with official and professional residences; and the "civil station," an administrative sector west of Pukka Bāzār, on the Kuwāna River. The city has a college affiliated with Gorakhpur University. Basti was small until 1865, when it became a district headquarters. Since then its population has greatly increased.

Basti lies in a stretch of alluvial plain, poorly drained and containing a number of swamps and marshy lakes; grains, sugarcane, and other crops are grown, in some places under irrigation. Pop. (1991 prelim.) 87,512.

Bastia, city, capital of Haute-Corse *département*, Corse *région*, France. It lies on the northeastern coast of Corsica, 22 miles (35 km) south of the island's northernmost point,

Bastia, on the northeastern coast of Corsica
Marc Garanger

the tip of Cape Corse. It is close to the Italian mainland (73 miles [117 km] from Livorno), and across the Tyrrhenian Sea can be seen the island of Elba, flanked by Monte Cristo and Capraia. Originally a poor fishing village called Marina di Cardo, in 1383 it changed its name after a Genoese keep, or *bastiglia*, was constructed there. Bastia was the capital of Corsica until 1791 and still is military headquarters of the island. The old town (Terra Vecchia) is built in and around the central part of the harbour. The upper town (Terra Nuova) lies to the south, the modern town to the north and west. The old town is a network of alleys connected by dark, vaulted passages. The classical facades of the Church of San Giovanni Battista, law court, theatre, and city hall are floridly decorated.

Bastia is the largest city in Corsica, a modern port city and, since 1976, capital of the *département* of Haute-Corse. Bastia manufactures cigarettes, cigars, and preserves, and its exports include the celebrated wines of Cape Corse. Pop. (1990) 38,728.

Bastian, Adolf (b. June 26, 1826, Bremen, Ger.—d. Feb. 2, 1905, Port of Spain,

Trinidad), ethnologist who theorized that there is a general psychic unity of humankind that is responsible for certain elementary ideas common to all peoples. Bastian proposed that cultural traits, folklore, myths, and beliefs of various ethnic groups originate within each group according to laws of cultural evolution and are essentially the same, merely differing in form because of geographic environment. His views are thought to have influenced a number of prominent anthropologists, including Bronislaw Malinowski. The concept of the

Bastian

Bavaria-Verlag

collective unconscious advanced by the psychoanalyst Carl Jung is believed to have been derived from Bastian's theory of elementary ideas.

In 1851 Bastian went to sea as a ship's surgeon on the first of many voyages he was to make in the course of his lifetime. His first venture took him to many parts of the world, including South America, the West Indies, Australia, China, India, and Africa. *Der Mensch in der Geschichte*, 3 vol. (1860; "Man in History"), is considered his major work. Five years in the Orient preceded publication of his *Die Völker des östlichen Asien*, 6 vol. (1866–71; "The People of Eastern Asia"). He then became professor of ethnology at Friedrich Wilhelm University, Berlin. He was the founder and curator of the Royal Museum of Ethnology, Berlin, which was for many years one of the most important institutions of its kind, and he enriched it with his own substantial collection.

Bastiat, Frédéric, in full **CLAUDE-FRÉDÉRIC BASTIAT** (b. June 29, 1801, Mugron, near Bayonne, France—d. Dec. 24, 1850, Rome, Papal States [Italy]), French economist, best known for his journalistic writing in favour of free trade and the economics of the Scotsman Adam Smith.

In 1846 he founded the Associations for Free Trade and used its journal, *Le Libre-Échange* ("Free Trade"), to advance his antiprotectionist views. In a well-known satirical parable that appeared in his *Sophismes économiques* (1845; *Sophisms of Protection*), Bastiat con-

Bastiat, detail of an engraving

H. Roger-Viollet

cocted a petition brought by candlemakers who asked for protection against the Sun, suggesting that candlemaking and related industries would greatly profit if the Sun were eliminated as a competitor in furnishing light.

During the revolutionary years 1848–49 he wrote against the rise of socialism, which he identified with protectionism. It was primarily his campaign against socialism and communism that won for him a seat in the Constituent Assembly in 1849 and in the subsequent Legislative Assembly of the same year. Bastiat also carried on a vigorous, if unsystematic, polemic against Ricardian economics.

bastide, type of village or town built largely in the 13th and 14th centuries in England and Gascony and laid out according to a definite geometric plan. It is thought by some to have been an influence on English colonists when building such New World settlements as New Haven, Conn.

Edward I of England, also duke of Gascony, was one of the foremost rulers to lay out new towns. He did so for defensive, economic, and colonizing purposes. The lord of a manor with a successful bastide on it could expect an increase of revenue from the rents, fair and market tolls, justice profits, and trade tariffs. Most of the British bastides, especially those in Wales, had a marine-based economy, while the Gascon bastides were dependent on the production and exportation of wine.

With allowances made for local terrain, bastides were laid out according to a rectangular grid derived from ancient Roman town plans. The bastide was often built on a hilltop, with the streets dividing the town into rectangular *insulae* ("islands" or "blocks"), which, in turn, were divided into *placae*, or house and garden lots. In order to facilitate rent collecting, the blocks were numbered in military fashion from right to left, top to bottom. The streets, as far as possible, met at right angles. A marketplace was always planned, which included arcaded shops (*cornières*) and sometimes a market hall.

The typical bastide is found in the ruins of New Winchelsea, Eng., a town that died because the sea on which it depended receded, leaving marshland. In Gascony the bastides were founded for security and colonization purposes in a heavily forested area. Bastides in Gascony include Lalinde, Beaumont-du-Périgord, and La Bastide Monestier.

Bastien-Lepage, Jules (b. Nov. 18, 1848, Damillers, Fr.—d. Dec. 10, 1884, Paris), French painter of rustic outdoor genre scenes widely imitated in France and England.

Bastien-Lepage studied under Alexandre Cabanel, first exhibited at the Paris Salon of

"The Hayfield," painting by Bastien-Lepage, 1878; in the Louvre, Paris
Eddy van der Veen

1870, and won a medal at the Salon of 1874 for "Spring Song," which stylistically owes a little to Edouard Manet. "The Hayfield"

(1878; Louvre, Paris) follows in the tradition of Jean-François Millet and reveals the sentimental element that characterizes Bastien-Lepage's work. "Joan of Arc Listening to the Voices" (Metropolitan Museum of Art, New York City), which represents Joan as a Lorraine peasant, typifies his subject pictures. He was also a portraitist of note.

Bastille, medieval fortress on the east side of Paris that became, in the 17th and 18th centuries, a French state prison and a place of detention for important persons charged with miscellaneous offenses. The Bastille, stormed by an armed mob of Parisians in the opening days of the French Revolution, was a symbol of the despotism of the Bourbons and held an important place in the ideology of the Revolution.

With its eight towers, 100 feet high, linked by walls of equal height and surrounded by a moat more than 80 feet wide, the Bastille dominated Paris. The first stone was laid on April 22, 1370, on the orders of Charles V of France, who had it built as a *bastide*, or fortification (the name Bastille is a corruption of *bastide*), to protect his wall around Paris against English attack. The Bastille, in fact, was originally a fortified gate, but Charles VI turned it into an independent stronghold by walling up the openings. In 1557 its defensive system was completed on the eastern flank by the erection of a bastion. In the 17th century a transverse block was built, dividing the inner court into unequal parts.

The Cardinal de Richelieu was the first to use the Bastille as a state prison, in the 17th century; the yearly average number of prisoners was 40, interned by *lettre de cachet*, a direct order of the King, from which there was no recourse. Prisoners included political troublemakers and individuals held at the request of their families, often to coerce a young member into obedience or to prevent a disreputable member from marring the family's name. Under Louis XIV, the Bastille became a place of judicial detention in which the *lieutenant de police* could hold prisoners; under the regency of Philippe II, duc d'Orléans, persons being tried by the Parlement were also detained there. Imprisonment by *lettre de cachet* remained, however, in force, and prohibited books were also placed in the Bastille. The high cost of maintaining the building prompted talk of demolition in 1784.

On the morning of July 14, 1789, when only seven prisoners were confined in the building, a mob advanced on the Bastille with the intention of asking the prison governor, Bernard Jordan, marquis de Launay, to release the arms and munitions stored there. Angered by Launay's evasiveness, the people stormed and captured the place; this dramatic action came to symbolize the end of the ancien régime. The Bastille was subsequently demolished by order of the Revolutionary government.

Bastille Day, celebrated annually on July 14, was chosen as a French national holiday in 1880. It is celebrated with parades, speeches, and fireworks and with such slogans as *Vive le 14 juillet!* ("Long live the 14th of July!") and *A bas la Bastille!* ("Down with the Bastille!").

bastnaesite, also spelled **BASTNÄSITE**, a cerium fluoride carbonate, $\text{CeCO}_3(\text{OH},\text{F})$, found in contact metamorphic zones and pegmatites; cerium is commonly substituted by light rare earths, lanthanum, yttrium, and thorium. It ranges in colour from wax-yellow to reddish-brown. Bastnaesite is commonly associated with other rare-earth-bearing minerals such as allanite, cerite, and tysonite; it is often an alteration product of tysonite. Bastnaesite occurs in pegmatites near Pikes Peak, Colo. and with fluorite in Lincoln County, New Mexico; it is commercially mined at Mountain Pass, Calif. For detailed physical properties, see carbonate mineral (table).

Bastrop, city, Morehouse parish, northeastern Louisiana, U.S., 29 mi (47 km) northeast of Monroe. Founded in 1846 as the parish seat, it experienced an industrial boom after 1916, when natural gas was discovered. Manufactures include wood products, carbon black, and chemicals. Bastrop is also an agricultural centre (cattle, cotton, corn, rice, and soybeans) and site of the North Louisiana Cotton Festival and Fair. Nearby are Chemin-A-Haut State Park and Bussey Brake Reservoir. Inc. city, 1952. Pop. (1990) 13,916.

Bastwick, John (b. 1593, Writtle, Essex, Eng.—d. September/October 1654), English religious zealot who opposed Roman Catholic ceremonial in the years before the outbreak of the English Civil War.

After a brief education at Cambridge, he wandered on the Continent and graduated in medicine at Padua, Italy. On his return he settled in Colchester. About 1633 he printed in the Netherlands two Latin treatises, entitled *Elenchus Religionis Papisticae* and *Flagellum Pontificis et Episcoporum Latialium*; and because William Laud and other English prelates thought themselves the target of the treatises, he was fined, excommunicated, and prohibited from practicing medicine; his books were burned, and he was consigned to prison. His counterblast was *Apologeticus ad Praesules Anglicanos* and another book, in English, *The Litany*, in which he charged the bishops with being the enemies of God and "the tail of the beast." Bastwick, William Prynne, and Henry Burton came under the lash of the Star Chamber court at the same time; they were all censured as turbulent and seditious persons and condemned to pay a fine of £5,000 each, to be set in the pillory, to lose their ears, and to undergo imprisonment for life in remote parts of the kingdom, Bastwick being sent to Scilly. The Parliament in 1640 reversed these proceedings and ordered Bastwick a reparation of £5,000 out of the estates of the commissioners and lords who had sentenced him. He joined the Parliamentary army but in later years showed bitter opposition to the Independents.

Basuku (people): see Suku.

bat, a member of any of some 900 species of flying mammals. Bats are the only mammals to have evolved true flight, and most species also possess an acute system of acoustic orientation, or echolocation.

A brief treatment of bats follows. For full treatment, see MACROPAEDIA: Mammals.

Most bats are insectivorous. As they consume immense quantities of insects, bats are important in the balance of insect populations and may even be instrumental in controlling some insect pests. Certain bats also feed on fruit, pollen, and nectar, and vampire bats in tropical America feed on the blood of mammals and large birds. These bats sometimes serve as carriers of rabies.

Bats are found worldwide. The United States is known to have 15 genera, totalling 40 species of bats. While in the West they are the subject of unfavourable myths, in the Orient bats are often considered to be good luck symbols. In the tropics, where they are particularly abundant, bats attract considerable attention by their noisiness, guano (droppings), and odor, as large colonies of bats can infest houses and public buildings.

Two suborders divide the bat order: the Megachiroptera (flying foxes and Old World fruit bats) and the Microchiroptera (distributed worldwide). The Megachiroptera are visually oriented—only one genus, *Rousettus*, possesses an acoustic orientation ability—and in many ways skeletally primitive. The Microchiroptera all possess the ability to orient and even hunt by acoustic means. It is not

known whether the two have a common origin. Bats vary greatly in size. The largest of the flying foxes, *Pteropus vampyrus*, has a wingspread of as much as 1.5 m (5 feet), while the wingspread of Kitt's hognose bat (*Craseonycteris thonglongyai*) is about 15 cm (6 inches). Bats also display variety in colour, fur texture, and facial appearance.

The wings of bats are an evolutionary modification of the forelimbs. The fingers (not including the thumb) are greatly elongated and joined by a membrane extending from the forearm and upper arm down the side of the body to the ankle or foot. The thumb ends with a claw. Most bats also have a two-layer membrane of darkly pigmented, naked skin extending between their legs.

The bat's muzzle is often rodentlike or fox-like. The external ear projects forward and is usually very large and often highly mobile. Many bats also have a nose leaf, which consists of skin and connective tissue that either surrounds the nostrils or flaps above them. It is thought that the nose leaf influences sound production for echolocation. The bat's neck is short, the chest and shoulders well muscled and large, and the hips and legs slender. Except for the wing membranes, bats are well furred in shades of gray, tan, brown, or black on the back and in lighter shades ventrally. Among species that roost in the open, mottled or speckled fur and variations in coloration are common.

Bats affect the natural order by predation and by pollination and seed dispersal, which they aid by their feeding habits. Only the vampire bats of tropical America pose a serious problem to man; among livestock they can transmit rabies in cattle. The guano deposits of insectivorous bats have long been used for agricultural fertilizer.

The sexual cycles of entire bat populations are synchronized so that most of the mating activity occurs over a period of a few weeks. Gestation ranges from six or seven weeks to five or six months. Pregnant female bats of many species migrate to special nursery roosts. Bats generally bear one young, although the big brown bat (*Eptesicus fuscus*) can bear twins and the red bat (*Lasiurus borealis*) bears a litter of one to four. Infants are born nude or with light fur and are often blind and deaf for a short period after birth. They nurse for five or six weeks or for as long as five months, depending on size and subspecies. By two months of age most Microchiroptera are adult-sized.

Nearly all bat species roost during the day and forage at night. This gives carnivorous bats, vampires, and perhaps fishing bats an advantage over sleeping prey and also protects bats from predators, sun, and high temperatures. Bats generally prefer isolated roosts such as caves, crevices, burrows, or buildings. Some bats, however, roost outdoors on trees or rocks. Usually bats are found in clustered colonies ranging from a few dozen to hundreds of thousands of individuals. Predation is not a serious threat to bats, and disease, starvation, and accidents appear to take small tolls. Some bats are known to have lived more than 20 years. Isolated roosts, nocturnal activity, and a generally colonial way of life are factors that contribute to the longevity of bats.

In those bats that use echolocation, short high-frequency sound pulses are produced that reflect from objects in the vicinity. The bats listen to the returning echoes and are able to locate prey and obstacles. Highly sensitive ears and greatly developed integration of vocal and auditory centres of the brain are required for this feat. The sound pulses may also be used for communication between bats.

bat bug, any blood-sucking insect of the family Polyctenidae (order Heteroptera), which

numbers at least 18 species. Bat bugs are external parasites found in the fur of tropical bats. The adult (between 3.5 and 5 mm [0.14 and 0.2 inch] long) lacks eyes and wings. Its forelegs are short and thick, and its middle and hindlegs are long and slender. As indicated by the family name, the bat bug has from one to many comblike rows of spines (ctenidia) on its body. The young are born alive in an advanced stage of development.

bat-eared fox, also called CAPE FOX, BIG-EARED FOX, or MOTLOSI (species *Otocyon megalotis*), large-eared fox, belonging to the dog family (Canidae), found in open, arid areas of eastern and southern Africa. It has 48 teeth, 6 more than any other canid. The bat-eared fox is like the red fox in appearance but has unusually large ears. It is yellowish gray

Bat-eared fox (*Otocyon megalotis*)

Mark Boulton from the National Audubon Society Collection/Photo Researchers—EB Inc

with black face and legs and black-tipped ears and tail. It grows to a length of about 80 cm (32 inches), including a 30-centimetre (12-inch) tail, and weighs from 3 to 4.5 kg (6.6–10 pounds). It lives alone or in small groups and feeds primarily on insects, especially termites. Litters contain two to five young; gestation lasts 60 to 70 days.

bat fly, any insect belonging to the two families Nycteribiidae and Streblidae (order Diptera). Members of the family Nycteribiidae are wingless, spiderlike insects with long legs and a small head that folds back into a groove in the thorax when at rest. They are external parasites of bats. Members of the family Streblidae do not bend their heads back. Wings may be present, vestigial, or absent.

B.A.T Industries PLC, originally (1902–76) BRITISH-AMERICAN TOBACCO COMPANY LTD., as of 1998 BRITISH AMERICAN TOBACCO PLC, leading British manufacturer and marketer of tobacco products.

The company originated in 1902 as a joint venture by the U.S.-based American Tobacco Company and the U.K.-based Imperial Tobacco Company, Ltd. It expanded rapidly during World War I and afterward, marketing cigarettes throughout the world and achieving an especially strong presence in China, where cigarette smoking had become common by the 1920s. In 1927 it acquired the Brown & Williamson Tobacco Corporation (headquartered in Louisville, Ky.), which grew to become one of the largest cigarette manufacturers in the United States, with such brands as Kool and Viceroy.

In 1976 the firm was reorganized as a holding company and renamed B.A.T Industries. It entered the field of financial services but in 1997 merged its financial services businesses with the Zurich Group, a Swiss financial services company.

With its increasing focus on the tobacco business, the B.A.T was renamed British American Tobacco PLC in 1998. Its acquisitions have included the American Tobacco Company

(1994), Rothmans International (1999), and Canada's largest cigarette company, Imperial Tobacco (2000). The company was a defendant in litigation initiated by state attorneys general and, along with other tobacco companies, signed a \$200-billion master settlement agreement.

Bat Yam, city, west-central Israel, on the Plain of Sharon and the Mediterranean coast just south of Tel Aviv-Yafo. Founded in 1926 as a suburban development called Bayit ve-Gan (Hebrew: "House and Garden"), it was abandoned during the Arab riots of 1929. Re-settled, it developed as a seaside resort and residential suburb of Tel Aviv. In 1936 the name was changed to Bat Yam (meaning "daughter of the sea"), and the town received municipal status. After 1950 its population grew rapidly, as housing quarters were built for new Jewish immigrants. Bat Yam is a principal centre of Israel's printing and publishing industry; the beverage industry is also important. Inc. city, 1958. Pop. (1999 est.) 137,000.

Bataan Death March, forced march of 70,000 American and Filipino prisoners of war captured by the Japanese in the Philippines in the early stages of World War II. Starting out from Mariveles, on the southern end of the Bataan Peninsula, on April 9, 1942, they were force-marched 55 miles (88 km) to San Fernando, then taken by rail to Capas, from where they walked the final 8 miles (13 km) to Camp O'Donnell. They were starved and mistreated, often kicked or beaten on their way, and many who fell were bayoneted. Only 54,000 reached the camp; 7,000–10,000 died on the way and the rest escaped to the jungle.

After the war, the Japanese commander of the invasion forces in the Philippines, Lieutenant General Homma Masaharu, was charged with responsibility for the death march and was tried by a U.S. military commission in Manila in January–February 1946. Convicted, he was executed on April 3.

Bataan Peninsula, peninsula in central Luzon, Philippines, sheltering Manila Bay (east) from the South China Sea. It is about 30 miles (50 km) long and 15 miles (25 km) wide and occupies an area of about 530 square miles (1,370 square km). Corregidor Island (*q.v.*) lies just off its southern tip at the entrance of the bay. Bataan is largely covered by jungle and is traversed north to south by steep mountains culminating in Mount Natib (4,224 feet [1,287 m]) in the north and Mount Bataan (4,701 feet [1,433 m]) in the south.

After the Japanese invasion of the Philippines in December 1941 and the fall of Manila (Jan. 2, 1942), the defending Americans and Filipinos withdrew to Bataan, defeating Japanese efforts to split the forces of U.S. General Douglas MacArthur. His troops fought a fierce delaying action until April 9, 1942, and remnants, led by Lieutenant General Jonathan M. Wainwright, escaped to Corregidor Island, where they surrendered about a month later. (*See also* Bataan Death March.) On Jan. 9, 1945, U.S. forces under MacArthur sealed off the Bataan Peninsula. Landings were then made at Mariveles Harbor in the south and on Corregidor Island, thus securing Manila Bay for the U.S. Navy.

The major city on the peninsula is Balanga. Subic Bay in the north is the site of U.S. and Philippine naval bases. There are shipyards at Mariveles. Because of the proximity of Manila, none of Bataan's five ports is open to overseas shipping. The towns of Orani, Samal, Abucay, Orion, and Limay lie along the eastern coastal plain, the principal agricultural (rice, corn [maize], sugarcane) district. Morong and Bagac are on the western coast. Hermosa in the north is the site of Roosevelt National Park (1933), a 3,296-acre (1,334-hectare) area with hot springs and a game refuge. The Bataan National Park (1945), on Manila Bay,

is largely a World War II commemorative area of 77,593 acres (31,402 hectares). Pop. (1990 est.) 467,078.

Batabanó, Gulf of, Spanish GOLFO DE BATABANÓ, inlet of the Caribbean Sea, indenting southwestern Cuba. The gulf stretches from the shore of eastern Pinar del Río province approximately 80 miles (130 km) to the southwestern coast of Matanzas province and the Zapata Peninsula. At its northern edge lies La Habana province; 50 miles (80 km) to the south is the Isle of Juventud. The shallow gulf, economically important for sponge fishing, is dotted with many smaller islands and keys.

Bataille, Georges (b. Sept. 10, 1897, Billom, Fr.—d. July 9, 1962, Paris), French librarian and writer whose essays, novels, and poetry expressed his fascination with eroticism, mysticism, and the irrational. He viewed excess as a way to gain personal "sovereignty."

After training as an archivist at the school of paleography known as the École des Chartes (School of Charters) in Paris, he worked as a librarian and medieval specialist at the Bibliothèque Nationale in Paris until 1942. In 1951 he became keeper of the Orléans library. He also edited scholarly journals and in 1946 founded an influential literary review, *Critique*, which he edited until his death.

His first novel, on sexual excess, was published under a pseudonym, Lord Auch; it appeared in 1928 as *Histoire de l'oeil* (*The Story of the Eye*). As Pierre Angélique, another pseudonym, he wrote *Madame Edwarda* (1937). *Le Coupable* (1944; "The Guilty One") was the first major literary work published under his own name. *La Littérature et le mal* (1957; *Literature and Evil*) and *L'Érotisme* (1957; *Eroticism*) followed. He also wrote *Lascaux; ou, la naissance de l'art* (1955; *Lascaux; or, The Birth of Art*) and *Manet* (1955). A novel, *Ma Mère* (*My Mother*), was published in 1966.

The complete works (*Oeuvres complètes*) of Bataille, published between 1970 and 1988, occupy 12 volumes.

Bataille, (Félix-)Henry (b. April 4, 1872, Nîmes, Fr.—d. March 2, 1922, Rueil-Malmaison), French dramatist whose luxuriant plays of passionate love and stifling social conventions were extremely popular at the beginning of the 20th century.

Bataille's parents died when he was very young, and, having shown talent for both painting and poetry at school, he turned to writing by the age of 14. After several false starts his successful career began with *L'Enchantement* (1900), followed by such works as *Maman Colibri* (1904); *La Femme nue* (1908; "The Nude Woman"), considered by many his best play; and *La Vierge folle* (1910; "The Foolish Virgin"). The combination of sonorous, exaggerated language and explicit social messages soon dated his plays. Even though his art evolved toward the theatre of ideas and, later, toward social drama, as in *La Chair humaine* (1922; "Human Flesh"), his later works were less successful. His theory of "indirect language," capable of betraying or concealing a character's subconscious desires, although largely unapplied in his own work, makes him a forerunner of Jean-Jacques Bernard and the "school of silence."

Bataisk, also spelled BATAJSK (Russia): see Bataysk.

Batak, also spelled BATAK, or BATA, several closely related ethnic groups of central Sumatra, Indonesia. They possess a written language of their own, consisting of several diverse dialects, belonging to the Austronesian family. The Batak are descendants of a powerful Proto-Malayan people who until 1825 lived in relative isolation in the highlands surrounding Lake Toba in Sumatra.

The Batak had felt Indian influences by the

Batak village, Sumatra
Marc Riboud—Magnum

2nd or 3rd century AD and had borrowed ideas of government, writing, elements of religion, arts, and crafts. They did not, however, develop a unified state and today are found in six cultural divisions. Within these are exogamous patrilineal clans known as *marga*. A price is paid for a bride, who then becomes a member of her husband's group. Among the Toba Batak a village consists of several clan houses, but in the Karo division all dwell in one or more longhouses.

Ancestors, plants, animals, and inanimate objects are considered to possess souls or spirits that can be coerced or enticed by male priests. These priests are aided by female mediums who, in trance, communicate with the dead. Cannibalism was once practiced, but victims were confined to prisoners and those guilty of incest.

Today most of the Toba Batak are literate, as is the case of many in the other groups. Many are Christians who occupy places of importance in trade and in the Indonesian government. Muslim missionaries have been active in regions to the north and south of the Toba. The estimated population of Batak lands is about 3,100,000, of which about one-third is Christian, one-third Muslim, and the balance still adherents of traditional beliefs.

After World War II there was a mass movement of Toba squatters into the rich plantation lands of the east coast, formerly owned by foreign investors.

Batak Protestant Christian Church, also called HURIA KRISTEN BATAK PROTESTANT (HKBP), church in northern Sumatra, Indon., organized as an independent church in 1930 and constituting the largest Lutheran church in Asia. It developed from the work of missionaries of the Rhenish Mission Society, established in Barmen, Ger., in 1828. Under the leadership of the German Lutheran missionary Ludwig Ingwer Nommensen, the missionaries began working among the Batak people in Sumatra in 1862. Resistance to Christianity lessened slowly, and by 1880 entire tribes and villages began converting to Christianity. Nommensen translated Luther's Small Catechism, the New Testament (1878), and several other works into the Batak language and wrote hymns and a church order for the Batak church. By 1894 the entire Bible had been translated. Education was stressed, and many elementary schools were established in the villages. A Batak mission society extended the mission work among the people.

After the HKBP was organized in 1930, the foreign missionaries began withdrawing; the last of them departed in the 1940s, during World War II and the Indonesian war for independence from The Netherlands. The HKBP was accepted as a member of the Lutheran World Federation in 1952.

The church is divided into districts, each headed by a superintendent. The superinten-

dents make up the church council headed by an *ephorus* (bishop), who is elected for a specified term of office.

Batāla, city, Punjab state, northwestern India. Located northeast of Amritsar, Batāla is an agricultural marketplace and industrial centre. Cotton ginning, weaving, sugar refining, and manufacturing are the principal industries. Batāla has two colleges and is linked by road and rail with Amritsar and other cities in Punjab. Pop. (1991) city, 86,006; metropolitan area, 103,367.

Batalha, town and *concelho* (township), Leiria district, west-central Portugal, just south of Leiria city. The town is dominated by the great Dominican abbey of Santa Maria da Vitória, also known simply as Batalha ("Battle"). In the Battle of Aljubarrota, fought on a plain 9 miles (14 km) southwest of the town, John I of Portugal defeated John I of Castile in 1385 and secured the independence of his kingdom. The abbey was probably founded in 1388 to commemorate the victory. The Founder's Chapel contains the tomb of the victor, John I, and Philippa of Lancaster, his English queen, as well as the tomb of Henry the Navigator, their son. Other monarchs are buried in the royal mausoleum. Only the royal cloister, church, and Founder's Chapel were included in the original design by Afonso Domingues, a native architect. The Capelas Imperfeitas (Unfinished Chapels) are among the best examples of Manueline architecture.

Dominican Abbey of Santa Maria da Vitória, Batalha, Port.

Inge Morath—Magnum

This style of architecture, which was named for the monarch Manuel (reigned 1495–1521) and which flourished in the 16th century, employed decorative stonework, using nautical, angelic, and military motifs. The catastrophic earthquake of 1755 damaged the abbey, and the French sacked it in 1810. Secularized in 1834, it was declared a national monument in 1840 and was gradually restored. Pop. (1991 prelim.) town, 3,152; *concelho*, 13,018.

Batan Islands, chain of 14 islands in the Philippines, about 190 miles (310 km) north of Luzon in the Luzon Strait. Their total area is 81 square miles (209 square km). The Bashi (north) and Balintang (south) channels separate the group from Taiwan and the Babuyan Islands.

Volcanic in origin, the islands are rugged and rocky, but relatively flat and windswept. Only the four largest (Itbayat, Batan, Sabtang, and Ibohos) are inhabited. The frequency of destructive typhoons dictates both agricultural and architectural patterns. Root crops, particularly sweet potatoes, are the main food crop, and the surplus supports a small livestock industry. Fishing is a supplementary activity. Houses are built of stone and tile in the shelter of swales or trees.

The inhabitants are Roman Catholic and speak Ivatan, a local dialect. Population in-

crease since 1900 has been very slight, since the islanders have steadily migrated to the kinder environment of Luzon. The town of

Batan Islands

Basco, on northwestern Batan Island, is the only national port; it is served by an airfield. Pop. (1990 est.) 14,435.

Batangas, city, southern Luzon, Philippines. It lies in a small plain on the west bank of the Calumpang River about 1 mile (1.6 km) from the coast of Batangas Bay, which issues through straits ultimately into the South China Sea. The city is connected with Manila, about 70 miles (110 km) north, by good roads and by coastwise shipping and is the northern terminus of regular ferry service to Calapan, Mindoro.

Batangas is a trade and food-processing centre for an agricultural area made fertile by volcanic soil—rice, sugarcane, and coconuts being the major crops and beef cattle the major livestock. The city also has fisheries and an oil refinery. At the nearby village of Santa Rita are lumber mills. The Pablo Borbon Memorial Institute of Technology was founded there in 1903. Pop. (1990 prelim.) 184,000.

Batavi, ancient Germanic tribe from whom Batavia, a poetic name for The Netherlands, is derived. The Batavi inhabited what is now the Betuwe district of The Netherlands, around Lugdunum Batavorum (Leiden), at the mouth of the Rhine River. Subjugated by Rome in AD 12, they became an "allied people" (*gens foederata*) and furnished troops for the Roman army until their rebellion under Gaius Julius Civilis (AD 69–70). In the 4th century the Salian Franks displaced the Batavi.

Batavia (Indonesia): see Jakarta.

Batavia, city, seat (1802) of Genesee county, northwestern New York, U.S. It lies along Tonawanda Creek, midway between Buffalo (west) and Rochester (33 miles [53 km] east). Batavia is a distribution point and trade centre for a dairy, poultry, and truck-farm region and has some industry, including the manufacture of shoes, paper, die castings, and radio

and television sets. A New York state school for the blind was established there in 1868. The Tonawanda Indian Reservation is located 13 miles (21 km) northwest, and Attica Correctional Facility lies 11 miles (18 km) south. Genesee Community College was opened in 1966. Inc. village, 1823; city, 1914. Pop. (1990) 16,310.

Batavian Republic, French RÉPUBLIQUE BATAVE, Dutch BATAAFSE REPUBLIEK, republic of the Netherlands, established after it was conquered by the French during the campaign of 1794–95. Set up in April 1798, it possessed a government patterned after that of the Directory in France and was bound to France by alliance. In March 1805 Napoleon changed the system of government once more: the Batavian Republic was renamed Batavian Commonwealth, and executive power was given to a kind of dictator called the council pensionary. In June 1806, however, the Batavian Commonwealth was replaced by the Kingdom of Holland under Napoleon's brother Louis; this monarchy lasted until July 1810, when Holland was incorporated into the French Empire.

Bataysk, also spelled BATAJSK, or BATAISK, city, Rostov oblast (province), southwestern Russia, just south of Rostov-na-Donu. It is a transport centre in the northern Caucasus and a main rail junction, with railway shops and freight yards: over 20 percent of the labour force is in transportation. Other important industries are metalworking and aircraft manufacture, and Bataysk is also a grain, livestock, and food centre. It became a city in 1938. Pop. (1991 est.) 93,300.

Batchelor, Joy: see Halas, John; and Batchelor, Joy.

Bătdâmbâng, also spelled BATTAMBANG, town, western Cambodia. It is the second largest urban area in Cambodia and lies along the Sângkê River northwest of Phnom Penh, the national capital. From 1794 to 1904 and again from 1941 to 1946 the town was under Siamese sovereignty. Bătdâmbâng had a substantial Chinese trading community until the Khmer Rouge government took control in 1975. Among its industries are a textile mill and rice mills; there is also a rice research station. Bătdâmbâng is linked to Phnom Penh both by railway and by flights from its major airfield. Cultural assets include the Buddhist temple Wat Poveal and 10th-century ruins of the Khmer empire, including several temples. Pop. (1987 est.) 45,000.

Bate, W(alter) Jackson (b. May 23, 1918, Mankato, Minn., U.S.—d. July 26, 1999, Boston, Mass.), American author and literary biographer known for his studies of the English writers John Keats and Samuel Johnson.

Educated at Harvard University, Bate taught history and literature there from 1946 and was chairman of the department of English from 1956 to 1962.

In 1945 the Modern Language Association published Bate's *Stylistic Development of Keats*. His *John Keats* (1963) was awarded the Pulitzer Prize for Biography in 1964. In 1955, *The Achievement of Samuel Johnson* was awarded the Gauss Prize for literary history and criticism. *Samuel Johnson* (1977), a colourful account of Johnson's personality and a vivid portrayal of the times in which he lived, won the acclaim of scholars and critics and was awarded the 1978 Pulitzer Prize and the National Book Award.

Bate's other works include *From Classic to Romantic* (1946) and *Coleridge* (1968).

bateleur (species *Terathopius ecaudatus*), small eagle of Africa and Arabia, belonging to the subfamily Circaetinae (serpent eagles) of the family Accipitridae. The name bateleur (French: "tumbler") comes from the birds' distinctive aerial acrobatics. About 60 cm (2 feet)

long, the bateleur has a glossy black head, neck, and underparts; a reddish brown back; whitish to red-brown shoulders; a bare red face; and powerful red-orange feet. Its tail is only 10 cm (4 inches) long (longer in young birds), and its wings, black above and white beneath, are long, pointed, and exceptionally wide. A short full crest makes the bird's head appear large. One of the most familiar birds of the African skies, it is almost constantly on the wing. Often it turns somersaults in the air, claps its wings loudly, utters cawing or barking cries, and dives with a screaming sound. It hunts open country for small mammals, reptiles, eggs, grasshoppers, and carrion. It seems to favour snakes.

A leaf-lined stick nest is built in a low, spreading tree. The clutch is probably a single egg; the female incubates, for 40 days or more. The young do not fledge until three or four months after hatching. Maturity is reached in the fifth or sixth year.

Bateman, H(ezekiah) L(inthicum) (b. Dec. 6, 1812, Baltimore, Md., U.S.—d. March 22, 1875, London, Eng.), actor and theatrical manager who made a great success touring the United States and England with two of his daughters, both child actresses.

Bateman made his stage debut in 1832 and acted in various repertory companies until 1849. Then he, his wife, Sidney Frances, and his two eldest daughters, Kate and Ellen, aged six and four, respectively, began to tour widely as stars. Later Ellen played Richard III, Shylock, and Macbeth to Kate's Richmond, Portia, and Lady Macbeth. In 1855 Bateman managed a St. Louis theatre and later, as Kate's manager, moved to New York City, where she was a hit in *Leah the Forsaken* (1863), Augustin Daly's version of Salomon Mosenthal's *Deborah*. The French company that Bateman presented in New York (1867–69) started a craze for light opera in the United States. In 1871 he leased the Lyceum Theatre, London, and engaged the actor Henry Irving, who won fame in Leopold Lewis' *Bells*.

Bateman's wife (1823–81), in addition to acting, also wrote plays, of which the most popular was *Self* (1857). After her husband's death, she managed the Lyceum and later Sadler's Wells Theatre. Ellen Bateman (1844–1936) married early and gave up the stage, but Kate (1842–1917) continued a long career of acting. She retired briefly in 1866, when she married George Crowe, but returned in 1868, later playing Lady Macbeth and other roles with Irving.

Bateman, H(enry) M(ayo) (b. Feb. 15, 1887, Sutton Forest, N.S.W., Australia—d. Feb. 13, 1970, Malta), cartoonist known for narrative cartoons and cartoons of situations involving social gaffes.

After studying drawing and painting, Bateman began drawing for publication in 1906. Before World War I his work had appeared in *Punch* and other publications. A notable series of cartoons consisted of a wordless sequence of drawings. One, dating from 1916 and captioned "Prisoner when arrested, clung to the railing . . .," showed the arrest of a soapbox orator; successive panels depicted increasingly forceful efforts to remove him from the fence railings, ending with the section of fence cut away and being carried off by the police with the orator still attached.

Another notable series involved the odd man out, a solitary figure that had just committed an unpardonable breach of convention, surrounded by an outraged crowd. One of these was captioned, "The Guest Who Called 'Pâté de Foie Gras' Potted Meat."

BIBLIOGRAPHY. Anthony Anderson, *The Man Who Was H.M. Bateman* (1982), is an illustrated biography.

Bateman, Hester, née NEEDHAM (b. 1709, London—d. 1794, London), silversmith noted

particularly for her domestic silver of elegant simplicity.

Her husband, John Bateman, who worked in gold and silver, particularly watch chains,

Silver coffee pot by Hester Bateman, 1773–74; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

died in 1760. The next year she took over the family business, registering her mark at the Goldsmiths' Hall, London. Initially she was assisted by two of her sons, John and Peter, and an apprentice. Until 1774 little Bateman work is known, largely because the shop was busy with work commissioned by other silversmiths. Thereafter, her shop became well known and successful, specializing in tableware, such as spoons, sugar bowls, salt cellars, and teapots. Energetic and shrewd in business, she also possessed exceptional skill and taste. Working with graceful, refined shapes, she characteristically used restrained decoration, most often in the form of beaded edges. In addition to domestic silver, she executed some large presentation pieces. After her retirement in 1790, the business was continued by other members of the family who, for a time, also produced outstanding silver.

Batemans Bay, coastal town and inlet of the Tasman Sea, southeastern New South Wales, Australia. The inlet, an estuary of the Clyde River, measures 4 by 5 mi (6 by 8 km). Sighted in 1770 by Capt. James Cook, it was named by him after the captain of the ship "Northumberland." The town, founded early in the 19th century, is on the southwest shore. Serving a district producing timber, vegetables, cheese, oysters, and crayfish, it is linked to Sydney (136 mi northeast) via the Prince's Highway and is a convenient resort for Canberra, 65 mi west-northwest. Pop. (1996) 9,568.

Bates, Edward (b. Sept. 4, 1793, Goochland County, Va., U.S.—d. March 25, 1869, St. Louis, Mo.), lawyer and Whig politician who joined the Republican Party before the U.S. Civil War and served as Abraham Lincoln's attorney general.

Educated largely at home, Bates moved from Virginia to Missouri in 1814 and shortly thereafter began the study of law. By 1816 he was practicing law in St. Louis. Over the next decade he served in a number of territorial and state offices. Elected in 1826 to a term in the U.S. House of Representatives, Bates was defeated in a bid for a Senate seat by followers of Democrat Thomas Hart Benton. As a Whig in a strongly pro-Andrew Jackson state, Bates also lost his reelection attempt in 1828 for another term in the House.

Although his career in national politics was

largely dormant for more than three decades, Bates served in the Missouri legislature, drew national attention as president of the River and Harbor Improvement Convention of 1847, and in 1850 declined appointment as secretary of war during the administration of Whig Millard Fillmore. After serving as president of the Whig convention of 1856, he broke with the party and joined the newly created Republican Party.

Bates had long been a free-soil advocate. He freed his own slaves, opposed the Kansas-Nebraska Bill, and spoke out against the admission of Kansas under the Lecompton constitution. As a Southern-born border-state politician, Bates attracted support for the 1860 Republican presidential nomination. His followers believed he could maintain party principles opposing the extension of slavery without alienating the South and provoking secession.

When Bates's presidential bid failed, the triumphant Lincoln offered his erstwhile rival a choice of Cabinet positions. Bates chose the attorney generalship and for a time exercised some influence in the administration. But he opposed the admission of West Virginia as a state, the subjugation of constitutional rights to military control, and the increasing power of the Radical Republicans. On Nov. 24, 1864—wary of a position in which he wielded little authority—Bates resigned as attorney general.

He returned to Missouri and fought the Radical Republicans in his home state by writing newspaper articles and letters to prominent citizens.

Bates, H(erbert) E(rnest) (b. May 16, 1905, Rushden, Northamptonshire, Eng.—d. Jan. 29, 1974, Canterbury, Kent), novelist and short-story writer of high reputation and wide popularity.

Bates gained his knowledge of rural English life as a country-town solicitor's clerk and sharpened his skill as a reporter of atmosphere and action as a provincial journalist. His early short stories, essays, and novels in the 1920s were highly praised, but he became well known as a writer about the countryside and the life of the agricultural labourer with *The Poacher* (1935); *A House of Women* (1936); *My Uncle Silas* (1940), widely enjoyed for its earthy, Rabelaisian humour; and *The Beauty of the Dead and Other Stories* (1941).

World War II made Bates famous. Commissioned as a writer for the Royal Air Force in 1941, as "Flying Officer X" he gained great popularity with *The Greatest People in the World* (1942) and *How Sleep the Brave* (1943), collections of stories that conveyed the feel of flying in wartime. Three novels published under his own name, *Fair Stood the Wind for France* (1944), about a British bomber crew forced down in occupied France, and two set in Burma during the Japanese invasion, *The Purple Plain* (1946) and *The Jacaranda Tree* (1948), earned Bates a new reputation as a novelist of power.

In his postwar novels and stories Bates reached the height of his powers. From *The Nature of Love* (1954) to *A Moment in Time* (1964) and *The Triple Echo* (1970), he developed consistently in subtlety, depth, and strength as a novelist, and in *The Darling Buds of May* (1958) he created a realistic, lovable farm family, the Larkins. *Colonel Julian* (1955) demonstrates his range in the short story, and the autobiographical *The Vanished World* (1969) and *The Blossoming World* (1971) show that he retained his power to capture the mood of the passing moment.

Bates, H(enry) W(alter) (b. Feb. 8, 1825, Leicester, Leicestershire, Eng.—d. Feb. 16, 1892, London), naturalist and explorer whose demonstration of the operation of natural selection in animal mimicry (the imitation by

a species of other life forms or inanimate objects), published in 1861, gave firm support to Charles Darwin's theory of evolution.

In 1844 Bates introduced the subject of entomology to Alfred Russel Wallace, who in

H.W. Bates, lithograph by W. Purkiss, c. 1880

BBC Hulton Picture Library

1847 suggested a trip to tropical jungles to collect specimens to sell at home and to collect data that might help solve the problem of the origin of species. On May 28, 1848, they arrived at Pará, Braz., near the mouth of the Amazon River. Wallace returned to England in 1852; Bates remained 11 years, exploring the entire valley of the Amazon, where he collected about 14,712 species, mostly of insects, 8,000 previously unknown. On his return to England (1859), he began work on his huge collections and the preparation of his famous paper, presented in 1861 as "Contributions to an Insect Fauna of the Amazon Valley." In 1864 Bates was appointed assistant secretary of the Royal Geographical Society (London) and held the position until his death. He wrote *The Naturalist on the River Amazons*, 2 vol. (1863), and many papers on entomology.

Bates, Katharine Lee (b. Aug. 12, 1859, Falmouth, Mass., U.S.—d. March 28, 1929, Wellesley, Mass.), author and educator who wrote the text of the national hymn "America the Beautiful."

She was educated at Wellesley College, Wellesley, Mass., where she taught English literature from 1885 to 1925. Among her many works are *The College Beautiful and Other Poems* (1887), *English Religious Drama* (1893), and *The Pilgrim Ship* (1926). Her *America the Beautiful and Other Poems* was published in 1911.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Batesian mimicry, a form of biological resemblance in which a noxious, or dangerous, organism (the model), equipped with a warning system such as conspicuous coloration, is mimicked by a harmless organism (the mimic). The mimic gains protection because predators mistake it for the model and leave it alone. This form of mimicry is named for its discoverer, the 19th-century English naturalist H.W. Bates. Compare Müllerian mimicry.

Bateson, William (b. Aug. 8, 1861, Whitby, Yorkshire, Eng.—d. Feb. 8, 1926, London), biologist who founded and named the science of genetics and whose experiments provided evidence basic to the modern understanding of heredity. A dedicated Darwinist, he cited embryo studies to support his contention in 1885 that chordates evolved from primitive echinoderms, a view now widely accepted. In 1894 he published his conclusion (*Materials for the Study of Variation*) that evolution could

not occur through a continuous variation of species, since distinct features often appeared or disappeared suddenly in plants and animals. Realizing that discontinuous variation could be understood only after something was

William Bateson, drawing by Sir William Rothenstein, 1917; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

known about the inheritance of traits, Bateson began work on the experimental breeding of plants and animals.

In 1900, he discovered an article, "Experiments with Plant Hybrids," written by Gregor Mendel, an Austrian monk, 34 years earlier. The paper, found in the same year by Hugo de Vries, Carl Correns, and Erich Tschermak von Seysenegg, dealt with the appearance of certain features in successive generations of garden peas. Bateson noted that his breeding results were explained perfectly by Mendel's paper and that the monk had succinctly described the transmission of elements governing heritable traits in his plants.

Bateson translated Mendel's paper into English and during the next 10 years became Mendel's champion in England, corroborating his principles experimentally. He published, with Reginald Punnett, the results of a series of breeding experiments (1905–08) that not only extended Mendel's principles to animals (poultry) but showed also that certain features were consistently inherited together, apparently counter to Mendel's findings. This phenomenon, which came to be termed linkage, is now known to be the result of the occurrence of genes located in close proximity on the same chromosome. Bateson's experiments also demonstrated a dependence of certain characters on two or more genes. Unfortunately, he misinterpreted his results, refusing to accept the interpretation of linkage advanced by the geneticist Thomas Hunt Morgan. In fact, he opposed Morgan's entire chromosome theory, advocating his own vibratory theory of inheritance, founded on laws of force and motion, a concept that found little acceptance among other scientists.

Bateson became, at the University of Cambridge, the first British professor of genetics (1908). He left this chair in 1910 to spend the rest of his life directing the John Innes Horticultural Institution, London, transforming it into a centre for genetic research. His books include *Mendel's Principles of Heredity* (1902) and *Problems of Genetics* (1913).

Batesville, city, seat (1821) of Independence county, north-central Arkansas, U.S. It lies in the foothills of the Ozarks on the White River. Named for James W. Bates, a territorial judge and U.S. congressman, it was founded (1812) by John Reed, who built a trading post at the mouth of Poke (now Polk) Bayou, where a fork of the Southwest Trail crossed the river. Ferry service began in 1818, and in 1831 the settlement became a steamboat shipping point for farm products. Poultry processing,

light manufactures, and lime and black marble quarries form its economic base. Arkansas College (1872; Presbyterian) was founded in 1836 as Batesville Academy. The White River Dam and Locks (1900) are nearby. Inc. town, 1841; city, 1846. Pop. (1990) 9,187.

batfish, any of about 60 species of fishes of the family Ogocephalidae (order Lophiiformes), found in warm and temperate seas. Batfishes have broad, flat heads and slim bodies and are covered with hard lumps and spines. Some species have an elongated, upturned snout. Batfishes grow at most about 36 cm (14 inches) long. They are poor swimmers and usually walk on the bottom on thickened, limblike pectoral and pelvic fins. Most live in the deep sea, but some inhabit shallow water.

Batfishes are members of the group known as anglerfish and are equipped with a "fishing pole," tipped with a fleshy "bait" to lure prey

Galapagos, or red-lipped, batfish (*Ogocephalus darwini*)

close enough to be eaten. The apparatus is located above the small mouth and, unlike that of other anglers, can be drawn into a tube when not in use.

Bath, district and city, county of Avon, England. Bath lies along the River Avon in a natural amphitheatre of steep hills. Built of local limestone, it is one of the most elegant and architecturally distinguished of British cities. Its 16th-century abbey church of St. Peter and St. Paul is late Perpendicular Gothic and is noted for its windows, but it is the wealth of classical Georgian buildings mounting the steep valley sides that gives Bath its distinction.

Georgian buildings in Bath, Eng.

Will & Deni McInlyre/AllStock

The hot mineral springs (120° F [49° C]) on the site attracted the Romans, who founded Bath as *Aquae Sulis*, dedicated to the deity Sul (Minerva). The Saxons built an abbey on the site at which Edgar, first king of all England, was crowned (AD 973). The Normans subsequently rebuilt the church between 1088 and 1122, transferring there the diocese they had founded at Wells. The bishop's throne returned to Wells in 1206, and there was a long rivalry between the canons of Wells and the monks of Bath, of which the bishop was titular abbot. The diocese is still styled Bath and Wells.

Incorporated by charter in 1189, medieval Bath shared in the west-of-England wool trade and later in the cloth trade, but the baths, although still used by royalty, were poorly

maintained. When the Roman bath, lined with lead from the nearby Mendip Hills, was rediscovered in 1755, Bath had already revived as a spa. In its heyday as a fashionable resort—presided over by the social figure Richard "Beau" Nash, one of the greatest English dandies—the Elizabethan town was rebuilt and extended in Palladian style by the architects John Wood the Elder and Younger and their patron, Ralph Allen, who provided the stone from his local quarries and built the mansion of Prior Park (1735–43) outside the city. In 1769–74 Robert Adam built Pulteney Bridge to connect Bath with the new suburb of Bathwick across the River Avon.

Close to the abbey, in the entrenched valley of the River Avon, is the 18th-century Pump Room, giving access to the hot springs and Roman baths. Among some 140 historic terraces and individual buildings that grace the city are Queen Square, built by John Wood the Elder between 1728 and 1735; the Circus, begun by Wood in 1754 and completed by his son; the Royal Crescent, 1767–75; the Guildhall, 1775; Lansdown Crescent, built by John Palmer, 1796–97; and the 1795 pavilion in Sydney Gardens, Bathwick, which now houses the Holburne of Menstrie Museum of Arts collection. In 1942 the Assembly Rooms of 1771 were destroyed in an air raid from which the whole city suffered severely, but extensive reconstruction, as well as renovation, has since been carried out. The Assembly Rooms, reopened in 1963, now contain a comprehensive 18th- and 19th-century costume collection. Claverton Manor, 2 miles (3 km) outside the city, is an early 19th-century mansion housing the American Museum in Britain, a large museum of Americana.

As the leading centre of English high society outside London in the 18th and early 19th centuries, the city is rich in literary associations. The life of the time is graphically depicted in the novels of Tobias Smollett and in the plays of Richard Brinsley Sheridan. Jane Austen's novels *Northanger Abbey* and *Persuasion* (both 1817/18) portray with delicate satire and keen perception the fashionable life of Bath about 1800. Bath Olivers (biscuits that take their name from William Oliver, an eminent physician who founded what is now the Royal National Hospital for Rheumatic Diseases), Bath buns, Bath bricks, and Bath (invalid) chairs all derive their names from the city.

Although not primarily a manufacturing centre, Bath nevertheless has considerable printing and bookbinding, light engineering, and clothing industries. Pop. (1991) 84,600.

Bath, city, port of entry (since 1789), seat (1854) of Sagadahoc county, southwestern Maine, U.S. The city lies along the Kennebec River near its mouth on the Atlantic coast, 36 miles (58 km) northeast of Portland. Settled about 1670 and named for the English city, it was part of Georgetown until incorporated as a separate town in 1781. Its shipbuilding industry (exemplified in the Bath Marine Museum) dates from 1762, when Captain William Swanton launched the *Earl of Bute*. The Bath Iron Works (founded 1833 and the city's

The Bath Iron (shipbuilding) Works, Bath, Maine

Gordon A. Reims

main economic asset) has been building ships since 1889, reaching peak naval production during the world wars. Inc. city, 1847. Pop. (2000) 9,266.

Bath, town, Beaufort county, eastern North Carolina, U.S., on the Pamlico River estuary. The first proprietary grant in the area (1684) embraced the townsites then occupied by an Indian village called Pamlico. Settled by the English (1695), it became the seat of old Bath county (formed 1696 and named for the Earl of Bath) and was the colony's first incorporated town (1705). Survivors of

The Bonner House in Bath, N.C.
Mitt and Joan Mann from CameraMann

the Tuscarora (Indian) War (1711–13) found refuge there, and the pirate Edward Teach, known as Blackbeard, made it his headquarters. It served as the colony's first official port of entry. Surviving colonial buildings include St. Thomas Episcopal Church (c. 1734) and the Bonner and Palmer-Marsh houses. The town was designated a state historic site in 1963. Pop. (2000) 275.

bath, process of soaking the body in water or some other aqueous matter such as mud, steam, or milk. The bath may have cleanliness or curative purposes, and it can have religious, mystical, or some other meaning (see ritual bath).

The bath as an institution has a long history. Writings from ancient biblical and other sources mention baths. Architectural remains from ancient Egypt indicate the existence of special bathrooms, and both vase paintings and restored ruins show that the Greeks of classical antiquity thought the bath important. Roman baths featuring a combination of steaming, cleaning, and massage appeared wherever the Romans made conquests. In Rome itself the aqueducts fed sumptuous baths such as those of Caracalla, which covered 28 acres (11 hectares).

By medieval times in Europe the luxurious baths of ancient Rome had given way to more primitive facilities with purely curative or hygienic purposes. Public baths were built as early as the 12th century. In the 14th and 15th centuries public bathhouses and garden baths or pools accommodated men and women together. In the 1600s many persons visited spas to take baths, sometimes remaining submerged for health purposes for days at a time.

Modern baths have taken many forms. In some cases they have combined features from many types of older baths, including the Turkish bath and the Japanese tub bath, or *furo*. In the 20th century the medicinal bath using a special tub or pool developed separately from the home bathtub or shower stall. The medicinal bath may use special waters, such as carbonated or chemically treated waters, at high or low temperatures.

bath (unit of measure): see bat.

Bath, The Most Honourable Order of the, order of British knighthood established by King George I in 1725, conferred as a reward either for military service or for exemplary civilian merit. Like most chivalric orders, it had antecedents in much earlier tra-

ditions. Bathing as a purification ritual was probably introduced in a religious context with knighthood in the 11th century. From the coronation of Henry IV (1399)—according to tradition, the founder of the order—to the coronation of Charles II (1661), it became customary to create a certain number of knights at important royal ceremonies. The medieval “knights of the bath” took precedence over knights bachelor, from whose ranks they had been promoted, but they never formed an order of chivalry. When George I created the order, he believed that he was reviving an ancient order that had, in fact, never existed.

Originally membership comprised the British monarch and 36 knights. Membership regulations have undergone numerous changes over the centuries. The order currently includes the monarch, members of the royal family, foreigners (known as “honorary members”), and members organized in three classes. These include two classes of knights with more than 400 members (the knights or dames grand cross and the knights or dames commanders) as well as a class known as companions, with some 1,800 members. Women are admitted to all classes of the order.

The knights grand cross are allotted stalls in the order's chapel, Henry VII Chapel in Westminster Abbey, where their banners, crests, and coats of arms are affixed. The badge of the order depicts three crowns with the order's Latin motto “Tria juncta in uno” (“Three joined in one”), as well as the German motto “Ich dien” (“I serve”), and emblems of England, Scotland, and Ireland (rose, thistle, and shamrock, respectively).

Bath, EARLS AND MARQUESSSES OF, titled English nobility, notably in the families Pulteney and Thynne, grouped below chronologically and indicated by the symbol ●.

●**Bath, William Pulteney, 1st Earl of, VISCOUNT PULTENEY OF WRINGTON, BARON OF HEDON** (b. March 22, 1684, London, Eng.—d. July 7, 1764, London), English Whig politician who became prominent in the opposition to Sir Robert Walpole (first lord of the treasury and chancellor of the Exchequer, 1721–42), after being staunchly loyal to him for 12 years, up to 1717. A scholarly and versatile man and a brilliantly satirical orator, Pulteney was himself three times in a position to form a government but failed to do so.

A member of the House of Commons from 1705 to 1742 (when he was created an earl), Pulteney served as secretary at war (1714–17). When Walpole came to power in 1721, Pulteney was not given high office, and his subsequent failure (1724) to obtain the secretaryship of state embittered him and prompted him to charge Walpole with corruption. As a leader of the anti-Walpole Whigs, he joined the 1st Viscount Bolingbroke in trying to form a united party of opposition and in publishing a political newspaper, *The Craftsman* (1726–36). Pulteney's journalism and brilliant parliamentary speeches encouraged Whig and Tory opponents of Walpole to form an alliance.

Pulteney's career lost its momentum in 1735, when Bolingbroke retired from politics and the Whig-Tory combination against Walpole disintegrated. When Walpole fell from power in 1742, Pulteney declined two requests by King George II to form a government, accepting instead the first lordship of the treasury and the earldom of Bath, thus alienating many of his supporters. He left office in 1743, and Henry Pelham, an old enemy of Bath, became prime minister. In 1746 Bath participated in an attempt to organize a government; its failure terminated his political life.

●**Bath, Thomas Thynne, 1st Marquess of, VISCOUNT WEYMOUTH, BARON THYNNE OF WARMISTER** (b. Sept. 13, 1734—d. Nov. 19, 1796, London, Eng.), politician who, as 3rd Viscount Weymouth, held important of-

fice in the British government during two critical periods in the reign of George III. Although he was an outstanding orator, his dissolute habits (gambling and heavy drinking), indolence, and secretiveness prevented him from realizing his potential as a statesman.

Appointed viceroy of Ireland in June 1765, Weymouth resigned two months later. In his first term as secretary of state for the southern department (1768–70), he had to maintain public order during the riots protesting the imprisonment of John Wilkes, politician and advocate of freedom of the press. For approving the use of troops leading to a massacre at St. George's Fields (May 10, 1768), he became extremely unpopular and was denounced by Wilkes himself. After four more years (1775–79) as secretary of state for the southern department, he retired because he opposed Prime Minister Lord North's Irish policy and Britain's role in the American Revolution. He was created marquess in 1789.

Bath's estate, Longleat, in Wiltshire, is a major work of the landscape gardener Lancelot (“Capability”) Brown.

Bath and North East Somerset, unitary authority, geographic and historic county of Somerset, southwestern England. It lies just southeast of Bristol and encompasses the city of Bath, several towns between Bath and Bristol, and the countryside to their southwest.

Bath is the unitary authority's only city. The Romans founded the town at the site of hot mineral springs. The city thrived as a centre of the wool and cloth trades during the Middle Ages and as a fashionable resort during the 18th and 19th centuries.

The unitary authority comprises gently rolling hills and valleys, including a section of the River Avon and the southernmost of the limestone Cotswold Hills in the north and the limestone Mendip Hills in the southwest. Dairy and some beef cattle graze the fertile valley pastures; cereals and fodder crops are also produced. There is light industry at Norton-Radstock, a former coal-mining town in the south. Keynsham, between Bath and Bristol, produces chocolates, soap, and paper products. Keynsham and Bath both serve as administrative centres. Area 136 square miles (351 square km). Pop. (1998 est.) 167,300.

bath chair, chair on wheels intended for use by ladies and invalids. It was devised by James Heath, of Bath, Eng., about 1750. Over the next three-quarters of a century, it gradually superseded the sedan chair as a form of conveyance in Great Britain. The most common variety rested on two wheels joined by an axle beneath the seat, with a small pivoting wheel in front supporting the footrest.

The chair could be pushed from behind and steered by a long curved rod connected to

Bath chair

By courtesy of the Bath Municipal Libraries, England

the front wheel and controlled by the occupant. The whole conveyance was designed on flowing lines. The chair was especially popular at seaside resorts during Victorian times.

Ba'th Party, in full ARAB SOCIALIST BA'TH PARTY, OR ARAB SOCIALIST RENAISSANCE PARTY, Arabic *Ḥizb al-Ba'th al-'Arabī al-Ishṭirākī*, Ba'th also spelled BA'ATH, Arab political party advocating the formation of a single Arab socialist nation. It has branches in many Middle Eastern countries and was the ruling party in Iraq (1968–2003) and in Syria (1963–).

The Ba'th Party was founded in 1943 in Damascus by Michel 'Aflaq and Ṣalāḥ ad-Dīn al-Bīṭār, adopted its constitution in 1947, and in 1953 merged with the Syrian Socialist Party to form the Arab Socialist Ba'th (Renaissance) Party. The Ba'th Party espoused nonalignment and opposition to imperialism and colonialism, took inspiration from what it considered the positive values of Islām, and attempted to ignore or transcend class divisions. Its structure was highly centralized and authoritarian.

The Syrian Ba'thists took power in 1963, but factionalism between "progressives" and "nationalists" was severe until 1970, when Ḥafīz al-Assad of the "nationalists" secured control. In Iraq the Ba'thists took power briefly in 1963 and regained it in 1968, after which the party's power became concentrated under Iraqi leader Saddam Hussein. Differences between the Iraqi and Syrian wings of the Ba'th Party precluded unification of the two countries. Within both countries the Ba'thists formed fronts with smaller parties, including at times the communists. In Syria the main internal threat to Ba'th hegemony stemmed from the Muslim Brotherhood, while in Iraq Kurdish and Shī'ite opposition was endemic. The Iraqi party was overthrown in the Second Persian Gulf War (q.v.).

Bathinda (India): *see* Bhatinda.

batholith, large body of igneous rock formed beneath the Earth's surface by the intrusion and solidification of magma. It is commonly composed of coarse-grained rocks (e.g., granite or quartz diorite) with a surface exposure of 100 square km (40 square miles) or larger. A batholith has an irregular shape with side walls that incline steeply against the host rock. Most batholiths intrude across mountain folds and are elongated along the dominant axis of the range; faulting and contact metamorphism of the enveloping rock near the batholith is also observed. Although batholiths were once believed to extend to unknown depths, recent studies have shown that many of them have a thickness of 10 to 15 km (6 to 9 miles).

Bathonian Stage, the 7th of 11 divisions (in ascending order) of the Jurassic System, representing all those rocks deposited worldwide during the Bathonian Age (176 to 169 million years ago). The stage's name is derived from the city of Bath in the county of Avon, England. The rock units that make up this stage in England include about 130 m (426 feet) of strata from the upper part of the limestone known as the Great Oolite, together with the lower part of the overlying limestone known as the Cornbrash Beds. *Tulites subcontractus* is a typical fossil ammonite cephalopod found in the Bathonian section of the oolite strata. The biozone of the ammonite *Clydoniceras discus* in the Cornbrash Beds marks the top of the Bathonian in England and Europe. The Bathonian is overlain by the Callovian Stage and is underlain by the Bajocian Stage.

Báthory, Sigismund, Hungarian ZSIGMOND BÁTHORY (b. 1572—d. 1613, Prague, Bohemia, Austrian Habsburg domain [now in Czech Republic]), prince of Transylvania

whose unpopular anti-Turkish policy led to civil war.

The son of Christopher Báthory (prince of Transylvania, 1575–81) and nephew of Stephen (István Báthory, king of Poland,

Báthory, copper engraving by Egidius Sadeler, 1607
By courtesy of the National Széchényi Library, Budapest, Hungary

1575–86), Sigismund succeeded his father in 1581 and actually assumed control of government affairs in 1588. Acting on the advice of his foreign counselor Alfonso Carrillo, Báthory reversed the traditional policy of Transylvania (i.e., to play off the Ottoman sultan against the Holy Roman emperor and thereby preserve Transylvanian de facto independence) and adopted an anti-Turk position. Although this policy shift provoked a rebellion, which was not suppressed until 1595, he nevertheless joined the princes Aaron of Moldavia and Michael the Brave of Wallachia in an alliance against the Turks in 1594 and conquered Wallachia for Michael after defeating an Ottoman army at Giurgiu (in present-day Romania; Oct. 25–27, 1595).

Báthory, a Roman Catholic, became increasingly active in the Counter-Reformation, to the dismay of the leading Transylvanian nationalists, most of whom were Protestant. In 1599 he decided to take holy orders; he separated from his wife, the archduchess Christina of Austria, and gave up his throne, offering it to the Habsburg emperor Rudolf II (also king of Hungary) in exchange for the Silesian duchy of Oppeln (Opole). Rudolf, however, supported Michael the Brave, who defeated Báthory's son Andreas and declared himself prince of Transylvania. Báthory tried to recover his throne in 1600 and again in 1601, but on both occasions he was driven out by Michael, and he died in obscurity.

Báthory, Stephen: *see* Stephen Báthory.

bathos (from Greek *bathys*, "deep"), unsuccessful, and therefore ludicrous, attempt to portray pathos in art, i.e., to evoke pity, sympathy, or sorrow. The term was first used in this sense by Alexander Pope in his treatise *Peri Bathous*; or, *The Art of Sinking in Poetry* (1728). Bathos may result from an inappropriately dignified treatment of the commonplace, the use of elevated language and imagery to describe trivial subject matter, or from such an exaggeration of pathos (emotion provoked by genuine suffering) as to become overly sentimental or ridiculous.

Even great poets occasionally lapse into bathos. William Wordsworth's attempt to arouse pity for the old huntsman in "Simon Lee" is defeated by the following lines:

Few months of life has he in store
As he to you will tell,
For still, the more he works, the more
Do his weak ankles swell.

Bathsheba, also spelled BETHSABEE, in the Old Testament (2 Samuel 11, 12; 1 Kings 1, 2), wife of Uriah the Hittite; she later became one of the wives of King David and the mother of King Solomon.

Bathsheba was a daughter of Eliam and was probably of noble birth. A beautiful woman, she was seduced by David and became pregnant. David then had Uriah killed and married her. Their first child died, but Bathsheba later gave birth to Solomon. When David was dying, Bathsheba successfully conspired with the prophet Nathan to block Adonijah's succession to the throne and to win it for Solomon. Strong-willed and fearless, she occupied an influential position as the queen mother.

Bathurst, city, east-central New South Wales, Australia. It lies on the south bank of the Macquarie River, west of the Blue Mountains. Founded in 1815 and named after the 3rd Earl Bathurst, then secretary for war and the colonies, it is the oldest settlement west of the Great Dividing Range. Initially its growth was slow, but the population increased rapidly following the announcement of the discovery of gold in the vicinity in 1851. Declared a town in 1833, Bathurst was proclaimed a borough in 1862 and became a city in 1885.

Bathurst is now the service centre of a district producing sheep, grains, timber, fruits, and vegetables. Its industries include railway and precision-engineering works, flour mills, and canning, clothing, footwear, plastics, furniture, and ceramics plants. Bathurst lies at the junction of the Mitchell and Mid and Great Western highways and on the main rail line to Sydney (100 miles [160 km] southeast). It is a popular centre for motor racing (auto and motorcycle) and the site of Mount Panorama motor-racing circuit. The city has Roman Catholic and Anglican cathedrals, a memorial carillon tower, and the Mitchell College of Advanced Education (1970). Pop. (2001) 29,702.

Bathurst, city, seat (1826) of Gloucester county, northeastern New Brunswick, Canada. It lies at the mouth of the Nepisiguit River, on Bathurst Harbour, a southern arm of Nepisiguit Bay. The original French settlement (1619), was called Nepisiguit and then St. Peters. After 1755 the British displaced the French, and in the 1820s the community was renamed to honour the 3rd Earl Bathurst, then secretary for war and the colonies.

The city's economy is based mainly upon lumbering and fishing. A pulp mill was built in the early part of the 20th century, and the manufacture of pulp and boxboard continues to be the major industry. Since 1953 the mining of local base-metal ore deposits has been of growing significance. The Sacred Heart Church became a cathedral in 1942 after the episcopal see was transferred from Chatham. Youghal Beach, a popular summer resort on Nepisiguit Bay at the entrance to Bathurst Harbour, is about 7 miles (11 km) north. Inc. town, 1912; city, 1966. Pop. (2001) 12,924.

Bathurst (The Gambia): *see* Banjul.

Bathurst (of Bathurst), Henry Bathurst, 3rd Earl, BARON BATHURST OF BATTLESDEN, LORD APSLEY, BARON OF APSLEY (b. May 22, 1762—d. July 27, 1834, London, Eng.), British statesman, elder son of the 2nd Earl Bathurst, who was a prominent Tory in the late 18th and early 19th centuries.

Bathurst was member of Parliament for Cirencester from 1783 until he succeeded to the earldom in 1794. Mainly as a result of his friendship with William Pitt, he was a lord of the Admiralty (1783–89), a lord of the Treasury (1789–91), and commissioner of the Board of Control for India (1793–1802). Returning to office with Pitt in May 1804, he became master of the mint and was president of the Board of Trade and master of the mint during the ministries of the Duke of Portland and Spencer Perceval, vacating these posts in June 1812 to become secretary for war and the colonies under the Earl of Liverpool. For two months during 1809 he was in charge of the Foreign Office. He was secretary for war

and the colonies until Liverpool resigned in 1827 and deserves some credit for improving the conduct of the Peninsular War. As secretary for the colonies, Bathurst was closely concerned with the abolition of the slave trade. He was lord president of the council in the government of the Duke of Wellington from 1828 to 1830, favouring Roman Catholic emancipation but opposing the Reform Bill of 1832. He was made a knight of the Garter in 1817.

Bathurst Island, island in the Timor Sea, Northern Territory, Australia, separated from Melville Island to the east by Apsley Strait. Densely wooded, it is triangular and has an area of about 1,000 square miles (2,600 square km). The island was explored in 1818 by Phillip Parker King, who recommended it for European settlement, and was named after the 3rd Earl Bathurst, secretary for war and the colonies (1812–27). It later became the site of an Aboriginal reserve and of a large Roman Catholic mission. The island was the target of the first Japanese bombing attack against Australia in 1942. In 1978 ownership of the island passed from the crown to the Tiwi Land Council of tribal representatives. Cattle and varied crops are raised. Pop. (1996) 1,194.

Bathurst Island, one of the Parry Islands in the Baffin region, Nunavut, Canada, in the Arctic Ocean between Cornwallis and Melville islands. Bathurst Island is 160 miles (260 km) long and 50–100 miles (80–160 km) wide and has an area of 6,194 square miles (16,042 square km). The highest point is about 1,500 feet (457 m). Its northern coastline is deeply indented by Erskine and May inlets. The entire coastline is fringed with islets, and several islands stretch in a northwesterly direction from its western tip. Discovered in 1819 by Sir William Parry, it was named for the 3rd Earl Bathurst, then secretary for war and the colonies. The north magnetic pole is located off the island's northern coast. The island has no permanent population.

bathyal zone, marine ecologic realm extending down from the edge of the continental shelf to the depth at which the water temperature is 4° C (39° F). Both of these limits are variable, but the bathyal zone is generally described as lying between 200 and 2,000 m (660 and 6,600 feet) below the surface.

Photosynthesis does not occur in bathyal waters as a rule, the zone being characteristically dark except in the clear, virtually lifeless waters of the tropics, where small amounts of sunlight can penetrate as deeply as 600 m (2,000 feet). Temperatures in high latitudes range from about 3° to –1° C (37° to 30° F). Elsewhere, normal temperatures range between 5° and 15° C (41° and 59° F), the western oceanic margins being warmer owing to currents from the equator and the eastern margins receiving colder boreal currents and experiencing upwelling. Salinities typically range between 34 and 36 parts per thousand in the bathyal zone, varying with local conditions of water-mass formation. Bathyal fauna reflect the generally narrow ranges of temperature and salinity that occur.

At bathyal depths, currents are exceedingly slow, and in many areas bathyal waters deeper than 1,000 m (3,280 feet) are essentially stagnant, resulting in low oxygen concentrations and impoverished faunal levels.

Although upwelling and countercurrents may create favourable conditions for fish and other aquatic life in some middle- to high-latitude areas, the number of individuals in a bathyal faunal assemblage is generally only about half as large as in shallow-water fauna. It has been demonstrated, however, that single-habitat species diversity is higher for bathyal fauna. It has been suggested that this condition is caused by the constancy of the bathyal environmental conditions, especially its temperature. Bottom dwellers in areas with

adequate circulation are adapted to local substrate conditions. Terrigenous bottoms near the continents support the most abundant suspension and mud-eating populations. Cold-water bathyal corals are found in sub-Arctic to equatorial regions.

Bathyal sediments are terrestrial, pelagic, or authigenic (formed in place). Terrestrial (or land-derived) sediments are predominantly clays and silts and are commonly coloured blue because of accumulated organic debris as well as bacterially produced ferrous iron sulfides. Coarser terrigenous sediments are also brought to the bathyal seafloor by sporadic turbidity currents originating in shallower areas. Where supplies of terrigenous materials are scarce, microscopic shells of phytoplankton (coccolithophorids) and zooplankton (foraminiferous and pteropods) fall through the water grain by grain, accumulating as white calcareous ooze deposits. Authigenic sediments result from the interaction of clay, feldspar, and volcanic-glass particles with seawater, forming the minerals glauconite, chlorite, phillipsite, and palagonite. These sediments are characteristically green because of their chlorite and glauconite contents.

bathymetry, measurement of ocean depth. The earliest technique involved lowering a heavy rope or cable of known length over the side of a ship, then measuring the amount needed to reach the bottom. Tedious and frequently inaccurate, this method yielded the depth at only a single point rather than a continuous measurement; inaccuracies arose because the rope did not necessarily travel straight to the bottom but instead might be deflected by subsurface currents or movements of the vessel.

A more satisfactory approach, though not without problems, is echo sounding, widely used today, in which a sound pulse travels from the vessel to the ocean floor, is reflected, and returns. By calculations involving the time elapsed between generation of the pulse and its return and the speed of sound in water, a continuous record of seafloor topography can be made. Most echo sounders perform these calculations mechanically, producing a graphic record in the form of a paper chart. Misleading reflections caused by the presence of undersea canyons or mountains plus variations in the speed of sound through water caused by differences in temperature, depth, and salinity limit the accuracy of echo sounding, though these problems can be met somewhat by crossing and recrossing the same area. Sonar has also been employed in bathymetric studies, as have underwater cameras.

bathyscaphe, navigable diving vessel developed by the Swiss educator and scientist Auguste Piccard (with assistance in later years from his son Jacques), designed to reach great depths in the ocean.

The first bathyscaphe, the *FNRS 2*, built in Belgium between 1946 and 1948, was damaged during 1948 trials in the Cape Verde Islands. Substantially rebuilt and greatly improved, the vessel was renamed *FNRS 3* and carried out a series of descents under excellent conditions, including one of 4,000 m (13,000 feet) into the Atlantic off Dakar, Senegal, on Feb. 15, 1954. A second improved bathyscaphe, the *Trieste*, was launched on Aug. 1, 1953, and dived to 3,150 m (10,300 feet) in the same year. In 1958 the *Trieste* was acquired by the United States Navy, taken to California, and equipped with a new cabin designed to enable it to reach the seabed of the great oceanic trenches. Several successive descents were made into the Pacific by Jacques Piccard, and on Jan. 23, 1960, Piccard, accompanied by Lieutenant Don Walsh of the U.S. Navy, dived to a record 10,916 m (35,810 feet) in the Pacific's Mariana Trench.

The bathyscaphe consists of two main components: a steel cabin, heavier than water and

resistant to sea pressure, to accommodate the observers; and a light container called a float,

FNRS 2, the first bathyscaphe, built between 1946 and 1948, designed by Auguste Piccard

Actualit

filled with gasoline, which, being lighter than water, provides the necessary lifting power. The cabin and float are closely linked. On the surface, one or more ballast tanks filled with air provide enough lift to keep the bathyscaphe afloat. When the ballast tank valves are opened, air escapes and is replaced by water, making the whole device heavy enough to start its descent. The gasoline is in direct contact with the seawater and so is compressed at a rate almost exactly in proportion to the prevailing depth. Thus, the bathyscaphe gradually loses buoyancy as it descends, and the speed of its descent tends to increase rapidly. To slow down or to begin the reascent, the pilot releases ballast that consists essentially of iron shot stored in silos and held in place by electromagnets.

bathysphere, spherical steel vessel for use in undersea observation, provided with portholes and suspended by a cable from a boat. Built by the American zoologist William Beebe and the American engineer Otis Barton, the bathysphere made its first dives in 1930. On June 11, 1930, it reached a depth of 400 m, or about 1,300 feet, and in 1932, Beebe and Barton reached 900 m, or about 3,000 feet. Through these dives, the bathysphere proved its qualities but also revealed weaknesses. It was difficult to operate and involved considerable potential risks. A break in the suspension cable would have meant certain death for the observers; surface waves and resulting

William Beebe's bathysphere

By courtesy of the New York Zoological Society

movement of the boat could have produced such a fatal strain. In light of these disadvantages, the bathysphere was supplanted by the safer, more maneuverable mesoscaphe and bathyscaphe.

bathythermograph, any of various oceanographic devices containing temperature- and pressure-sensitive elements and producing a continuous record of underwater temperature and pressure. Recoverable bathythermographs, lowered from a ship at rest or in motion, produce this record on a coated glass slide. Expendable types, often dropped from aircraft, radio back information from depths up to 300 m (1,000 feet) and are frequently employed in making surveys of large areas.

Bathyriscus, genus of trilobites (extinct arthropods) that provide a useful index fossil for the Middle Cambrian epoch of North

Bathyriscus, of Cambrian age

America (540 to 523 million years ago). In *Bathyriscus* the head segment is well developed, and marginal spines are present. The tail region is large and has many well-developed segments. Several species of *Bathyriscus* are recognized.

batik, method of dyeing in which patterned areas are covered with wax so they will not receive the colour. The method is used mainly on cottons and in the traditional colours of blue, brown, and red. Multicoloured and blended effects are obtained by repeating the dyeing process several times, with the initial pattern of wax boiled off and another design

Batik work, traditional Javanese pattern

applied before redyeing. The basic technique, originated at an unknown time, was appar-

ently practiced widely in Southeast Asia with local variations, as in Celebes Island, where the wax was applied with bamboo strips. In Java, by the mid-18th century, a small copper crucible with a handle and narrow applicator spout for applying the wax came into use, producing a much more elaborately patterned cloth; a further Javanese innovation was the wood-block wax applicator introduced in the 19th century. The Dutch imported both the cloth and the technique to Europe. Present machines for applying wax in traditional Javanese patterns may reproduce such effects of the hand process as the staining caused by fissures in the wax. *See also* resist printing.

Bāṭinah, Al-, narrow, well-populated coastal plain, northeastern Oman, fronting the Gulf of Oman for about 150 miles (240 km) and extending from Oman's border with the United Arab Emirates near Shinās southeast to As-Sib. The coastal plain varies in width between 10 and 30 miles (15 and 45 km) and is crossed by numerous wadis descending northeastward from the mountain chain of Al-Ḥajar ("The Stone"); the upper courses of the wadis are densely populated. In the parts of the plain removed from the coast and the wadis, acacia trees give way to a barren, pebbly plain near the foothills of Al-Ḥajar. Cultivation is intensive along the length of the coast for the first mile inland because of the ribbon of oases watered by wells and underground channels. Since early times the region has been known for its exports of dates, horses, dried limes, and copper and of ambergris washed up on its shore. It was dominated by the Persians at various times and came under attacks by the Carmathians in the 10th century, the Turks in the 11th-12th century, and the Portuguese in the 16th century.

Al-Bāṭinah has vast plantations of date palms; papaya, lime, and mango trees are grown along the coast in irrigated gardens, which also produce vegetables and some cereal grains. Sheep and goats are raised, and fishing is important. The major towns of Al-Bāṭinah (all on the coast) include Al-Musana'a, As-Suwayq, Al-Khābūrah, As-Ṣaham, Ṣuhār, and Shinās. The inhabitants of the plain (about one-third of Oman's total population) are a mixture of Arabs and Baluchi and are Muslims.

Bāṭīniyah, Muslim sects—the Ismailis (Arabic: *Ismā'īliyah*), in particular—that interpreted religious texts exclusively on the basis of their hidden, or inner, meanings (Arabic: *bāṭin*) rather than their literal meanings (*zāhir*). This type of interpretation gained currency about the 8th century among certain esoteric Shī'ite sects, especially the Ismailis, a religiously and politically schismatic group. The Ismailis believed that beneath every obvious or literal meaning of a sacred text lay a secret, hidden meaning, which could be arrived at through *ta'wīl* (allegorical interpretations); thus, every statement, person, or object could be scrutinized in this manner to reveal its true intent. They further stated that Muḥammad was only the transmitter of the literal word of God, the Qur'ān, but it was the imam (leader) who was empowered to interpret, through *ta'wīl*, its true, hidden meaning.

Speculative philosophy and theology eventually influenced the Bāṭīniyah, though they remained at all times on the side of esoteric knowledge; some Ṣūfis (Muslim mystics) were also placed among the Bāṭīniyah for their insistence that there was an esoteric body of doctrine known only to the initiate. Although the Ismailis had always acknowledged the validity of both *bāṭin* and *zāhir*, about the 12th century this balance was upset by the Nusairis (Nuṣayrīyah) and the Druze, who accepted only the hidden meanings and exalted the imam to extraordinary heights.

Sunnite (traditionalist) Muslim scholars condemned the Bāṭīniyah for all interpretations that rejected the literal meaning and accused

them of producing confusion and controversy through a multiplicity of readings; this, the Sunnites alleged, allowed ignorant or mischievous persons to claim possession of religious truths and thus deceive those who lacked the knowledge to expose them. The Bāṭīniyah were further labeled by the Sunnites as enemies of Islām, bent upon destroying the Sunnites' conception of the faith. *See also* tafsīr.

Batista (y Zaldivar), Fulgencio (b. Jan. 16, 1901, Banes, Cuba—d. Aug. 6, 1973, Marbella, Spain), soldier and dictator who twice ruled Cuba—first in 1933-44, when he gave the nation a strong, efficient government, and again in 1952-59 as a dictator, jailing his opponents, using terrorist methods, and making fortunes for himself and his associates.

The son of impoverished farmers, Batista worked in a variety of jobs until he joined the army in 1921, starting as a stenographer. He rose to the rank of sergeant and developed a large personal following. In September 1933 he organized the "sergeants' revolt"; it toppled the provisional regime of Carlos Manuel de Céspedes, which had replaced the dictatorial regime of Gerardo Machado y Morales. Batista thus became the most powerful man in Cuba.

An astute judge of men, Batista preferred to consolidate his control through patronage rather than terror. He cultivated the support of the army, the civil service, and organized labour. Ruling through associates the first few years, he was elected president in 1940. While greatly enriching himself, he also governed the nation most effectively, expanding the educational system, sponsoring a huge program of public works, and fostering the growth of the economy.

Retiring from office in 1944, he traveled abroad and lived for a while in Florida, where he invested part of the huge sums he had acquired in Cuba. During the eight years that he was out of power in Cuba, there was a resurgence of corruption on a grand scale, as well as a virtual breakdown of public services. His return to power through another army revolt in March 1952 was widely welcomed. But he returned as a brutal dictator, controlling the university, the press, and the Congress, and he embezzled huge sums from the soaring economy. His regime was finally toppled by the rebel forces led by Fidel Castro, who launched their successful attack in the fall of 1958. Faced with the collapse of his regime, Batista fled with his family to the Dominican Republic on Jan. 1, 1959. Later he went into exile on the Portuguese island of Madeira and finally to Estoril, near Lisbon.

Batjan (Indonesia): *see* Bacan.

Battle Berres, Luis (b. Nov. 26, 1897, Montevideo, Uruguay —d. July 15, 1964, Montevideo), Uruguayan journalist who became active in politics and served as president of his country from 1947 to 1951 and chief executive officer in 1953-54.

Nephew of former president José Battle y Ordóñez, Battle Berres was known as a champion of democracy and civil liberties and an outspoken critic of U.S. support of authoritarian Latin-American regimes. He served as a member of the Chamber of Deputies from 1923 to 1933 and from 1942 to 1947 and was president of that body from 1943 to 1945. Elected vice president in 1946, he succeeded to the presidency when the incumbent, Tomás Berreta, died in office. His stable and peaceful administration attracted

large amounts of foreign investment capital. After Uruguay adopted a form of government in which the executive branch consisted of a nine-man council, Batlle was elected head of the council in 1953 and 1954 and remained a member of it until 1959, after his Colorado Party was overwhelmed by the opposition Blanco Party in the November 1958 elections. Batlle founded the newspaper *Acción* in 1948, using it as a vehicle for his political opinions. He also owned the radio station, Ariel.

Batlle y Ordóñez, José (b. May 21, 1856, Montevideo, Uruguay—d. Oct. 20, 1929, Montevideo), statesman who, as president of Uruguay in 1903–07 and 1911–15, is generally credited with transforming his country from an unstable dictatorship into a viable democracy.

Batlle y Ordóñez was the son of General Lorenz Batlle, a president of Uruguay, and a grandson of José Batlle y Carré, a leading citizen of colonial Montevideo. He was educated at the University of Montevideo and at the Sorbonne. He began his political career on June 16, 1886, when he founded the newspaper *El día*. Shortly thereafter he joined the Colorado Party, one of the two ruling political parties of Uruguay, and in 1890 he started work to transform his party into a nationwide democratic political organization. He was elected to the Uruguayan Chamber of Deputies in 1893 and to the Senate for Montevideo in 1896. He soon became president of the Senate and a member of his party's National Executive Commission. In 1900 he made an unsuccessful bid for the national presidency.

Batlle y Ordóñez was elected president in 1903, but by a narrow margin that produced tension with the opposition Blanco Party and led to a civil war in 1904. Batlle y Ordóñez and his followers emerged victorious in 1905, with the Colorado Party in undisputed control of the country. He held honest new presidential and legislative elections in 1905, which he and his party won. At the end of his term in 1907, he freely stepped down from the presidency, though he played a role in choosing his party's presidential candidate.

After a triumphant tour of Europe, Batlle y Ordóñez was reelected president in 1911 and continued the reforms he had started earlier. During his two periods in office, Batlle y Ordóñez inaugurated labour reforms, limited the profits of foreign-owned businesses, encouraged migration, nationalized and developed public works, ended the death penalty, and protected illegitimate children.

At the end of his presidency, fearing the power of a one-man executive, he sought to reform the Uruguayan constitution by creating a collegiate executive. This effort aroused great opposition throughout the country and even divided his own political party. As a result, a new constitution established in 1918 provided for a bifurcated executive—a president and national executive council—which was considered a defeat for Batlle y Ordóñez. Nevertheless, he agreed to serve as president of the council in 1920 and in 1926.

Batlle y Ordóñez

Batman, town, southeastern Turkey, in the centre of the nation's oil-producing region. It is located about 5 miles (8 km) west of the town of Siirt and lies in a region of broad plateaus. A government-owned refinery is located at Batman, and a pipeline extends for nearly 320 miles (515 km) from the oilfields near Batman to the port of Iskenderum on the Mediterranean Sea coast. Batman's industries produce beverages, processed food, chemicals, furniture and fixtures, footwear, machinery, and transport equipment. The town has road and railway links with Diyarbakir and Kurtalan, and it has an airport. Pop. (1985) 110,036.

Batna, city, northeastern Algeria. It lies along the Wadi Tilatou and is situated on a well-watered plain that is bounded on the south by the Aurès Massif and on the north by the Batna Mountains. To the west, the cedar-forested Mount Tougour (Pic des Cèdres) rises to 6,870 feet (2,094 m).

Batna originated in 1844 as a French military outpost that was established to protect el-Kantara Pass between the Atlas Mountains and the Sahara and to patrol the neighbouring mountains. The site was subsequently moved a short distance east to Râs el-Aïoun, where the city was founded in 1848 as Nouvelle Lambèse; it was renamed Batna in 1849. The city's original rectangular plan includes tree-lined avenues, a walled military quarter to the

Batna, Alg., with the Batna Mountains in the background

Dominique Darbois

east, and less orderly recent additions. Batna trades in agricultural and forest products and is a tourist base for the Roman ruins at Tazoult-Lambèse (Lambessa) 7 miles (11 km) to the southeast and Timgad (Thamugadi) 17 miles (27 km) to the east-southeast. Pop. (1987 prelim.) mun., 184,833.

Batoche, unincorporated place, central Saskatchewan, Canada. It lies on the east bank of the South Saskatchewan River, 40 miles (64 km) southwest of Prince Albert. The site was settled in about 1870 by colonists from the Red River Settlement (founded in 1811–12 near the present city of Winnipeg, Man.). The settlement was named for a Métis trader, Xavier Letendre, whose nickname was Batoche. The settlement became the headquarters of Louis Riel, leader of the Métis (half-breeds) in the Riel (North West) Rebellion of 1885, and was the scene of the decisive and bloody battle (May 9–12) in which Canadian militia under General Frederick Middleton defeated the rebels. The battlefield is now contained in Batoche National Historic Park; of special interest are the Métis Cemetery and Rectory (which houses historical exhibits).

Baton Rouge, city, capital of Louisiana, U.S., and seat (1811) of East Baton Rouge parish. Baton Rouge is a port situated at the head of deepwater navigation on the Mississippi River, in the southeast-central part of the state. The French named the town for a red cypress post that marked a boundary between Indian tribes. They built and garrisoned a fort on the site in 1719. The area was ceded to Britain in 1763 at the end of the French and Indian Wars. During the American Revolution, the Spanish

overpowered the British garrison there in the first battle of Baton Rouge (Sept. 21, 1779) and controlled the area for the next 20 years. In 1800 Spain ceded Louisiana to France,

State Capitol, Baton Rouge, La.

Alan Pitcairn from Grant Heilman—EB Inc

and, at the time of the Louisiana Purchase (1803) by the United States, Baton Rouge was claimed by Spain, together with the entire territory of West Florida. The city's inhabitants and the U.S.-born citizens of the surrounding parishes rebelled against Spanish rule in the second battle of Baton Rouge (Sept. 23, 1810) and established the West Florida Republic, which was annexed to the United States three months later. Baton Rouge was incorporated in 1817, and in 1849 it became capital of the state. On March 21, 1861, Louisiana joined the Confederacy; in 1862 Federal forces captured the city in the third battle of Baton Rouge and held it for the remainder of the American Civil War. During the war the seat of state government was transferred to other towns but in 1882 was returned to Baton Rouge.

The old State Capitol (1847–49) was replaced (1931–32) during Governor Huey P. Long's administration; the new building was constructed of marble and other stone brought in from various parts of the world, is 34 stories high, and has an ornate Memorial Hall and observation tower. Its grounds contain a sunken garden with Long's grave.

The city's growth as an industrial centre began with the building of the Standard Oil Company's giant refinery in 1909. Subsequently, many industries were established there, attracted by the proximity of the oil fields (in Texas, Oklahoma, and Louisiana), the economy of ocean and river transportation, and the abundance of natural gas and other natural resources. Dock facilities were expanded, and the Port Allen–Morgan City Cut-Off Canal constructed. Under the impetus of industries established during World War II, the city's population trebled in the decade 1940–50. Baton Rouge is the seat of Louisiana State University and Agricultural and Mechanical College (1860) and Southern University and Agricultural and Mechanical College (1880). Pop. (1990) city, 219,531; Baton Rouge MSA, 528,264.

Batoni, Pompeo Girolamo, Batoni also spelled **BATTONI** (b. Jan. 25, 1708, Lucca, Tuscany [Italy]—d. Feb. 4, 1787, Rome), Italian painter, who in his own time was ranked with Anton Raphael Mengs as a painter of historical subjects. Probably his portraits are now better known, as he invented the type of "grand tourist" portrait, very popular among the English, which shows the sitter at his ease among the ruins of antiquity. Batoni first gained fame as a painter of florid and elaborate mythological allegories. From the 1750s until his death, however, he was the preeminent portraitist in Rome. His smoothly finished

ceremonial portraits of important personages combined elements of the Rococo, Bolognese classicism, and emergent Neoclassicism.

Batoro (people): *see* Toro.

Batory, Stefan (Polish king): *see* Stephen Báthory.

Batrā (ancient Arabia): *see* Petra.

Batrachospermum, genus of freshwater red algae ranging in colour from violet to blue-green. The alga's long, branched, threadlike filaments bear dense whorls of branchlets, the whorls themselves resembling beads on a string. Spores are formed in clusters around the base of the carpogonium (female sex organ) after fertilization. This macroscopic alga, found in streams and in the pools formed in sphagnum bogs, is one of the very few freshwater algae.

Batsányi, János (b. May 9, 1763, Tapolca, Hung.—d. May 12, 1845, Linz, Austria). Hungary's leading political poet during the French Revolutionary and Napoleonic periods in Europe.

Beginning his career as a tutor, Batsányi became the editor of *Magyar Museum* and emerged as an eloquent advocate of social progress and Enlightenment ideals in Hungary. In his political poetry he voiced anti-royalist sentiments and advocated revolution and radical social change. He also wrote lyric poems, among which are many fine elegies. He was an ardent supporter of the French Revolution, an event that inspired his most famous political poem, *A franciaországi változásokra* (1789; "On the Changes in France"). After being imprisoned in Hungary for a year, he moved in 1796 to Vienna, where he married the Austrian poet Gabriella Baumberg. He supported Napoleon and finally settled in Paris, where he was seized by the Austrians after Napoleon's fall. He was thenceforth interned in the Austrian city of Linz for the remaining 30 years of his life and played little further role in Hungarian literature.

Batswana (people): *see* Tswana.

Battak, also spelled **BATTA** (people): *see* Batak.

battalion, a tactical military organization composed basically of a headquarters and two or more companies, batteries, or similar organizations and usually commanded by a field-grade officer. The term has been used in nearly every Western army for centuries and has had a variety of meanings. In the 16th and 17th centuries it denoted a unit of infantry forming part of a line of battle and was loosely applied to any large body of men. During the Napoleonic Wars the French developed an army organization in which the regiment was a unit of administration for its battalions serving as fighting units in the field. In this connection, the terms regiment and battalion often were used interchangeably, but in most modern armies the regiment is a higher unit than the battalion.

In the armies of the Commonwealth nations, infantry battalions, usually commanded by lieutenant colonels, are tactical units formed within regiments, the latter being not tactical but administrative parent organizations. The equivalent tactical artillery and armoured units, however, are called regiments. In most military forces the cavalry equivalent and aviation equivalent of the battalion is the squadron.

In the U.S. Army of the early years of the 20th century, a battalion usually numbered from 500 to 1,000 men and was normally commanded by a lieutenant colonel. After World War I the "square" infantry battalion of four companies was superseded by the "tri-

angular" battalion of World War II and the Korean War, usually composed of three rifle companies, a heavy-weapons company, and a headquarters company. By the late 20th century, the typical U.S. Army battalion was a unit of between 800 and 900 officers and men divided into a headquarters company and three rifle companies. Armoured battalions were organized along similar lines. From two to five battalions formed the combat elements of a tactical brigade, and about 10 battalions formed a division.

In the Soviet army the battalion was smaller than its U.S. counterpart. A typical rifle battalion of a rifle division consisted of 370 officers and men organized into three 78-man rifle companies and machine-gun, artillery, mortar, and service units.

Battambang (Cambodia): *see* Bătdămbâng.

Battāni, al-, in full **ABŪ 'ABD ALLĀH MUḤAMMAD IBN JĀBIR IBN SINĀN AL-BATTĀNĪ AL-ḤARRĀNĪ AS-ṢĀBĪ'**, Latin **ALBATENIUS, ALBATEGNUS, or ALBATEGNI** (b. c. 858, in or near Haran, near Urfa, Syria—d. 929, near Sāmarrā', Iraq), Arab astronomer and mathematician who refined existing values for the length of the year and of the seasons, for the annual precession of the equinoxes, and for the inclination of the ecliptic. He showed that the position of the Sun's apogee, or farthest point from the Earth, is variable and that annular (central but incomplete) eclipses of the Sun are possible. He improved Ptolemy's astronomical calculations by replacing geometrical methods with trigonometry. From 877 he carried out many years of remarkably accurate observations at ar-Raqqah in Syria.

Al-Battānī was the best known of Arab astronomers in Europe during the Middle Ages. His principal written work, a compendium of astronomical tables, was translated into Latin in about 1116 and into Spanish in the 13th century. A printed edition, under the title *De motu stellarum* ("On Stellar Motion"), was published in 1537.

batte din (Judaism): *see* bet din.

battement (French: "beating"), in ballet, an extension of the leg to the front, side, or back, either repeatedly or as a single movement. Among representative types are *battement tendu* ("stretched beating"), in which one leg is extended until the point of the stretched foot barely touches the ground; *grand battement* ("large beating"), in which the leg is lifted to hip level or higher and held straight; *battement frappé* ("struck beating"), in which the ball of the foot brushes the floor as the working foot is briskly extended from a flexed position against the lower calf of the supporting leg; and *petit battement sur le cou-de-pied* ("small beatings on the instep"), in which the working foot touches the front and back of the instep of the supporting leg.

Grand battement, from George Balanchine's *Symphony in C*, performed by the New York City Ballet

Martha Swope

Batten, Jean, byname of **JANE GARDNER BATTEN** (b. 1909, Rotorua, N.Z.—d. Nov. 22, 1982, Majorca, Spain), aviator who made record-breaking flights from 1933 to 1937 and was perhaps the most famous New Zealander of the 1930s.

Batten was sent by her parents to England to study music, but she became intensely interested in flying and earned a private pilot's license in 1930. She gained a commercial pilot's license in 1932. In May 1934 she set a women's record in her solo flight from England to Australia in 14 days, 23 hours, and 25 minutes. In April 1935 she became the first woman to fly solo from Australia to England, and in November 1935 she became the first woman to make a solo flight from England to Argentina. In October 1936 she made the first direct solo flight from England to New Zealand, in the process setting a record time for solo flight from England to Australia. She made other record times in solo flights from Australia to England (October 1937) and from England to Brazil. By the late 1930s she had received many honours and was an international celebrity, but she subsequently stopped flying and became somewhat reclusive. Her autobiography was entitled *My Life* (1938).

Battenberg FAMILY, English **MOUNTBATTEN**, a family that rose to international prominence in the 19th and 20th centuries, the name being a revival of a medieval title.

The first Battenbergs were a family of German counts that died out about 1314 and whose seat was the castle of Kellerburg, near Battenberg, in Hesse. The title was revived in 1851, when Alexander (1823–88), a younger son of Louis II, grand duke of Hesse, contracted a morganatic marriage with the Polish countess Julia Theresa von Hauke (1825–95), who was then created countess of Battenberg. In 1858 the countess and her children were all raised to the rank of prince or princess (*Prinz or Prinzessin*) of Battenberg.

In 1917 the eldest son of this union, Louis Alexander (1854–1921), who had become an admiral in the British navy, was created marquis of Milford Haven (*see* Milford Haven, Louis Alexander, 1st Marquess of); and, at the request of King George V, the members of the family who lived in England renounced, in 1917, the German title of prince of Battenberg and adopted the English form of Mountbatten as a surname.

Milford Haven was the father of Princess Alice (1885–1969), who married Prince Andrew of Greece (1882–1944); their only son, Prince Philip (1921–), took the surname Mountbatten and was created duke of Edinburgh when he became a British subject in 1947 and married Princess Elizabeth, who became Queen Elizabeth II in 1952. Milford Haven's younger daughter, Louise (1889–1965), became in 1923 the second wife of Crown Prince Gustav Adolf, who in 1950 became King Gustav VI Adolf of Sweden. The youngest of Milford Haven's two sons, Louis, was the prominent British military leader and statesman Louis Mountbatten, 1st Earl Mountbatten of Burma. Milford Haven had three younger brothers. Alexander (1857–93) was ruling prince of Bulgaria from 1879 to 1886. Henry Maurice (1858–96) took British nationality on his marriage in 1885 to Queen Victoria's youngest daughter, Princess Beatrice, and was the father of Victoria Eugenie, or Ena (1887–1969), who in 1906 married King Alfonso XIII of Spain. Francis Joseph (1861–1924) married in 1897 Anna, daughter of Nicholas I, prince of Montenegro.

Battenberg, Louis Alexander, prince of: *see* Milford Haven, Louis Alexander Mountbatten, 1st Marquess of.

Battenberg, Louis Francis Albert Victor Nicholas, prince of: *see* Mountbatten (of Burma), Louis Mountbatten, 1st Earl.

batter, mixture of flour and liquid with other ingredients, such as leavening agents, shortening, sugar, salt, eggs, and various flavouring materials, used to make baked products.

Such mixtures—called doughs—are thick and flexible, allowing them to be shaped and rolled. Batters, however, contain higher proportions of liquids, are thinner than doughs, and can be stirred, poured, and dropped from a spoon. Batter products are mainly shaped by the form of the containers in which they are baked and include biscuits, muffins, scones, corn bread, pancakes, layer cakes, and angel food cakes. Angel food and sponge-cake batters, usually made without leavening ingredients, are leavened during baking by the expansion of the many small air bubbles incorporated in the batter by vigorous mixing or beating. Batters are also used as coatings for foods that are to be sautéed or fried.

battering ram, medieval weapon consisting of a heavy timber with a metal knob or point at the front. Such devices were used to batter down the gates or walls of a besieged city or castle. The ram itself, usually suspended by ropes from the roof of a movable shed, was swung back and forth by its operators against the besieged structure. The roof of the shed was usually covered with animal skins to protect the weapon's operators from bombardment with stones or fiery materials.

Battersea, area of Greater London, on the south bank of the River Thames, in the borough of Wandsworth. The riverside of the area is lined with factories and is dominated by an electric power station, a well-known London landmark. Battersea Park (200 ac [80 ha]), bordering the river between Albert and Chelsea bridges, was laid out (1858) as a municipal park and adapted as pleasure gardens with rides and other amusement devices for the Festival of Britain (1951). The home (founded 1860) on Battersea Park Road for stray and unwanted dogs and cats is also well known.

Battersea enamelware, type of painted enamelware considered the finest of its kind to be produced in England during the mid-18th century. It is especially noted for the high quality of its transfer printing. Battersea ware was made at York House in Battersea, a district in London, by Stephen Theodore Janssen between 1753 and 1756. This ware is variably composed of soft white enamel completely covering a copper ground. A design is applied to the white enamel either by painting by hand or by transfer printing, a process by which an impression from an engraved metal plate brushed with enamel colours is transferred to paper and then to the surface to be decorated. Transfer printing was used on a large scale for

the first time at Battersea. Most of the articles produced there, small ornamental pieces such as snuffboxes and watchcases, were decorated in the Rococo style with mottoes, portraits, landscapes, or flowers. The shapes of the objects and the decorative motifs are often imitative of Meissen porcelain ware.

battery (law): *see* assault and battery.

battery, in electricity and electrochemistry, any of a class of devices that convert chemical energy directly into electrical energy. Although the term battery, in strict usage, designates an assembly of two or more voltaic cells capable of such energy conversion, it is commonly applied to a single cell of this kind.

A brief treatment of batteries follows. For full treatment, *see* MACROPAEDIA: Energy Conversion.

The mechanism by which a battery generates an electric current involves the arrangement of constituent chemicals in such a manner that electrons are released from one part of the battery and made to flow through an external circuit to another part. The part of the battery at which the electrons are released to the circuit is called the anode, or the negative electrode; the part that receives the electrons from the circuit is known as the cathode, or the positive electrode. (In a device that consumes current—*e.g.*, electroplating cell, electron tube, etc.—the term anode is often applied to the positive electrode, while the negative electrode is called the cathode.)

The first battery appears to have been constructed about 1800 by Alessandro Volta, a professor of natural philosophy at the University of Pavia in Italy. This device, later known as the voltaic pile, was composed of a series of silver and zinc disks in pairs, each of which was separated with a sheet of pasteboard saturated in salt water. A current was produced when the uppermost disk of silver was connected by a wire to the bottom disk of zinc. In 1836 the English chemist John Daniell developed what is considered the classic form of the voltaic cell.

A voltaic cell is composed of two chemicals with different electron-attracting capabilities that are immersed in an electrolyte and connected to each other through an external circuit. These two chemicals are called an electrochemical couple. In a zinc-acid cell, for example, the electrochemical couple is a zinc-hydrogen ion couple. The reaction that occurs between an electrochemical couple in a voltaic cell is an oxidation-reduction reaction.

At rest, a voltaic cell exhibits a potential difference (voltage) between its two electrodes that is determined by the amount of chemical energy available when an electron is transferred from one electrode to the other and is thus subject to the chemical nature of the materials used in the electrode. The current that flows from a cell is determined by the resistance of the total circuit, including that of the cell itself. A low-resistance cell is required if extremely large currents are desired. This can be achieved by the utilization of electrodes with large areas. In short, the maximum current that can be drawn from a cell is dependent on the area of the electrodes. Whenever a current flows, the voltage of a cell decreases because of internal resistance of the cell and the slowness of the chemical process at the electrodes.

A voltaic cell has a limited energy content, or capacity, which is generally given in ampere-hours and determined by the quantity of electrons that can be released at the anode and accepted at the cathode. When all of the chemical energy of the cell has been consumed—usually because one of the electrodes has been completely exhausted—the voltage falls to zero and will not recover. The capacity of the cell is determined by the quantity of active ingredients in the electrode.

There are two major types of voltaic cells:

primary batteries and secondary, or storage, batteries. (The latter are sometimes also called accumulators.) Primary cells are constructed in such a way that only one continuous or intermittent discharge can be obtained. Secondary devices, on the other hand, are constructed so that they can be discharged and then recharged to approximately their original state. The charging process is the reverse of the discharge process; therefore, the electrode reactions in these batteries must be reversible.

Primary batteries. Several varieties of primary cells are available. These include dry, wet, and solid electrolyte.

Dry cells are not actually dry but contain an aqueous electrolyte that is unspillable or immobilized. Many of these cells are sealed to prevent seepage of the electrolyte or reaction products. Common examples of such primary batteries are acidic dry cells (*e.g.*, carbon-zinc cells), used in flashlights, toys, and certain transistorized portable radios; alkaline dry cells, employed in cameras, tape recorders, and electric razors; and mercury cells, utilized in hearing aids and photographic flash guns.

Wet cells contain a free and mobile electrolyte. They are used when service requirements include large capacity and moderately high currents, as, for example, in telephone and telegraph circuits and in signal systems for marine, mine, highway, and railway use. The Lalande cell of zinc-copper oxide-sodium hydroxide and the zinc-air-sodium hydroxide cell have been widely employed for such applications. Often included among wet primary cells is the so-called reserve battery, in which either magnesium-silver chloride or magnesium-cuprous chloride serves as the electrode material. Because these compounds are readily attacked by electrolytes (either seawater or liquid ammonia), the battery is assembled with the electrolyte stored in a separate container. The electrolyte is added immediately before use. The reserve battery has been utilized primarily for military applications.

Solid electrolyte cells contain electrolytes of crystalline salts such as silver iodide or lead chloride that have predominantly ionic conductivity. They are suitable for long-term operations that require very low drain or for stand-by services. Miniature versions of solid salt electrolyte batteries have been developed for use in various kinds of electronic devices.

Secondary batteries. Such batteries consist of an assemblage of several identical voltaic cells. Of the various types of storage batteries available, the lead-acid type is the most widely used. It serves as the power source for the electrical systems of many kinds of motor vehicles, particularly automobiles and trucks. It is also commonly used to provide electricity for emergency lighting and communication circuits. The active constituents of a lead-acid battery are sulfuric acid and two sets of plates (electrodes)—one containing pure lead and the other lead dioxide. Each component cell consists of several of these plate pairs connected in parallel and is capable of delivering approximately two volts. Three or six cells are connected in series to make a 6- or 12-volt battery, respectively. The sulfuric-acid electrolyte in each of the cells is stored separately in its own compartment. During discharge, the plate materials are converted into lead sulfate and the sulfuric acid is depleted. Discharge stops before all component chemicals are exhausted, usually when the acid can no longer reach the active materials. Charging the battery by passing a direct current through it reverses the chemical changes, displacing the sulfate from the plates and causing a rise in the specific gravity of the sulfuric acid.

Another important type of storage battery is the nickel-cadmium battery, which operates much like the lead-acid variety but with dif-

Battersea enamelware plaque, 1750-56; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London photograph A.C. Cooper Ltd

ferent chemical ingredients. It consists of a nickel hydroxide cathode and a cadmium anode immersed in an electrolyte of potassium hydroxide solution. The nickel-cadmium battery is lighter in weight than are other storage batteries and can be hermetically sealed. Because of these features, nickel-cadmium cells are utilized in many kinds of cordless appliances and other portable equipment.

A third storage battery of significance is the silver-zinc type. The anode of this device is composed of a porous plate of zinc, the cathode of a silver screen pasted with silver oxide, and the electrolyte of a solution of potassium hydroxide saturated with zinc hydroxide. Silver-zinc batteries can be charged and discharged only a limited number of times because of the structure used to separate the electrodes. They do have, however, a high energy-to-weight ratio and are suitable for applications in which light weight is important.

Batthyány, Lajos, Count (Gróf) (b. Feb. 14, 1806, Pozsony, Hung., Austrian Empire [now in Bratislava, Slvk.]—d. Oct. 6, 1849, Pest [now in Budapest], Hung.), statesman who during the revolution of 1848 was premier of the first Hungarian parliamentary government and a martyr for Magyar independence.

The son of wealthy liberal landowners whose nobility dated to 1398, Batthyány entered the military but left it in 1827 to manage his estates and to take a law degree at the University of Zagreb. Travel in western Europe acquainted him with advanced liberal ideas and capitalist business practices, which he applied successfully to his own economic interests.

He became a member of Hungary's upper house in 1830, and in 1845 he led the forces seeking Hungarian independence from the Habsburg monarchy. Meanwhile, he continued his business activity and in 1843 headed the sugar industry trust. He went to Vienna in March 1848 as a member of the committee that presented Hungarian demands for parliamentary reform to the Austrian imperial court. The following month the Austrian emperor Ferdinand I (King Ferdinand V of Hungary) appointed Batthyány prime minister of Hungary's new parliamentary government, which took office on April 7. Despite his able leadership and the passing of important social legislation, his government was caught between the forces of the Austrian monarchy and the extreme separatist Hungarian elements.

In the ensuing civil war, Batthyány tried to mediate but finally took the side of the revolutionaries. On October 11 he was wounded in battle, fell from his horse, and broke an arm. In attempting to negotiate with the Austrian forces, he was captured on Jan. 3, 1849, and sentenced to death by hanging. The night before the execution Batthyány tried, unsuccessfully, to kill himself with a knife. The next morning, badly wounded, he was shot for the crime of sedition. His death caused deep mourning across the nation and aligned European public opinion against Austria.

Batticaloa, town, eastern Sri Lanka. Lying on an island off the eastern coast, it is linked to the mainland by causeway, bridge, and ferry and by road and railway connections. Batticaloa is the trading centre for rice and coconuts from nearby plantations and for other agricultural products. It was captured by the Portuguese in 1622, by the Dutch in 1638, and by the British in 1796. The region has been a centre of Tamil separatist activity, and during the 1980s the town was held by Tamil rebels until it was retaken in 1991 by government troops. Batticaloa was struck in 2004 by a large tsunami, which caused widespread death and destruction. Ruined Portuguese and Dutch forts remain from the colonial period. Pop. (2001 prelim.) 78,480.

Battishill, Jonathan (b. May 1738, London, Eng.—d. Dec. 10, 1801, Islington, London), English composer of church music and popular songs.

Battishill was a chorister at St. Paul's Cathedral (1747) and later a harpsichordist at Covent Garden. He composed songs and choruses for plays, notably, *Almena* (1764), an opera produced at Drury Lane as the work of Battishill and Michael Arne. In 1764 he became organist at St. Clement Danes and St. Martin-in-the-Fields and wrote psalm settings and hymns, catches, glees, and madrigals. He ceased composing after his wife's elopement in 1777, devoting himself to his book collection.

Battle, town (parish), Rother district, county of East Sussex, Eng., just inland from Hastings. A ridge to the southeast, called Senlac, was the site of the famous battle in which William I the Conqueror defeated the English in 1066. Before the battle William vowed to build an abbey on the spot if victorious, and in 1094 its church was consecrated, with an altar standing where the English king Harold II fell. The great gateway, built in 1338, survives alongside the town, but after the Reformation the church was destroyed and the abbey converted into a mansion that is now occupied by a school. Pop. (2001) 6,048.

Battle Creek, city, Calhoun county, south-central Michigan, U.S. It lies at the juncture of Battle Creek with the Kalamazoo River, 23

Kellogg's Cereal City USA, Battle Creek, Mich., a cereal-themed attraction
Kellogg's Cereal City USA

miles (37 km) east of Kalamazoo. Settled in 1831 and named in 1834 for a "battle" that had taken place on the riverbank between two Indians and two members of a surveying party, it became a flour and woolen mill centre and the headquarters of the Seventh-day Adventist denomination. In 1866 the Adventists founded the Western Health Reform Institute (renamed Battle Creek Sanitarium, 1878); the main building was a U.S. Army hospital in 1943–54. Under the direction (1876–1943) of Dr. John Harvey Kellogg, the sanitarium experimented with health foods, leading to the manufacture of ready-to-eat cereals, which became the city's main industry.

The Cereal Festival is an annual (June) event. In addition to the cereal plants, manufactures include auto parts, packaging machinery, and metal and paper products. The federal government opened an administrative centre in the former army hospital in 1954. The W.K. Kellogg Foundation was established in the city (1930) to improve the well-being of children. The city is the site of Kellogg Community College (1956) and the Leila Arboretum and Kingman Museum of Natural History. The Kellogg Biological Station (a bird sanctuary and agricultural research laboratory) of Michigan State University is 12 miles (19 km) northwest. Sojourner Truth, the black civil-rights pioneer, who lived and is buried in Battle Creek, is memorialized by a number of monuments in the city. Inc. village, 1850; city, 1859. Pop. (2004 est.) city, 53,399; Battle Creek MSA, 139,067.

battle fatigue: *see* combat fatigue.

Battle of ——— : *see under* substantive word (e.g., Waterloo, Battle of), except as below.

Battle of Brunanburh, The, Old English poem of 74 lines included in the Anglo-Saxon Chronicle under the year 937. It relates the victory of the Saxon king Athelstan over the allied Norse, Scots, and Strathclyde Briton invaders under the leadership of Olaf Guthfrithson, king of Dublin and claimant to the throne of York. The poem is basically the victors' bitter taunt of the defeated. It counts the dead kings and earls on the battlefield and pictures the Norsemen slinking back to Dublin in their ships while their dead sons are being devoured by ravens and wolves. The poem claims that this was the greatest battle ever fought in England.

Battle of Maldon, The, Old English heroic poem describing a historical skirmish between East Saxons and Viking (mainly Norwegian) raiders in 991. It is incomplete, its beginning and ending both lost. The poem is remarkable for its vivid, dramatic combat scenes and for its expression of the Germanic ethos of loyalty to a leader. The poem, as it survives, opens with the war parties aligned on either side of a stream (the present River Blackwater near Maldon, Essex). The Vikings offer the cynical suggestion that the English may buy their peace with golden rings. The English commander Earl Byrhtnoth replies that they will pay their tribute in spears and darts. When the Vikings cannot advance because of their poor position, Byrhtnoth recklessly allows them safe conduct across the stream, and the battle follows. In spite of Byrhtnoth's supreme feats of courage, he is finally slain. In panic some of the English warriors desert. The names of the deserters are carefully recorded in the poem along with the names and genealogies of the loyal retainers who stand fast to avenge Byrhtnoth's death. The 325-line fragment ends with the rallying speech of the old warrior Byrhtwold (here in modern English):

Mind must be firmer, heart the more fierce,
Courage the greater, as our strength
diminishes . . .

battledore and shuttlecock, children's game played by two persons using small rackets called battledores, which are made of parchment, plastic, or rows of gut or nylon stretched across wooden frames, and shuttlecocks, made of a base of some light material, such as cork, with trimmed feathers fixed around the top. Players try to bat the shuttlecock back and forth as many times as possible without allowing it to fall to the ground. Ancient Greek drawings represent a game almost identical with battledore and shuttlecock, and it has been popular in China, Japan, India, and Thailand for at least 2,000 years. It has been played in Europe for centuries. Badminton is a further development of the game.

Battleford, town, western Saskatchewan, Can. It lies at the confluence of the Battle and North Saskatchewan rivers, opposite North Battleford. Established in 1876 as Fort Battleford, an outpost of the North West Mounted Police, the settlement served as capital of the Northwest Territories until 1883. Battleford was partially burned in 1885 by the Cree, who were spurred on by the Riel (North West) Rebellion. The town was resettled but after repeated flooding was moved to the north bank of the Battle River. When the railway bypassed it in 1903, a new settlement (North Battleford) was established on the north bank of the North Saskatchewan River. Fort Battleford National Historic Park contains buildings of the original fort. Inc. village, 1899; town, 1910. Pop. (2001) 3,820.

battlement, the parapet of a wall consisting of alternating low portions known as crenels, or crenelles (hence crenellated walls with battlements), and high portions called merlons.

Battlements were devised in order that warriors might be protected by the merlons and yet be able to discharge arrows or other missiles through the crenels. The battlement was an early development in military architecture; it was found in Chaldea, Egypt, and prehistoric Greece, as well as commonly in ancient Roman fortifications. It was in the European Middle Ages that the battlement received its highest development, crenels being narrowed and frequently given splayed sides, the merlons often having in the centre a thin slit, sometimes cross-shaped, to give the widest possible arc for the discharge of missiles. The developed medieval battlement was frequently bracketed out from the face of the wall, and holes in its floor were provided to allow objects to be dropped directly upon attacking forces.

In actual siege use, the battlement was usually covered with a protecting shed of timber and hides. In some countries, through Middle Eastern influence, the battlement frequently took decorative shapes; and toward the end of the Gothic period in Europe, as the military necessity decreased, the battlement became merely decorative.

battleship, capital ship of the world's navies from about 1860, when it began to supplant the wooden-hulled, sail-driven ship of the line, to World War II, when its preeminent position was taken over by the aircraft carrier. Battleships combined large size, powerful guns, heavy armour, and underwater protection with fairly high speed, great cruising radius, and general seaworthiness. In their ultimate development they were able to hit targets with great precision at a range of more than 20 miles (30 km) and to absorb heavy damage while remaining afloat and continuing to fight.

The battleship type had its genesis in the *Gloire*, a French oceangoing ironclad displacing 5,600 tons that was launched in 1859. (The *Gloire* and similar ships of combined sail and steam propulsion were given various names such as armoured frigate or steam frigate; the term battleship did not become current until some years later.) In 1869 HMS *Monarch* became the first oceangoing iron-hulled battleship. In place of broadside guns fired through portholes in the hull, this vessel mounted four 12-inch guns in two revolving turrets on the main deck. Over the following decades, battleships dispensed with auxiliary sail power. They adopted a mixed armament of large-calibre turret guns of 10 to 12 inches for long-range battle with other capital ships, medium guns of 6 to 8 inches for close range, and small guns of 2 to 4 inches for beating back torpedo boats.

USS *Alabama*, navy battleship of World War II

By courtesy of the U.S. Navy

In 1906 HMS *Dreadnought* revolutionized battleship design by introducing steam-turbine propulsion and an "all-big-gun" armament of 10 12-inch guns. Thereafter, capital ships were built without medium guns. Speeds of more than 20 knots were attained, and, as guns grew

to 16 and 18 inches, fleets of "superdreadnoughts," displacing 20,000 to 40,000 tons, took to the seas.

The Washington Treaty of 1922 limited new battleships to 35,000 tons. Ships built to this standard were of a new "fast battleship" generation, which combined the heavy armament and armour of dreadnought battleships with the speeds (exceeding 30 knots) of lightly armoured cruisers.

Shortly before World War II the Washington Treaty was abandoned. Displacement rose once more, with Germany building two ships of the Bismarck class of 52,600 tons, the United States four of the Iowa class of 45,000 tons, and Japan two of the Yamato class, which set the all-time record at 72,000 tons. Battleships now bristled with antiaircraft armament, consisting of rapid-fire guns of about 5 inches calibre and dozens of automatic weapons of 20 to 40 mm.

In World War II the extended striking range and power of naval aircraft effectively ended the dominance of the battleship. Battleships served mainly to bombard enemy coastal defenses in preparation for amphibious assault and as part of the air-defense screen protecting carrier task forces.

Construction of battleships stopped with those begun during World War II. In the following decades most of the battleships of the major powers were scrapped, "mothballed" (stripped down and placed in storage), or sold to lesser navies. During the Korean War the United States used its Iowa-class ships for shore bombardment.

By the 1980s only the United States had battleships. These were recommissioned and equipped with cruise missiles. Following service in 1991 during the Persian Gulf War, the last two active ships, the *Wisconsin* and the *Missouri*, were decommissioned.

Battoni, Pompeo Girolamo (Italian painter): see Batoni, Pompeo Girolamo.

Batu (d. c. 1255, Russia), grandson of Genghis Khan and founder of the Khanate of Kipchak, or the Golden Horde.

In 1235 Batu was elected commander in chief of the western part of the Mongol empire and was given responsibility for the invasion of Europe. By 1240 he had conquered all of Russia. In the campaign in central Europe, one Mongol army defeated Henry II, Duke of Silesia (now in Poland), on April 9, 1241; another army led by Batu himself defeated the Hungarians two days later.

With Poland, Bohemia, Hungary, and the Danube valley under his control, Batu was poised for the invasion of western Europe when he received news of the death of the head of the Mongol empire, the great khan Ögödei (December 1241). In order to participate in the choice of a successor, Batu withdrew his army, saving Europe from probable devastation. He established the state of the Golden Horde in southern Russia, which was ruled by his successors for the next 200 years. In 1240 Batu's army sacked and burned Kiev, then the major city in Russia. Under the Golden Horde, the centre of Russian national life gradually moved from Kiev to Moscow.

Batu Islands, Indonesian KEPULAUAN BATU, Dutch BATOE EILANDEN, group of three major islands and 48 islets, part of the Nias *kabupaten* (regency) of Sumatera Utara *provinsi* ("province"), Indonesia, west of Sumatra. The three largest islands are Pini, Tanahmasa, and Tanahbala; the total area is 6,370 square miles (16,500 square km). The administrative centre is Pulautele on Sibua Island. The islands are generally low and forested, notably with coconut palm; copra and forest products predominate. The inhabitants are of Malay or Proto-Malay stock, akin to those of Nias Island. Only about 20 of the smaller islands are inhabited. Pop. (latest est.) 10,488.

Batumi, city and capital of Ajaria (Adzhariya), Georgia, on a gulf of the Black Sea about 9.5 miles (15 km) north of the Turkish frontier. The city's name comes from the location of its first settlement, on the left bank of the Bat River. With a history dating from the first millennium BC, Batumi was ceded by Turkey to Russia in 1878. It is an important port. There is an oil refinery using petroleum piped from

Tea plantation outside Batumi, Ajaria, Georgia

Se-Hedin Bild

Baku. Other industries include a shipyard, machine-building, zinc-plating, and furniture factories, as well as a range of light industries. Although industrially developed, Batumi is an attractive city and popular resort. Its many gardens and its streets are lined with exotic plants; north of the city is the Batumi Botanical Garden, with a rich collection of subtropical and tropical plants. Batumi is the centre of a tea- and citrus-growing area; there are tea plantations on the city's outskirts. There are teacher-training and polytechnic institutes. Pop. (1997 est.) 137,100.

Batusi (people): see Tutsi.

Batwa (people): see Twa.

Baty, Gaston, in full JEAN-BAPTISTE-MARIE-GASTON BATY (b. May 26, 1885, Pélussin, Loire, France—d. Oct. 13, 1952, Pélussin), French playwright and producer who exerted a notable influence on world theatre during the 1920s and '30s.

Baty was influenced by both German and Russian theatre, particularly the work of Munich designer Fritz Erler, and favoured a nonnaturalistic approach to staging to abolish barriers between performers and audience. In 1922 he helped found the *Compagnons de la Chimère* and, in the following year, its workshop, *La Baraque de la Chimère*. Upon its closing he worked at various theatres, including the Odéon and the Studio de Champs-Élysées in Paris.

In 1930 Baty settled permanently at the Théâtre Montparnasse in Paris, where he presented his greatest productions, of which *Crime and Punishment* was perhaps the best. Possessing a superb pictorial sense for beautiful groupings and movement, he directed the delicate plays of Jean-Jacque Bernard, notably *Martine*, with admirable subtlety. He brought to the stage such unconventional plays as Jean Sarmant's *Facilité*, August Strindberg's *The Dance of Death*, and Simon Gantillon's *Cyclone*. He also produced the works of William Shakespeare, Johann Wolfgang von Goethe, George Bernard Shaw, and Eugene O'Neill. Among Baty's own plays, the adaptation of Gustave Flaubert's *Madame Bovary* (1936) and *Dulcinée* (1938), drawn from Miguel de Cervante's *Don Quixote*, are particularly noteworthy. He was appointed one of the

producers at the Comédie-Française in 1936. Baiy was sometimes criticized for sacrificing the texts of plays for scenic effect, but his mastery of those effects was widely acknowledged.

Batyushkov, Konstantin Nikolayevich, Batyushkov also spelled BATIUSHKOV (b. May 18 [May 29, New Style], 1787, Vologda, Russia—d. July 7 [July 19], 1855, Vologda), Russian elegiac poet whose sensual and melodious verses were said to have influenced the great Russian poet Aleksandr Pushkin.

Batyushkov's early childhood was spent in the country on his father's estate. When he was 10 he went to Moscow, where he studied the classics and learned French and Italian, languages that were to have an important influence on his style of writing. In 1802 he went to St. Petersburg, living for a time with an uncle, Mikhail Muravyov, a writer and poet. He served in the army during the campaigns of 1813–14 against Napoleon. Afterward, he became a prominent member of Arzamas (a literary group formed by the followers of Nikolay Karamzin, who advocated the modernization of the Russian literary language).

Batyushkov's literary output was not large—a few elegies and lyrics and some free translations of amorous epigrams from the Greek—but his verses are unique in their Italianate quality, producing a musical softness and sweetness. His poetry, written between 1809 and 1812, brought him fame. His collected works appeared in 1817, and shortly afterward he ceased writing. Suffering from mental illness, he was sent abroad in hope of a cure, which was never achieved.

Batz, Jean, baron de (b. Dec. 26, 1760, Goutz, France—d. Jan. 10, 1822, Chadieu), royalist conspirator during the French Revolution.

Born of a noble family in Gascony, Batz entered the army at the age of 14, rising to the rank of colonel by 1787. During Louis XVI's reign he busied himself with financial transactions and made a fortune. He was sent to the Estates-General of 1789, and from then until 1793 he was a member of each of the successive national revolutionary assemblies and served on the Committee on Finances. Emigrating briefly in 1792, he returned to France to work against the Revolution. He laid an unsuccessful plot to save Louis on his way to the guillotine in January 1793, did much to organize the riots against the Convention in March, and tried to rescue Marie Antoinette from prison in June.

Meanwhile, he and a cosmopolitan clique of financiers were doing their best, by dubious operations, to discredit the Republic and to raise funds for the royalists. A number of deputies in the Convention were implicated with them in a fraudulent scheme to make money on the shares of the French India Company. After Batz's schemes were discovered late in 1793, the Convention offered a reward for him dead or alive and executed 55 of his associates (June 1794). Arrested for participating in the uprising of 13 Vendémiaire (October 1795), Batz somehow managed to win his freedom. Thenceforth he lived in obscurity at his estate at Chadieu. He was honoured with a knighthood for his "heroism" after the Restoration of the Bourbon monarchy in 1815.

Bau (Sumerian), also called NININSINA, Akkadian GULA, or NINKARRAK, in Mesopotamian religion, city goddess of Urukug in the Lagash region and, under the name Nininsina, the Queen of Isin, city goddess of Isin, south of Nippur.

Bau seems originally to have been goddess of the dog; as Nininsina she was long represented with a dog's head, and the dog was her emblem. Perhaps because the licking of sores

by dogs was supposed to have curative value, she became a goddess of healing. She was a daughter of An, king of the gods, and the wife of Pabilsag, a rain god who was also called Ninurta, or Ningirsu.

Bauchi, state, northeastern Nigeria. Before 1976 it was a province in former North-Eastern state. Bauchi is bounded by the states of Kano on the northwest; Kaduna on the west; Plateau, Taraba, and Adamawa on the south; and Borno and Yobe on the east. The highlands in the southwestern part of the state are an extension of the Jos Plateau. The Gongola River, rising in the Jos Plateau, flows to the northeast, then turns southward (loosely tracing the southern half of the state's eastern boundary) to merge with the Benue River in Adamawa state. Bauchi state is inhabited by a large number of ethnic groups, including the Tangale, Waja (Wajawa), Fulani, and Hausa. The state also contains a number of traditional Muslim emirates.

Agriculture dominates the economy, and millet, sorghum, corn (maize), yams, rice, cassava, tomatoes, and vegetables are produced. Bauchi is one of the country's main cotton-producing states; coffee and peanuts (groundnuts) are the other cash crops. Cattle, goats, and sheep are raised. Alluvial tin and columbite mining provide minerals for export; cassiterite, coal, limestone, iron ore, antimony, and marble are abundant mineral resources. Cotton weaving and dyeing, tanning, and blacksmithing are traditional activities. The state's industries include meat-products processing and canning, peanut processing, vegetable-oil milling, and cotton ginning. There is also an assembly plant for commercial vehicles and trucks and a cement factory. Bauchi town, the state capital, is an important collecting and shipping centre on the railway from Maiduguri to Kafanchan and is also a major road hub in the state. Yankari National Park (*q.v.*), with a hot spring at Wikki, is a major tourist attraction. Area 24,944 square miles (64,605 square km). Pop. (1991 prelim.) 4,294,413.

Bauchi, town, capital of Bauchi state and traditional emirate, northeastern Nigeria. Bauchi town lies on the railroad from Maiduguri to Kafanchan. The emirate was founded (1800–10) by Yakubu, one of Sheikh Usman dan Fodio's commanders. Yakubu conquered a sparsely wooded savanna region (the Bauchi High Plains) mainly inhabited by non-Muslim peoples. After successful campaigns he founded (1809) the town of Bauchi. Yakubu built the town's walls, the circumference of which measures 6.5 miles (10.5 km).

Emir Usman moved the capital to Rauta (35 miles northwest) in 1877; but Bauchi once again became the emirate headquarters when, in 1902, the British occupied the town and deposed Emir Umaru. In 1926 it became the headquarters of Bauchi province, and in 1976 capital of the newly created Bauchi state.

With the coming of the railway in 1961, Bauchi grew as a collecting point for peanuts (groundnuts) and cotton and a trade centre in sorghum, millet, cowpeas, corn (maize), cassava, and vegetables and in cattle, goats, and sheep. Cotton weaving and dyeing, tanning, and blacksmithing are traditional activities. The town's industry includes an asbestos factory, a meat-products processing plant and cannery, and one of the first Nigerian assembly plants for commercial vehicles and trucks. Abubakar Tafawa Balewa University (1988) and a federal polytechnic college are in the town. Pop. (1991 est.) town, 76,070.

Baudelaire, Charles, in full CHARLES-PIERRE BAUDELAIRE (b. April 9, 1821, Paris, France—d. Aug. 31, 1867, Paris), French poet, transla-

tor, and literary and art critic whose reputation rests primarily on *Les Fleurs du mal* (1857; *The Flowers of Evil*), which was perhaps the most important and influential poetry collection published in Europe in the 19th century. Similarly, his *Petits poèmes en prose* (1868; "Little Prose Poems") was the most successful and innovative early experiment in prose poetry of the time.

Early life. Baudelaire was the only child of François Baudelaire and his much younger second wife, Caroline Defayis, whom he married in 1819. Having begun his career as a priest, François had abandoned holy orders in 1793 and ultimately became a prosperous middle-ranking civil servant. A painter and poet of modest talent, he introduced his son to art, or what the younger Baudelaire would later call his greatest, most consuming and

Baudelaire, photograph by Étienne Carjat, 1863

earliest of passions, "the cult of images." His father died in February 1827, and for some 18 months thereafter Baudelaire and his mother lived together on the outskirts of Paris in conditions that he would always remember, writing to her in 1861 of that "period of passionate love" for her when "I was forever alive in you; you were solely and completely mine." This "verdant paradise of childhood loves" abruptly ended in November 1828 when Caroline married Jacques Aupick, a career soldier who rose to the rank of general and who later served as French ambassador to the Ottoman Empire and Spain before becoming a senator under the Second Empire.

In 1831 Aupick was posted to Lyons, and Baudelaire began his education at the Collège Royal there in 1832 before transferring, on the family's return to Paris in 1836, to the prestigious Lycée Louis-le-Grand. Baudelaire showed promise as a student and began to write his earliest poems, but to his masters he seemed an example of precocious depravity, adopting what they called "affectations unsuited to his age." He also developed a tendency to moods of intense melancholy, and he became aware that he was solitary by nature. Regular acts of indiscipline led to his being expelled from the school after a trivial incident in April 1839. After passing his *baccalauréat* examinations while enrolled at the Collège Saint-Louis, Baudelaire became a nominal student of law at the École de Droit while in reality leading a "free life" in the Latin Quarter. There he made his first contacts in the literary world and also contracted the venereal disease that would eventually kill him, probably from a Jewish prostitute nicknamed Sarah la Louchette ("Squint-eyed Sarah"), whom he celebrated in some of his most affecting early poems.

In an attempt to wean his stepson from such disreputable company, Aupick sent him on a protracted voyage to India in June 1841, but Baudelaire effectively jumped ship in Mauritius and, after a few weeks there and in Ré-

union, returned to France in February 1842. The voyage had deepened and enriched his imagination, however, and his brief encounter with the tropics would endow his writing with an abundance of exotic images and sensations and an everlasting theme of nostalgic reverie.

Baudelaire came into his inheritance in April 1842 and rapidly proceeded to dissipate it on the lifestyle of a dandified man of letters, spending freely on clothes, books, paintings, expensive food and wines, and, not least, hashish and opium, which he first experimented with in his Paris apartment at the Hôtel Pimodan (now the Hôtel Lauzun) on the Île Saint-Louis between 1843 and 1845. It was shortly after returning from the South Seas that Baudelaire met the mulatto woman known as Jeanne Duval, who, first as his mistress and then, after the mid-1850s, as his financial charge, was to dominate his life for the next 20 years. Jeanne would inspire Baudelaire's most anguished and sensual love poetry, her perfume and, above all, her magnificent flowing black hair provoking such masterpieces of the exotic-erotic imagination as "La Chevelure" ("The Head of Hair").

Baudelaire's continuing extravagance exhausted half his fortune in two years, and he also fell prey to cheats and moneylenders, thus laying the foundation for an accumulation of debt that would cripple him for the rest of his life. In September 1844 his family imposed on him a legal arrangement that restricted his access to his inheritance and effectively made of him a legal minor. The modest annual allowance henceforth granted him was insufficient to clear his debts, and the resulting state of permanently straitened finances led him to still greater emotional and financial dependence on his mother and also exacerbated his growing detestation of his stepfather. The agonizing moods of isolation and despair that Baudelaire had known in adolescence, and which he called his moods of "spleen," returned and became more frequent.

Early writings. Baudelaire had returned from the South Seas in 1842 determined as never before to become a poet. From then until 1846 he probably composed the bulk of the poems that make up the first edition (1857) of *Les Fleurs du mal*. He refrained from publishing them as separate texts, however, which suggests that from the outset he had in mind a coherent collection governed by a tight thematic architecture rather than a simple sequence of self-contained poems. In October 1845 he announced the imminent appearance of a collection entitled *Les Lesbiennes* ("The Lesbians"), followed, at intervals after 1848, by *Les Limbes* ("Limbo"), the stated goal of which was to "represent the agitations and melancholies of modern youth." Neither collection ever appeared in book form, however, and Baudelaire first established himself in the Parisian cultural milieu not as a poet but as an art critic with his reviews of the Salons of 1845 and 1846. Inspired by the example of the Romantic painter Eugène Delacroix, he elaborated in his *Salons* a wide-ranging theory of modern painting, with painters being urged to celebrate and express the "heroism of modern life." In January 1847 Baudelaire published a novella entitled *La Fanfarlo* whose hero, or antihero, Samuel Cramer, is widely, if simplistically, seen as a self-portrait of the author as he agonizedly oscillates between desire for the maternal and respectable Madame de Cosmelly and the erotic actress-dancer of the title.

Thereafter little is heard of Baudelaire until February 1848, when he is widely reported to have participated in the riots that overthrew King Louis-Philippe and installed the Second Republic; one uncorroborated account has him brandishing a gun and urging the insurgents to shoot General Aupick, who was then director of the École Polytechnique. Such stories have led some to dismiss Baudelaire's involvement in the revolutionary events

of 1848-51 as mere rebelliousness on the part of a disaffected (and still unpublished) bourgeois poet. More recent studies suggest he had a serious commitment to a radical political viewpoint that probably resembled that of the socialist-anarchist Pierre-Joseph Proudhon. Baudelaire is reliably reported to have taken part both in the working-class uprising of June 1848 and in the resistance to the Bonapartist military coup of December 1851; the latter, he claimed shortly afterwards, ended his active interest in politics. Henceforth his focus would be exclusively on his writing.

Maturity and decline. In 1847 Baudelaire had discovered the work of Edgar Allan Poe. Overwhelmed by what he saw as the almost preternatural similarities between the American writer's thought and temperament and his own, he embarked upon the task of translation that was to provide him with his most regular occupation and income for the rest of his life. His translation of Poe's *Mesmeric Revelation* appeared as early as July 1848, and thereafter translations appeared regularly in reviews before being collected in book form in *Histoires extraordinaires* (1856; "Extraordinary Tales") and *Nouvelles Histoires extraordinaires* (1857; "New Extraordinary Tales"), each preceded by an important critical introduction by Baudelaire. These were followed by *Les Aventures d'Arthur Gordon Pym* (1857), *Eurêka* (1864), and *Histoires grotesques et sérieuses* (1865; "Grotesque and Serious Tales"). As translations these works are, at their best, classics of French prose, and Poe's example gave Baudelaire greater confidence in his own aesthetic theories and ideals of poetry. Baudelaire also began studying the work of the conservative theorist Joseph de Maistre, who, together with Poe, impelled his thought in an increasingly antinaturalist and antihumanist direction. From the mid-1850s Baudelaire would regard himself as a Roman Catholic, though his obsession with original sin and the Devil remained unaccompanied by faith in God's forgiveness and love, and his Christology was impoverished to the point of nonexistence.

Between 1852 and 1854 Baudelaire addressed a number of poems to Apollonie Sabatier, celebrating her, despite her reputation as a high-class courtesan, as his madonna and muse, and in 1854 he had a brief liaison with the actress Marie Daubrun. In the meantime Baudelaire's growing reputation as Poe's translator and as an art critic at last enabled him to publish some of his poems. In June 1855 the *Revue des deux mondes* published a sequence of 18 of his poems under the general title of *Les Fleurs du mal*. The poems, which Baudelaire had chosen for their original style and startling themes, brought him notoriety. The following year Baudelaire signed a contract with the publisher Poulet-Malassis for a full-length poetry collection to appear with that title. When the first edition of *Les Fleurs du mal* was published in June 1857, 13 of its 100 poems were immediately arraigned for offences to religion or public morality. After a one-day trial on August 20, 1857, six of the poems were ordered to be removed from the book on the grounds of obscenity, with Baudelaire incurring a fine of 300 (later reduced to 50) francs. The six poems were first republished in Belgium in 1866 in the collection *Les Épaves* ("Wreckage"), and the official ban on them would not be revoked until 1949. Owing largely to these circumstances, *Les Fleurs du mal* became a byword for depravity, morbidity, and obscenity, and the legend of Baudelaire as the doomed dissident and pornographic poet was born.

The last years. The failure of *Les Fleurs du mal*, from which he had expected so much, was a bitter blow to Baudelaire, and the remaining years of his life were darkened by a growing sense of failure, disillusionment, and despair. Shortly after his book's condemnation, he had a brief and apparently botched

physical liaison with Apollonie Sabatier, followed, in late 1859, by an equally brief and unhappy reunion with Marie Daubrun. Although Baudelaire wrote some of his finest works in these years, few were published in book form. After publishing his earliest experiments in prose poetry, he set about preparing a second edition of *Les Fleurs du mal*. In 1859, while living with his mother at Honfleur on the Seine River estuary, where she had retired after Aupick's death in 1857, Baudelaire produced in rapid succession a series of poetic masterpieces beginning with "Le Voyage" in January and culminating in what is widely regarded as his greatest single poem, "Le Cygne" ("The Swan"), in December. At the same time, he composed two of his most provocative essays in art criticism, the *Salon de 1859* and *Le Peintre de la vie moderne* ("The Painter of Modern Life"). The latter essay, inspired by the draftsman Constantin Guys, is widely viewed as a prophetic statement of the main elements of the Impressionist vision and style a decade before the actual emergence of that school. The year 1860 saw the publication of *Les Paradis artificiels*, Baudelaire's translation of sections of the English essayist Thomas De Quincey's *Confessions of an English Opium-Eater* accompanied by his own searching analysis and condemnation of drugs. In February 1861 a second, and greatly enlarged and improved, edition of *Les Fleurs du mal* was published by Poulet-Malassis. Concurrently Baudelaire published important critical essays on Théophile Gautier (1859), Richard Wagner (1861), Victor Hugo and other contemporary poets (1862), and Delacroix (1863), all of which would be collected after his death in *L'Art romantique* (1869). The tantalizing autobiographical fragments entitled *Fusées* ("Rockets") and *Mon cœur mis à nu* ("My Heart Laid Bare") also date from the 1850s and early '60s.

In 1861 Baudelaire made an ill-advised and unsuccessful attempt to gain election to the French Academy. In 1862 Poulet-Malassis was declared bankrupt; Baudelaire was involved in his publisher's failure, and his financial difficulties became desperate. By this time he was in a critical state both physically and psychologically, and feeling what he chillingly called "the wind of the wing of imbecility" pass over him. Abandoning verse poetry as his medium, Baudelaire now concentrated on writing prose poems, a sequence of 20 of which was published in *La Presse* in 1862. In April 1864 he left Paris for Brussels in the hope of persuading a Belgian publisher to publish his complete works. He would remain in Belgium, increasingly embittered and impoverished, until the summer of 1866, when, following a collapse in the Church of Saint-Loup at Namur, he was stricken with paralysis and aphasia from which he would never recover. Baudelaire died at age 46 in the Paris nursing home in which he had been confined for the last year of his life.

At the time of Baudelaire's death, many of his writings were unpublished and those that had been published were out of print. This was soon to change, however. The future leaders of the Symbolist movement who attended his funeral were already describing themselves as his followers, and by the 20th century he was widely recognized as one of the greatest French poets of the 19th century.

Les Fleurs du mal. Baudelaire's poetic masterpiece, the 1861 edition of *Les Fleurs du mal*, consists of 126 poems arranged in six sections of varying length. Baudelaire always insisted that the collection was not a "simple album" but had "a beginning and an end," each poem revealing its full meaning only when read in relation to the others within the "singular framework" in which it is placed.

A prefatory poem makes it clear that Baudelaire's concern is with the general human predicament of which his own is representative. The collection may best be read in the light of the concluding poem, "Le Voyage," as a journey through self and society in search of some impossible satisfaction that forever eludes the traveler.

The first section, entitled "Spleen et idéal," opens with a series of poems that dramatize contrasting views of art, beauty, and the artist, who is depicted alternately as martyr, visionary, performer, pariah, and fool. The focus then shifts to sexual and romantic love, with the first-person narrator of the poems oscillating between extremes of ecstasy ("idéal") and anguish ("spleen") as he attempts to find fulfillment through a succession of women whom it is possible, if simplistic, to identify with Jeanne Duval, Apollonie Sabatier, and Marie Daubrun. Each set of love poems describes an erotic cycle that leads from intoxication through conflict and revulsion to an eventual ambivalent tranquillity born of memory and the transmutation of suffering into art. Yet the attempt to find plenitude through love comes in the end to nothing, and "Spleen et idéal" ends with a sequence of anguished poems, several of them entitled "Spleen," in which the self is shown imprisoned within itself, with only the certainty of suffering and death before it.

The second section, "Tableaux parisiens," was added to the 1861 edition and describes a 24-hour cycle in the life of the city through which the Baudelairean traveler, now metamorphosed into a flaneur (man-about-town), moves in quest of deliverance from the miseries of self, only to find at every turn images of suffering and isolation that remind him all too pertinently of his own. The section includes some of Baudelaire's greatest poems, most notably "Le Cygne," where the memory of a swan stranded in total dereliction near the Louvre becomes a symbol of an existential condition of loss and exile transcending time and space. Having gone through the city forever meeting himself, the traveler turns, in the much shorter sections that follow, successively to drink ("Le Vin"), sexual depravity ("Fleurs du mal"), and satanism ("Révolte") in quest of the elusive ideal. His quest is predictably to no avail for, as the final section, entitled "La Mort," reveals, his journey is an everlasting, open-ended odyssey that, continuing beyond death, will take him into the depths of the unknown, always in pursuit of the new, which, by definition, must forever elude him.

Prose poems. Baudelaire's *Petite Poèmes en prose* was published posthumously in 1869 and was later, as intended by the author, entitled *Le Spleen de Paris*. He did not live long enough to bring these poems together in a single volume, but it is clear from his correspondence that the work he envisaged was both a continuation of, and a radical departure from, *Les Fleurs du mal*. Some of the texts may be regarded as authentic poems in prose, while others are closer to miniature prose narratives. Again the setting is primarily urban, with the focus on crowds and the suffering lives they contain: a broken-down street acrobat ("Le Vieux Saltimbanque"), a hapless street trader ("Le Mauvais Vitrier"), the poor staring at the wealthy in their opulent cafés ("Le Yeux des pauvres"), the deranged ("Mademoiselle Bistouri") and the derelict ("Assommons les pauvres!"), and, in the final text ("Les Bons Chiens"), the pariah dogs that scurry and scavenge through the streets of Brussels. Not only is the subject matter of the prose poems essentially urban, but the form itself, "musical but without rhythm and rhyme, both supple and staccato," is said to derive from "frequent contact with enormous cities, from the junc-

tion of their innumerable connections." In its deliberate fragmentation and its merging of the lyrical with the sardonic, *Le Spleen de Paris* may be regarded as one of the earliest and most successful examples of a specifically urban writing, the textual equivalent of the city scenes of the Impressionists, embodying in its poetics of sudden and disorienting encounter that ambiguous "heroism of modern life" that Baudelaire celebrated in his art criticism.

Influence and assessment. As both poet and critic, Baudelaire stands in relation to French and European poetry as Gustave Flaubert and Édouard Manet do to fiction and painting, respectively: as a crucial link between Romanticism and modernism and as a supreme example, in both his life and his work, of what it means to be a modern artist. His catalytic influence was recognized in the 19th century by Rimbaud, Verlaine, Mallarmé, and Swinburne and, in the 20th century, by Valéry, Rilke, and T.S. Eliot. In his pursuit of an "evocative magic" of images and sounds, his blending of intellect and feeling, irony and lyricism, and his deliberate eschewal of rhetorical utterance, Baudelaire moved decisively away from the Romantic poetry of statement and emotion to the modern poetry of symbol and suggestion. He was, said his disciple Jules Laforgue, the first poet to write of Paris as one condemned to live day to day in the city, his greatest originality being, as Verlaine wrote as early as 1865, to "represent powerfully and essentially modern man" in all his physical, psychological, and moral complexity. He is a pivotal figure in European literature and thought, and his influence on modern poetry has been immense. (R.D.E.B.)

BIBLIOGRAPHY. Most of Baudelaire's work has been translated into English. The best complete translation in verse of *Les Fleurs du mal* is *The Flowers of Evil*, trans. by James McGowan (1993); the edition by Richard Howard (trans.), *Les Fleurs du mal* (1982), won an American Book Award in 1984. *Charles Baudelaire: Selected Poems*, trans. by Carol Clark (1995), contains serviceable prose renderings of the major poems. *The Prose Poems and La Fanfarlo*, trans. by Rosemary Lloyd (1991), is also recommended. The essential critical writings can be found in *Selected Writings on Art and Artists*, trans. by P.E. Charvet (1972, reissued as *Selected Writings on Art and Literature*, 1992).

The best biography is Claude Pichois and Jean Ziegler, *Baudelaire* (1989; originally published in French, 1987). An older work by Enid Starkie, *Baudelaire* (1933, reissued 1988), is still worth consulting.

Alison Fairlie, *Baudelaire: Les Fleurs du Mal* (1960, reissued 1972); and F.W. Leakey, *Baudelaire: Les Fleurs du Mal* (1992), are valuable short introductions to the poet's major work. Stimulating and controversial studies of Baudelaire's personality and thought are to be found in Jean-Paul Sartre, *Baudelaire* (1949, reissued 1967; originally published in French, 1947); and Michel Butor, *Histoire Extraordinaire: Essay on a Dream of Baudelaire's* (1969; originally published in French, 1961). Walter Benjamin, *Charles Baudelaire: A Lyric Poet in the Era of High Capitalism* (1973, reissued 1983; originally published in German, 1969), is the starting point for any discussion of Baudelaire and modernity. Leo Bersani, *Baudelaire and Freud* (1977), perceptively discusses the love poetry. F.W. Leakey, *Baudelaire and Nature* (1969), offers an important chronological study of the evolution of his thought. Richard D.E. Burton, *Baudelaire in 1859* (1988), discusses Baudelaire's most creative year, and *Baudelaire and the Second Republic* (1991), examines his shifting political positions. The most stimulating short discussion of the prose poems is contained in Christopher Prendergast, *Paris and the Nineteenth Century* (1992).

Baudissin, Wolf Heinrich, Graf (Count) VON, in full WOLF HEINRICH FRIEDRICH KARL, COUNT VON BAUDISSIN (b. Jan. 30, 1789, Copenhagen, Den.—d. April 4, 1878, Dresden, Ger.), German diplomat and man of letters who with Dorothea Tieck was responsible for many translations of William Shakespeare

and thus contributed to the development of German Romanticism.

Baudissin served in the diplomatic corps in Stockholm, Paris, and Vienna and traveled in Italy, France, Greece, and Turkey. In 1827 he settled in Dresden, where he spent the rest of his life. The works he translated include Elizabethan drama (*Ben Jonson und seine Schule*, 2 vol., 1836; "Ben Jonson and His School"), Molière, Italian plays, and the Middle High German epics *Iwein* and *Wigalois*. From 1825 to 1833 he contributed translations of 13 of Shakespeare's plays to the German edition prepared under the direction of A.W. von Schlegel and Ludwig Tieck and continued by Tieck's daughter Dorothea; among them were *Measure for Measure*, *The Taming of the Shrew*, *Othello*, and *King Lear*.

Baudot, Jean-Maurice-Émile (b. 1845, Magneux, France—d. March 28, 1903, Sceaux), engineer who, in 1874, received a patent on a telegraph code that by the mid-20th century had supplanted Morse Code as the most commonly used telegraphic alphabet.

In Baudot's code, each letter was represented by a five-unit combination of current-on or current-off signals of equal duration; this represented a substantial economy over the Morse system of short dots and long dashes. Thus, 32 permutations were provided, sufficient for the Roman alphabet, punctuation signs, and control of the machine's mechanical functions. Baudot also invented (1894) a distributor system for simultaneous (multiplex) transmission of several messages on the same telegraphic circuit or channel.

Modern versions of the Baudot Code usually use groups of seven or eight "on" and "off" signals. Groups of seven permit transmission of 128 characters; with groups of eight, one member may be used for error correction or other function. See also teleprinter.

Baudouin (French personal name): see under Baldwin, except as below.

Baudouin I (French), Dutch BOUDEWIJN I (b. Sept. 7, 1930, Stuyvenberg Castle, near Brussels, Belg.—d. July 31, 1993, Motril, Spain), king of the Belgians from 1951 to 1993, who helped restore confidence in the monarchy after the stormy reign of King Leopold III.

The son of Leopold III and Queen Astrid, Baudouin shared his father's internment by the Germans during World War II and his postwar exile in Switzerland. After Leopold stepped down, Baudouin acted as head of state from Aug. 11, 1950, until July 16, 1951, and the next day he became the fifth king of the Belgians.

Baudouin I, 1960

© A.C.L., Brussels

During his long reign Baudouin served effectively as a unifying force in a country deeply divided into Flemish- and French-speaking factions, and he was respected for the impartiality with which he treated the two groups. He recognized early the imminence of Congolese independence and made a fact-finding tour of the Belgian Congo in December 1959; he proclaimed its independence at Léopoldville (now Kinshasa, Zaire) on June

30, 1960. Baudouin was criticized, however, for his 1990 decision to step down for one day rather than assent to a government bill legalizing abortion; he was reinstated by parliament after its passage.

On Dec. 15, 1960, Baudouin married a Spanish noblewoman, Doña Fabiola de Mora y Aragón. Because the royal couple were childless, Baudouin was succeeded by his brother, Prince Albert.

Baudouin de Courtenay, Jan Niecisław (b. March 13, 1845, Radzymin, Pol., Russian Empire [now in Poland]—d. Nov. 3, 1929, Warsaw, Pol.), linguist who regarded language sounds as structural entities, rather than mere physical phenomena, and thus anticipated the modern linguistic concern with language structure. His long teaching career in eastern European universities began in 1871 and included professorships at the universities of St. Petersburg (1900–14) and Warsaw.

Although he was a specialist in comparative linguistics, Baudouin de Courtenay turned to general problems, including questions of language mixture, children's speech, and the effect of linguistic structure on world outlook. He introduced the linguistic term phoneme to denote a speech sound that distinguishes meaning; e.g., the *b* in "bit" that distinguishes it from "pit," "fit," and "sit." Views expressed in his major work, *Versuch einer Theorie phonetischer Alternationen* (1895; "Essay on a Theory of Phonetic Alternation"), have become a part of modern linguistic science. A *Baudouin de Courtenay Anthology: The Beginnings of Structural Linguistics* (1972) was translated by Edward Stankiewicz.

Bauer, Georg; see Agricola, Georgius.

Bauer, Gustav (Adolf) (b. Jan. 6, 1870, Darkehmen, East Prussia [now Ozersk, Russia]—d. Sept. 16, 1944, Berlin, Ger.), German statesman, chancellor of the Weimar Republic (1919–20).

As a Königsberg office worker, Bauer in 1895 founded the Office Employees Association, over which he presided until 1908. Entrusted with the leadership of the Central Workers' Secretariat of the Free Trade Unions in Berlin (1903), he subsequently served as second chairman of the General Commission of Trade Unions for all of Germany (1908–18). As a Social Democrat member of the Reichstag, he was appointed secretary of the new Labour Ministry in the last imperial cabinet under Prince Max of Baden (October 1918), and later, under the Weimar constitution, he served as minister of labour in the government of Philipp Scheidemann (February–June 1919). He was raised to the chancellorship after the resignation of Scheidemann (June 1919) and was charged with the thankless task of securing ratification of what the Germans called "the peace of injustice"—the Treaty of Versailles. Resigning the chancellorship shortly after an abortive anti-governmental coup (the Kapp Putsch of March 1920) during which the cabinet, with the exception of the vice-chancellor, had left Berlin, he was subsequently retained in the governments of Hermann Müller and Joseph Wirth as minister of the treasury and vice-chancellor.

Bauer, Harold (b. April 28, 1873, Kingston-Thames, near London, Eng.—d. March 12, 1951, Miami, Fla., U.S.), British-born American pianist who introduced to the United States contemporary works by Claude Debussy, Maurice Ravel, and César Franck. His playing combined traits of both 19th-century Romanticism and 20th-century restraint and was noted for its sensitivity, free approach to the printed note, and lack of egocentricity.

Bauer was originally a concert violinist until about age 19, when he began serious study of the piano; in both instruments he was almost completely self-taught. He toured widely from 1893 and became a U.S. citizen in 1921.

Bauer frequently appeared in trios, as with Pablo Casals and Fritz Kreisler, and in joint recitals, as with the violinist Jacques Thibaud. His extensive repertory included 17th- and 18th-century harpsichord and clavichord works as well as the standard piano works. He wrote an autobiography, *Harold Bauer: His Book* (1948), and transcribed many works for piano.

Bauer, Otto (b. Sept. 5, 1881, Vienna, Austria-Hungary—d. July 4, 1938, Paris, France), theoretician of the Austrian Social Democratic Party and statesman, who proposed that the nationalities problem of the Austro-Hungarian Empire be solved by the creation of nation-states and who, after World War I, became one of the principal advocates of Austrian *Anschluss* (unification) with Germany.

A founder of the socialist educational movement *Die Zukunft* ("The Future") and contributor to various periodicals, Bauer became secretary to his party's parliamentary faction

Otto Bauer

By courtesy of the Bild-Archiv, Österreichische Nationalbibliothek, Vienna

in 1904. His theoretical talents were revealed with the publication of *Die Nationalitätenfrage und die Sozialdemokratie* (1907; "The Nationalities Question and Social Democracy"), in which he viewed the conflict among the nationalities as a class struggle and foresaw many of the actual post-World War I developments in the Danubian region.

A soldier and prisoner of war in Russia during World War I, Bauer assumed leadership of his party's left wing on his return in 1917. He became Austrian foreign minister at the end of the war. On March 2, 1919, he signed the secret *Anschluss* agreement with Germany, which was later rejected by the Allies. Bauer deals with this period in his *Die österreichische Revolution* (1923; *The Austrian Revolution*). He resigned in July 1919, but he remained his party's guiding personality for the next two decades. A member of the Austrian National Council from 1929 to 1934, he went into exile after the abortive Viennese socialist revolt in 1934, first to Czechoslovakia, then to France.

Bauer, Sebastian Wilhelm Valentin (b. Dec. 23, 1822, Dillingen, Bavaria [Germany]—d. June 20, 1875, Munich, Ger.), German pioneer inventor and builder of submarines.

In 1850 Bauer built his first submarine, *Le Plongeur-Marin* ("The Marine Diver"), which in February 1851 sank in 50 feet (15 m) of water during a test dive in Kiel Harbour, trapping Bauer and his two crewmen. Although Bauer realized the hatch could be opened when the pressure of the air inside the hull, compressed by water leaking into the submarine, matched the water pressure outside, he had difficulty preventing his crew from panicking. When the pressure was at last equalized, the hatch was opened and the men swam to the surface, emerging, after 7½ hours below, in the midst of their own funeral services.

In 1855, sponsored by Grand Duke Con-

stantine of Russia, Bauer built the 52-foot iron submarine *Le Diable-Marin* ("The Marine Devil"), carrying a crew of 11, 4 of whom worked a treadmill that drove a screw propeller. Through windows in this submarine Bauer made what were probably the first underwater photographs. He also experimented with underwater sound for signaling and with a system for purifying the air in submerged craft.

Discouraged by conservative naval officers, Bauer left Russia in 1858 but was unable to find other sponsors. In 1869 ill health forced his retirement in Munich.

Bauernfeld, Eduard von (b. Jan. 13, 1802, Vienna, Austria—d. Aug. 9, 1890, Vienna), Austrian dramatist who dominated the Vienna Burgtheater for 50 years with his politically oriented drawing room comedies.

Bauernfeld studied philosophy and law at Vienna University before turning to the theatre. Active in the local liberal movement, he became friends with the composer Franz Schubert and the dramatist Franz Grillparzer; the latter greatly influenced his style. Bauernfeld's comedies are witty portrayals of Viennese society; cleverly plotted and elegant in language, they also addressed the acute social and political questions of the day. His most successful works included *Das Liebes-Protokoll* (1834; "The Love Protocol"), *Die Bekenntnisse* (1834; "The Confession"), *Bürgerlich und romantisch* (1835; "Bourgeois and Romantic"), *Grossjährig* (1846; "Adult"), *Krisen* (1852; "Crises"), and *Aus der Gesellschaft* (1867; "From Society").

Bauer's test (medicine): see galactose tolerance test.

Baugh, Sammy, byname of SAMUEL ADRIAN BAUGH (b. March 17, 1914, Temple, Texas, U.S.), first outstanding quarterback in the history of American professional football, who led the National Football League (NFL) in forward passing in 6 of his 16 seasons (1937–52) with the Washington Redskins. On two occasions (Oct. 31, 1943, and Nov. 23, 1947) he passed for six touchdowns in a single game. He also excelled as a punter and as a defensive halfback.

After graduation from Texas Christian University, Fort Worth, in 1937, Baugh joined the Redskins and also the St. Louis Cardinals baseball organization, for which he played shortstop in the minor leagues for a few years. Immediately successful in professional football, he led the NFL in passing in 1937, 1940, 1943, 1945, 1947, and 1949, and in average yards per punt in 1940–43. In 1945 he completed 70.3 percent of his passes (128 of 182), and in 1940 he averaged 51.3 yards per punt. As a defensive back he led the NFL in 1943 by intercepting 11 passes. He had a career record of 1,693 pass completions in 2,995 attempts (56.5 percent) for 21,886 yards and 186 touchdowns.

Baugh was head coach of two American Football League teams, the New York Titans (afterward Jets) in 1960–61 and the Houston Oilers in 1964. He was elected to the professional football Hall of Fame in 1963.

Bauhaus, in full STAATLICHES BAUHAUS (German: "Public House of Building"), school of design, architecture, and applied arts that existed in Germany from 1919 to 1933. It was based in Weimar until 1925, Dessau through 1932, and Berlin in its final months. The Bauhaus was founded by the architect Walter Gropius, who combined two schools, the Weimar Academy of Arts and the Weimar School of Arts and Crafts, into what he called the Bauhaus, or "house of building," a name derived by inverting the German word *Hausbau*, "building of a house." Gropius' "house

of building" included the teaching of various crafts, which he saw as allied to architecture, the matrix of the arts. By training students equally in art and in technically expert craftsmanship, the Bauhaus sought to end the schism between the two.

Beginning in the mid-19th century, reformers led by the English designer William Morris had sought to bridge the same division by emphasizing high-quality handicrafts in combination with design appropriate to its purpose. By the last decade of that century, these efforts had led to the Arts and Crafts Movement (*q.v.*). While extending the Arts and Crafts attentiveness to good design for every aspect of daily living, the forward-looking Bauhaus rejected the Arts and Crafts emphasis on individually executed luxury objects. Realizing that machine production had to be the precondition of design if that effort was to have any impact in the 20th century, Gropius directed the school's design efforts toward mass manufacture. On the example of Gropius' ideal, modern designers have since thought in terms of producing functional and aesthetically pleasing objects for mass society rather than individual items for a wealthy elite.

Before being admitted to the workshops, students at the Bauhaus were required to take a six-month preliminary course taught variously by Johannes Itten, Josef Albers, and László Moholy-Nagy. The workshops—carpentry, metal, pottery, stained glass, wall painting, weaving, graphics, typography, and stagecraft—were generally taught by two people: an artist (called the Form Master), who emphasized theory, and a craftsman, who emphasized techniques and technical processes. After three years of workshop instruction, the student received a journeyman's diploma.

The Bauhaus included among its faculty several outstanding artists of the 20th century. In addition to the above-mentioned, some of its teachers were Paul Klee (stained-glass and painting), Wassily Kandinsky (wall painting), Lyonel Feininger (graphic arts), Oskar Schlemmer (stagecraft and also sculpture), Marcel Breuer (interiors), Herbert Bayer (typography and advertising), Gerhard Marcks (pottery), and Georg Muche (weaving). A severe but elegant geometric style carried out with great economy of means has been considered characteristic of the Bauhaus, though in fact the works produced were richly diverse.

Although Bauhaus members had been involved in architectural work from 1919 (notably, the construction in Dessau of administrative, educational, and residential quarters designed by Gropius), the department of architecture, central to Gropius' program in founding this unique school, was not established until 1927; Hannes Meyer, a Swiss architect, was appointed chairman. Upon Gropius' resignation the following year, Meyer became director of the Bauhaus until 1930. He was

asked to resign because of his left-wing political views, which brought him into conflict with Dessau authorities. Ludwig Mies van der Rohe became the new director until the Nazi regime forced the school to close in 1933.

The Bauhaus had far-reaching influence. Its workshop products were widely reproduced, and widespread acceptance of functional, unornamented designs for objects of daily use owes much to Bauhaus precept and example. Bauhaus teaching methods and ideals were transmitted throughout the world by faculty and students. Today, nearly every art curriculum includes foundation courses in which, on the Bauhaus model, students learn about the fundamental elements of design. Among the best known of Bauhaus-inspired educational efforts was the achievement of Moholy-Nagy, who founded the New Bauhaus (later renamed the Institute of Design) in Chicago in 1937, the same year in which Gropius was appointed chairman of the Harvard School of Architecture. A year later Mies moved to Chicago to head the department of architecture at the Illinois Institute of Technology (then known as the Armour Institute), and eventually he designed its new campus.

Bauhin, Gaspard, also called CASPER BAUHIN (b. Jan. 17, 1560, Basel, Switz.—d. Dec. 5, 1624, Basel), Swiss physician, anatomist, and

Gaspard Bauhin, detail from an engraving

botanist who introduced a scientific binomial system of classification to both anatomy and botany.

A student of the Italian anatomist Fabricius ab Aquapendente at the University of Padua, Italy (1577–78), he spent most of his career at the University of Basel (M.D., 1581), where he was appointed professor of Greek (1582), anatomy, botany (1588), and medicine (1614). One of the first to describe (1588) the ileocecal (Bauhin's) valve, located between the large and small intestines, Bauhin wrote the *Theatrum anatomicum* (1605; *Microcosmographia, A Description of the Body of Man*), considered the finest comprehensive anatomy

text to that time. In this work he replaced the ambiguous practice of numbering muscles, vessels, and nerves with a system that named parts according to their most salient features.

Refining the principles of systematic botanical classification developed by the 16th-century Italian botanist Andrea Cesalpino, Bauhin was first to clearly delineate botanical species and groups of species, or genera, utilizing the concept of natural relationships, or "affinities," as criteria for his classifications. In his *Pinax theatri botanica* (1623; "Illustrated Exposition of Plants"), the most celebrated of the early attempts to name and catalog all known kinds of plants, he listed and described briefly about 6,000 species, while introducing the practice of naming plants by their genus and species (binomial nomenclature), a system that found wide application by the botanists John Ray and Linnaeus.

Bauhin's brother Jean (1541–1613), also a physician and botanist, is known for his *Historia plantarum universalis* (1650–51; "General History of Plants"), in which he rendered elaborate descriptions of more than 5,000 species.

Bāul, member of an order of religious singers of Bengal known for their unconventional behaviour and for the freedom and spontaneity of their mystical verse. Their membership consists both of Hindus (primarily Vaiṣṇavites, or followers of Lord Vishnu) and Muslims (generally Sufis, or mystics). Their songs frequently deal with the love between the human personality and a personal god, who resides within the individual. Little is known of the development of the cult, as their songs began to be collected and written down only in the 20th century. Rabindranath Tagore was one of many Bengali authors who acknowledged an indebtedness of inspiration to Bāul verse.

Baule, people inhabiting the Côte d'Ivoire (Ivory Coast) between the Komoé and Bandama rivers; they are an Akan group, speaking a Twi language of the Kwa branch of the Niger-Congo family.

The ancestors of the Baule were a section of the Ashanti who emigrated to their present location under the leadership of Queen Awura

Pokou about 1750, following a dispute over the chieftaincy, and assimilated many of the indigenous peoples. After 1790 quarrels between important families destroyed the politi-

ical unit of the Baule, though they continued to rule much of the Ivory Coast until the end of the 19th century.

The Baule live in compact villages divided into wards, or quarters, and subdivided into family compounds of rectangular dwellings arranged around a courtyard; the compounds are usually aligned on either side of the main village street.

The Baule are agriculturists; yams are the staple, supplemented by fish and game; coffee and cocoa are major cash crops. The importance of the yam is demonstrated in an annual harvest festival in which the first yam is symbolically offered to the ancestors, whose worship is a prominent aspect of Baule religion.

The foundation of Baule social and political institutions is the matrilineal lineage; each lineage has ceremonial stools that embody ancestral spirits. Paternal descent is recognized, however, and certain spiritual and personal qualities are believed to be inherited through it. A headman and a council of elders representing the lineages handle village affairs.

The Baule are noted for their fine wooden sculpture, particularly for their ritual statuettes representing ghosts or spirits; these, as well as carved ceremonial masks, were formerly associated with the ancestor cult but are increasingly produced for commercial purposes.

Baum, L(yman) Frank (b. May 15, 1856, Chittenango, N.Y., U.S.—d. May 6, 1919, Hollywood, Calif.), American writer known for his series of books for children about the imaginary land of Oz.

Baum began his career as a journalist, initially in Aberdeen, S.D., then in Chicago. His first book, *Father Goose* (1899), was a commercial success, and he followed it the next year with the even more popular *Wonderful Wizard of Oz*. A modern fairy tale, it tells the story of Dorothy, a Kansas farm girl who is blown by a cyclone to the land of Oz, where she is befriended by such memorable characters as a Tin Woodman, a Scarecrow, and a Cowardly Lion. In 1901 it was produced as a musical spectacle in Chicago. Its film version, in 1939, became a cinema classic and was made familiar to later generations of children through frequent showings on television.

Baum wrote 13 more Oz books, and the series was continued by another after his death. Using a variety of pen names as well as his own, Baum wrote some 60 books, the bulk of them juveniles, popular in their day.

Baum, Vicki, original name HEDWIG BAUM (b. Jan. 24, 1888, Vienna, Austria-Hungary [now in Austria]—d. Aug. 29, 1960, Hollywood, Calif., U.S.), Austrian-born American novelist whose *Menschen im Hotel* (1929; "People at the Hotel"; Eng. trans. *Grand Hotel*) became a best-seller and was adapted as a successful play (1930), an Academy Award-winning film (1932), a film musical (1945; renamed *Weekend at the Waldorf*), and a Broadway stage musical (1989).

Baum studied music at the Vienna Conservatory but in her teens turned to writing. After a failed marriage and failed finances, she moved to Darmstadt and then to Berlin, where she became employed at the magazine *Berliner Illustrierte Zeitung*. She had already finished *Menschen im Hotel*, and it first appeared serially in the magazine. It achieved immediate success in Germany and became one of the most popular examples of the "group" novel, in which a variety of people are thrown together and work out their interrelated destinies. She rewrote it as a play, which Max Reinhardt presented and which, in translation as *Grand Hotel*, appeared on Broadway. After her New York success, she moved to the United States, becoming a screenwriter in Hollywood in 1932. In 1938 she became an American citizen.

Baum also wrote the novels *Men Never*

Know (1935), *Shanghai '37* (1939), *Grand Opera* (1942), *Hotel Berlin '43* (1944), *Mortgage on Life* (1946), *Danger from Deer* (1951), *The Mustard Seed* (1953), *Written on Water* (1956), and *Theme for Ballet* (1958).

Baumann Peak, also called MOUNT AGOU, French PIC BAUMANN, or MONT AGOU, mountain in southwestern Togo, near the border with Ghana. An extreme western outlier of the Atacora Chain of adjacent Benin, it rises to 3,235 feet (986 m) and is the highest point in Togo. It was named for Oskar Baumann (1864–99), an Austrian-African explorer, when Togo (then called Togoland) was a German colony (1880s to World War I).

Baumbach, Rudolf (b. Sept. 28, 1840, Kranichfeld, Thuringia [Germany]—d. Sept. 21, 1905, Meiningen, Ger.), German writer of popular student drinking songs and of narrative verse.

Baumbach was a poet of the vagabond school and wrote, in imitation of Viktor von Scheffel, many excellent drinking songs, such as "Die Lindenwirtin" ("The Linden Hostess"), which endeared him to the German student world. His real strength, however, lay in narrative verse, especially concerning the scenery and life of his native Thuringia. Among his best-known works are *Frau Holde* (1881), *Spielmannslieder* (1882; "Songs of a Troubadour"), and *Von der Landstrasse* (1882; "On the Highway").

Baumes Laws, several statutes of the criminal code of New York state, U.S., enacted on July 1, 1926—most notably, one requiring mandatory life imprisonment for persons convicted of a fourth felony. A "three-time loser" was thus one who had thrice been convicted of a felony and faced life imprisonment if convicted again.

In 1926 the New York State Crime Commission, chaired by Caleb H. Baumes, proposed a number of reforms and revisions of the criminal code to the state legislature. The most forceful recommendation was the Habitual Criminal Act. It provided for increasingly heavy sentences to repetitive felons. Although the clause providing for mandatory life imprisonment for a fourth felony had been a state statute since 1907, the Baumes Laws closed loopholes that had rendered the previous law ineffective. Baumes Laws, based on the principle that repression is the best method of eliminating crime, became a model for criminal-code reform in other states.

Baumgarten, Alexander Gottlieb (b. July 17, 1714, Berlin, Prussia [Germany]—d. May 26, 1762, Frankfurt an der Oder), German philosopher and educator who coined the term aesthetics and established this discipline as a distinct field of philosophical inquiry.

As a student at Halle, Baumgarten was strongly influenced by the works of G.W. Leibniz and by Christian Wolff, a professor and systematic philosopher. He was appointed extraordinary professor at Halle in 1737 and advanced to ordinary professor at Frankfurt an der Oder in 1740.

Baumgarten's most significant work, written in Latin, was *Aesthetica*, 2 vol. (1750–58). The problems of aesthetics had been treated by others before Baumgarten, but he both advanced the discussion of such topics as art and beauty and set the discipline off from the rest of philosophy. His student G.F. Meier (1718–77), however, assisted him to such an extent that credit for certain contributions is difficult to assess. Immanuel Kant (1724–1804), who used Baumgarten's *Metaphysica* (1739) as a text for lecturing, retained Baumgarten's use of the term aesthetics to apply to the entire field of sensory knowledge. When combined with logic, aesthetics formed a larger discipline that he called "gnoseology," or theory of knowledge, which to other philosophers has been known as epistemology. Only later was

the term aesthetics restricted to questions of beauty and of the nature of the fine arts.

In Baumgarten's theory, with its characteristic emphasis on the importance of feeling, much attention was concentrated on the creative act. For him it was necessary to modify the traditional claim that "art imitates nature" by asserting that artists must deliberately alter nature by adding elements of feeling to perceived reality. In this way, the creative process of the world is mirrored in their own activity.

Baumgarten wrote *Ethica Philosophica* (1740; "Philosophic Ethic"), *Acroasis Logica* (1761; "Discourse on Logic"), *Jus Naturae* (1763; "Natural Law"), *Philosophia Generalis* (1770; "General Philosophy"), and *Praelectiones Theologicae* (1773; "Lectures on Theology"). His brother, Siegmund Jakob Baumgarten, was an influential Wolffian theologian.

Baunsgaard, Hilmar (Tormod Ingolf) (b. Feb. 26, 1920, Slagelse, Den.—d. June 30, 1989), Denmark's leading nonsocialist politician during the 1960s and '70s. He served as prime minister of a coalition government from 1968 until 1971.

Entering the Radical Party's youth organization in 1936, Baunsgaard rose to become its chairman in 1948. He remained in that office until 1957; then, after a successful career in the grocery industry, he entered the Folketing (parliament). The recognized spokesman of the Radical Party, he became minister of commerce in 1961 in the Cabinet of Viggo Kampmann, continuing in that post until 1964. From 1964 to 1968 he served as director of an advertising firm, and in 1968 he became prime minister of a nonsocialist coalition government. During his term in office Baunsgaard successfully supported the abolition of the pornography laws as well as Danish entry into the European Economic Community (EEC). During his tenure, however, the economy worsened, and the government was forced to increase taxes. After the socialists regained power in the 1971 general election, Baunsgaard remained leader of the Radical Liberals. He retired from the Folketing in 1977 to return to the private sector as chairman of the daily newspaper *Politiken*.

Baur, Ferdinand Christian (b. June 21, 1792, Schmiden, near Stuttgart, Württemberg [Germany]—d. Dec. 2, 1860, Tübingen), German theologian and scholar who initiated the Protestant Tübingen school of biblical criticism and who has been called the father of modern studies in church history.

Educated at the seminary at Blaubeuren and at the University of Tübingen, Baur became a professor of theology in 1817 at the seminary and in 1826 at the university, where he remained until his death. Influenced by the thought of the German philosopher G.W.F. Hegel, Baur began to develop a new perspective on the history of Christianity.

Baur, detail from an engraving by Conrad Kull, 1859

By courtesy of the Universitätsbibliothek Tübingen, Germany

In general, Hegel saw history as a working out of opposing forces—thesis and antithesis—which interact and form a third force, known as the synthesis. In studying the New Testament's pastoral letters, Baur came to view early Christianity as the outcome of a conflict between Jewish Christianity (an amalgam of practices of the two faiths) and Gentile Christianity (which was viewed as free of Jewish influence). Baur held that Jewish Christianity was the thesis; the Gentile version was the antithesis, or reaction; and catholic Christianity constituted the Hegelian synthesis.

In his *Paulus, der Apostel Jesu Christi* (1845; *Paul, the Apostle of Jesus Christ*), Baur applied the same principles to the life and thought of the apostle Paul and concluded that Paul did not write all of the letters then attributed to him. Baur considered only the letters to the Galatians, Corinthians, and Romans to be genuinely Pauline. In addition, he believed that the author of Acts was postapostolic; Acts appeared to him to synthesize and harmonize the conflict between Jewish and Gentile Christianity and hence could not have been written in the 1st century, when a portrayal of Jewish and Gentile Christianity would have shown more clearly the conflict between them.

Baur took a similar view of the authorship of the Gospels; his conclusions became known as the "tendency theory," for he asserted that the Gospels reveal a mediating, or conciliatory, *Tendenz* of their authors to overcome the Jewish-Gentile conflict. Baur posited the existence of an initial Gospel modified by later writers.

Later in life Baur concentrated on church history. His five-volume *Geschichte der christlichen Kirche* (1853–63; "History of the Christian Church") is still considered valuable, as are his works on the doctrines of the Atonement, the Trinity, and the Incarnation. Baur's methods helped to make Christianity subject to critical historical examination. His ideas were rejected at first, but both his methods and his conclusions emerged in the 20th century as important contributions to biblical scholarship and the study of church history.

Bauria, extinct genus of advanced reptiles found as fossils in South African rocks of the Early Triassic Period (245 to 240 million years ago). The skull of *Bauria* had several mammallike features. A secondary palate separates air and food passages. The teeth show

Skull of *Bauria*

specialization and are differentiated into a set of incisor-like, caninelike, and molarlike cheek teeth. A single bone, the dentary, dwarfs the other lower jawbones, a trend toward the mammalian condition of only one bone, the dentary. *Bauria* and its relatives did not survive the Early Triassic.

Bauru, city, central São Paulo *estado* ("state"), Brazil, lying near the Batalha River at 1,640 feet (500 m) above sea level. Formerly known as Divino Espírito da Fortaleza, it was given town status in 1887 and was made the seat of a municipality in 1896. Bauru is a trade centre for an agricultural region (coffee, cot-

ton, peanuts [groundnuts], rice, *feijão* [beans], and corn [maize]). It is also a manufacturing centre producing textiles, ceramics, furniture, shoes, and other goods. An important railroad junction 190 miles (300 km) northwest of São Paulo, the state capital, Bauru is also accessible by highway and air. Pop. (1990 prelim.) 310,208.

Bauta, city, northwestern La Habana *provincia*, west-central Cuba. It is a commercial and manufacturing centre for the surrounding agricultural lands, known primarily for their tobacco and sugarcane, although pineapples and various other fruits and vegetables also are grown. The city contains cigar factories and a cotton mill. Goods are shipped via the central highway to the urban markets in Havana, 15 miles (24 km) northeast. Pop. (1991) 34,072.

Bautzen, city, Saxony *Land* (state), eastern Germany, in the Oberlausitz (Upper Lusatia) region, on a granite elevation above the Spree River. It was originally the Slavic settlement of Budissin (Budyšin), and the Peace of Bautzen was concluded there in 1018 between the German king Henry II and the Polish king Boleslaw I. Bautzen became German in 1033, passing to Bohemia in 1319 and to Saxony in 1635. The capital of the Federation of Lusatian cities in 1346, it was and is an important political and cultural centre of the Lusatian Sorbs, a West Slavic people also called the Wends, or Domowina. Sorb traditions and customs are kept alive by the Bautzen Institute for Sorbian Folk Research and the Institute for Sorbian Studies, both located in the city. Bautzen gives its name to the hard-fought battle of May 20–21, 1813, in which French troops under Napoleon I defeated a Russo-Prussian army. Notable buildings include the Ortenburg Castle (1483–86) and St. Peter's Church (1220–1497), which has been shared since 1523 by both Roman Catholics and Protestants and has, since 1921, served as the Roman Catholic cathedral and seat of the bishop of Meissen.

A railway junction, Bautzen's industries include wagon and vehicle building, iron foundries, and the manufacture of electrotechnical equipment, machinery, paper, and textiles. It is also the site of the School of Conveyor Engineering. Pop. (1998 est.) 42,884.

bauxite, rock largely composed of a mixture of hydrous aluminum oxides. Bauxite is the principal ore of aluminum.

Bauxites vary physically according to the origin and geologic history of their deposits: some deposits are soft, easily crushed, and structureless; some are hard, dense, and pisolitic, or pealike; still others are porous but strong or are stratified or largely pseudomorphous after parent rock. The laterite type is commonly pisolitic and mottled, with pisolites ranging in size from about 2.5 mm (0.10 inch) to 25 cm (10 inches) or more in diameter. Both pisolites and groundmass (matrix) may exhibit great colour variations; common colours are pink, cream, red, brown, yellow, and gray. Exposed surfaces of lateritic ore are rough, often lava-like, with a wormlike structure and variegated colours on vertical faces. Such material tends to harden or reconsolidate on exposure to air. Although terra-rossa types are granular and earthy, they also may possess pisolitic structures.

Bauxite is formed by the thorough weathering of many different rocks. Clay minerals commonly represent intermediate stages, but some bauxites appear to be reworked chemical precipitates rather than simple alteration products. Bauxite may grade into laterite or clay, laterally or vertically.

Constituent minerals are rarely recognizable in hand specimens, and even in thin sections complete identification may be difficult. Combined petrography, X-ray diffraction, and

differential thermal analysis have shown that gibbsite, boehmite, and diasporite, alone or in mixtures, are the constituent minerals. Clay minerals, hematite, magnetite, goethite, siderite, and quartz are common impurities. Most deposits contain rutile, anatase, zircon, and other minerals.

Bauxite is found in most countries, but the larger deposits occur in the tropics. Monohydrate ores have been extensively mined, for example, in France, Italy, and Greece; and trihydrate ores in Arkansas, U.S., and in Suriname, Guyana, and Jamaica. Gibbsite-rich ores occur in Ghana, Guinea, India, and Brazil. Major deposits of gravels mixed with sand were discovered in Australia in the 1950s. Deposits in the Ural Mountains and in northern Asia are largely diasporite.

Bāvand DYNASTY, also spelled BĀVEND (665–1349), Iranian dynasty that ruled Ṭabaristān in what is now northern Iran.

The Bāvands ruled, sometimes independently and at other times as vassals of various Islāmic dynasties, over an area delimited by the Caspian Sea and the Elburz Mountains. The geographic isolation of Bāvand territories permitted a degree of historical continuity.

The origins and early years of the dynasty are clouded by myth and legend. The Bāvands can be divided into three distinct lines: the Kā'ūsīyeh (665–c. 1006), the Espahbadiyeh (1074–1210), and the Kinkhvāriyeh (c. 1238–1349).

The first line, the Kā'ūsīyeh, ruled independently over their mountainous kingdom. In 854 they were converted to Islām. In the 10th century their power weakened; they maintained their position by various marriage alliances with the Zeyārid dynasty of northern Iran, but from 1006 they became vassals of that dynasty.

The Espahbadiyeh line, centred at Sārī, was originally a tributary of the Seljuq dynasty. Rostam I (reigned 1140–63) reasserted the independence of the Bāvand dynasty, but soon afterward, with the assassination of Shams ol-Molk Rostam II (reigned 1206–10), the Espahbadiyeh line was vanquished by the Khwārezm-Shāh dynasty.

The third, or Kinkhvāriyeh, line was founded by Ḥosām od-Dowleh (reigned 1238–49) and was centred at Āmol. It was a vassal of the Il-Khanid rulers of Iran. This line was finally extinguished with the assassination of Fakr od-Dowleh (reigned 1334–49).

Bavaria, German BAYERN, largest *Land* (state) of Germany. It comprises the entire southeast portion of Germany. Bavaria is bounded on the west by the *Länder* of Baden-Württemberg and Hesse, on the north by the *Länder* of Thuringia and Saxony, on the east by the Czech Republic, and on the south and southeast by Austria. Munich (München) is the capital.

History. The earliest known inhabitants in the area of present-day Bavaria were the Celts. In the last decade BC they were pressed between Teutonic tribes in the north and the Romans in the south. The Romans soon conquered the region; they divided the southern part into Raetia and Noricum and built fortifications along the northern boundary to keep out the Teutons. Flourishing Roman colonies arose in the south at Augsburg, Kempten, Regensburg, and Passau.

The Romans were overcome in the 5th century by repeated Germanic attacks. The lands were eventually settled by Germanic tribes from the east and north who mixed with the remaining Celts and Romans. The tribe that

gave the territory its name was the Baiuvarii (Bavarians), who settled in the south between AD 488 and 520. From about 555 to 788 the Bavarians were ruled by Frankish dukes of the Agilolfing family. In the 7th and 8th centuries Bavaria was Christianized by Irish and Scottish monks (St. Boniface, St. Korbinian, St. Emmeram, and St. Rupert). The last duke of the Agilolfing family, Tassilo III, was deposed in 788 by Charlemagne, who incorporated Bavaria into the Carolingian empire.

After the partitioning of the Carolingian empire in 817, the duchy of Bavaria was given to Louis the Pious and then to his son Louis the German, king of the East Franks. Bavaria became a part of the Holy Roman Empire in the 10th century, though it retained its own dukes. During this period Bavaria was constantly ravaged and all but depopulated by the Hungarians. At the Battle of Pressburg (Bratislava) on July 4, 907, the Hungarians inflicted a disastrous defeat on the Bavarians but by 909 had been driven back out of the territory. In 1180 the Holy Roman emperor Frederick I Barbarossa gave Bavaria to the count palatine Otto of Wittelsbach. This marked the start of the Wittelsbach dynasty, which was to rule Bavaria until 1918.

When Otto was invested with Bavaria, the duchy was bounded by the Bohemian Forest, the Inn, the Alps, and the Lech; and the power of the duke was practically confined to his extensive private domains around Wittelsbach, Kelheim, and Straubing. Otto was succeeded in 1183 by his son Louis I, who took a leading part in German affairs and was the real founder of the Bavarian principality. He recklessly used every means to extend his power. He increased his dominion, especially toward the east and north, by astute policy, by inheritance, by purchase, by feudal acquisitions, and by force; he founded cities (Landshut, Straubing, Landau, and Iser) and also won the Palatinate of the Rhine (1214). His son Otto II increased the area of his lands mainly by purchases. The efforts of these and succeeding dukes to consolidate their power over the duchy were fairly successful; but their efforts were soon vitiated by partitions among different members of the family—partitions that for 250 years made the political history of Bavaria little more than a chronicle of territorial divisions, family feuds, and petty squabbles. By the late 14th century the family's various branches had divided Bavaria into three separate duchies. The main result of the threefold division was the temporary eclipse of Bavaria. Neighbouring states encroached upon its borders, and the nobles ignored the authority of the dukes, who for many years were mainly occupied with internal strife. This condition of affairs, however, was not wholly harmful. The government of the country and the control of the finances passed mainly into the hands of an assembly called the Landtag, or Landschaft, which had existed since the beginning of the 14th century. The towns, assuming a certain independence, became strong and wealthy as trade increased, and the citizens of Munich were often formidable antagonists to the dukes. Thus, a period of disorder saw the growth of representative institutions and a strong civic spirit. The country was also enriched by a many-sided intellectual and artistic life in the individual, newly risen courts and by very able administrations.

A consolidation began when Duke Albert IV the Wise of Bavaria-Munich (reigned 1467–1508) established in 1506 the principle of primogeniture in Bavaria. Albert also made Munich the capital of his duchy. Albert's son William IV (reigned 1508–50) was finally able to reunify Bavaria into one duchy in 1545. William IV opposed the Protestant Reformation as a threat to his authority, but he did not allow his Roman Catholicism to interfere with political considerations. He was usually to be found in opposition to the Austrian Habs-

burgs and allied himself with the Protestant princes of the Schmalkaldic League. In 1546, however, Bavarian policy changed abruptly to an alliance with the Habsburgs, following the introduction of the Reformation in the Palatinate. Under William IV's successor, Albert V (1550–79), Bavaria became a strictly Roman Catholic territory. Duke Maximilian I (1597–1651) fought on the side of the Habsburgs in the Thirty Years' War (1618–48) and by his leadership increased Bavaria's prestige, gaining territorial accessions and attaining for himself the title of elector. Throughout the 18th century Bavaria was ravaged by the wars of the Spanish Succession and the Austrian Succession. In 1777 the Bavarian succession passed to the elector Charles Theodore of the Palatinate. Bavaria and the Palatinate were reunited. In the War of the Bavarian Succession (1778–79), Frederick II the Great of Prussia successfully prevented Austria from incorporating a large part of Bavaria to which it had laid claim.

In the 1790s Bavaria was a member of the first and second anti-French coalitions, and for its pains it was successively occupied by Revolutionary France (1796), by Austria (1799), and then again by France (1800). In the following year Bavaria became an ally of France and was thus able to expand its territories at the expense of Austria, acquiring by the Treaty of Pressburg in 1805 approximately the boundaries it now has. The treaty also elevated the Bavarian duchy to the status of a kingdom, and its ruler, the elector Maximilian IV Joseph, became King Maximilian I. Externally the freedom of Bavaria continued to be restricted by the power of Napoleon—from July 1806 onward technically in his capacity as protector of the Confederation of the Rhine, which the new kingdom joined. Internally, however, full sovereignty provided the basis for the creation of a modern state. Traditional privileges were swept away, often ruthlessly, by the central bureaucracy. The reforms were anticlerical in spirit, and many monasteries were secularized. French pressure, moreover, helped to bring about equality before the law, universal liability to taxation, abolition of serfdom, liberty of conscience, and some individual constitutional safeguards proclaimed in the constitution of May 1, 1808.

In 1813, shortly before the Battle of Leipzig, Bavaria rejected Napoleon and in 1815 joined the Germanic Confederation against him. This timely switch of allegiance enabled Bavaria to emerge from the Congress of Vienna (1814–15) with much of its territorial and political gains intact, making it the third largest German state after Austria and Prussia.

Maximilian's subsequent reign saw the proclamation of a new constitution, on May 26, 1818. The parliament was to consist of two houses, with the lower house elected on a very narrow franchise. Religious equality and the rights of Protestants were guaranteed. The parliament was hardly opened before the doctrinaire radicalism of some of its members so alarmed the king that he considered taking repressive measures, but the parliament gradually moderated its tone, and Maximilian ruled until his death as a model constitutional monarch.

Under the reign of Maximilian's son, Louis I (reigned 1825–48), municipal autonomy and other reforms were undertaken. But Louis' infatuation with an Irish adventuress, Lola Montez, eventually made his position untenable and forced him to abdicate in 1848. In 1850 Louis' son and successor, Maximilian II (reigned 1848–64), brought Bavaria into an alliance with Saxony, Hanover, and Württemberg in accordance with the aim of establishing the medium-sized states in Germany—of which Bavaria was the largest—as a third force to counter the preponderance of Austria and Prussia. Bavaria subsequently tended to support Austria against Prussia. Maximilian's

successor, Louis II (reigned 1864–86), refused the Prussian chancellor Otto von Bismarck's proposal to incorporate Bavaria into a German domain under Prussian leadership, and Bavaria sided with Austria in the Prussian-Austrian War of 1866. But the quick victory of the Prussians and the moderation of their policies toward Bavaria led that kingdom to join Prussia in the Franco-German War of 1870 and afterward to share in the establishment of a German Empire under William I, king of Prussia.

Under the German constitution of 1871, Bavaria received a larger measure of independence than any of the other constituent states of the German Empire. Bavaria retained an autonomous diplomatic service, military administration, postal and telegraph service, and railways. Meanwhile, Louis II had begun showing signs of mental instability, and his extravagant building projects (notably the castle at Neuschwanstein) had drained the Bavarian treasury. In 1886 Louis II was declared insane, and the throne then passed to his brother Otto, who was also insane. Otto's uncle Luitpold became regent that same year, and, when Luitpold died in 1912, his son Louis III became king.

At the end of World War I an Independent Socialist, Kurt Eisner, deposed the Wittelsbach dynasty on the night of Nov. 7–8, 1918, and proclaimed Bavaria a republic. King Louis III fled, thus ending the rule of one of the oldest European dynasties. Eisner was assassinated in February 1919, and, in the subsequent chaos, revolutionary councils carried out a "Red Terror" and formed a short-lived soviet republic that ended in May 1919 when German army units and citizens' defense corps recaptured Munich and instituted a similarly ruthless "White Terror" against the communists. Under a new Bavarian constitution passed in August 1919, Bavaria became a parliamentary state in the Weimar Republic of postwar Germany. The Bavarian political scene remained unsettled, however, and in 1920 and 1921 there were unsuccessful right-wing coups. Adolf Hitler's National Socialist movement got its start in Munich, and in 1923 Hitler and General Erich Ludendorff attempted their unsuccessful putsch in that city. When the Nazis came to power in 1933, Bavaria, which had become the most conservative of all the German states, became a bastion of Nazism. The first Nazi concentration camp was built in March 1933 at Dachau, near Munich; and the fanatical Nürnberg Rallies, held annually from 1933 to 1938, gained worldwide notoriety.

After World War II Bavaria became part of the American occupation zone. The Palatinate was detached and joined to the new Rheinland-Pfalz state. Under the Basic Law (constitution) of West Germany of 1948, Bavaria became a *Land* of the Federal Republic. The Christian Social Union—the Bavarian counterpart of the national Christian Democrats and the successor of the old Bavarian People's Party—eventually became the leading party in Bavaria.

The land. Bavaria is a country of high plateaus and medium-sized mountains. In the northwest are the wooded sandstone hills of the Spessart; in the north are basalt knolls and high plateaus. The northwest is drained by the Main River, which flows into the Rhine. To the southeast, the topography varies from the stratified land formations of Swabia-Franconia to shell limestone and red marl, the hill country of the Franconian-Rednitz Basin, and the limestone mountains of the Franconian Jura along the Danube, which divides Bavaria north and south. On the eastern edge of Bavaria, adjoining the Czech Republic, is the Bohemian Forest and in the north the

Franconian Forest. South of the Danube is a plateau upon which lies the capital, Munich, and beyond it the Bavarian Alps. Bavaria's share of the Alps consists of wooded heights of several thousand feet, behind which rise steep ridges and high plateaus (in the west, the Allgäuer Alps; in the east, the Alps of Berchtesgaden). They reach their highest peak in the 9,718-foot (2,962-metre) Zugspitze in Germany's Wetterstein Range. Bavaria has a continental climate that is harsh for middle Europe, although there are some exceptions, such as the Lower Main valley.

The people. The southeast is inhabited by an old Bavarian stock, the southwest by people of Bavarian-Swabian descent, and the north by descendants of the Franks. Traditional differences are still visible in their villages. The Franks built large village clusters and laid out their farms in narrow strips. The houses are partly sandstone, partly half-timbered. Row houses with paved floors appear in some areas. In old Bavaria and Swabia there are both village clusters and one-street villages; most of the houses have wooden floors. The cities show even more marked differences. In the Swabian and, particularly, the Frankish areas, religious and secular landholders established a large number of towns, most of which remained small and were referred to as dwarf towns. These medieval towns were built compactly within protective walls. The churches, public buildings, and homes were lavishly decorated; the examples that remain are a constant delight to the tourist, notably in Rothenburg, Nördlingen, Dinkelsbühl, and sections of Nürnberg and Regensburg.

While the majority of Bavaria's inhabitants still live in small towns, about one-fifth live in towns of 100,000 or more. Munich is the third largest city in Germany and the largest city in Bavaria.

After World War II there was an influx of refugees from the Sudetenland and eastern Europe, where many Germans had lived for centuries. A significant proportion of Bavaria's population in the late 20th century was composed of these refugees. Beginning in the 1960s the industrial areas received large numbers of migrant workers from southern Europe.

Great changes took place in the religious composition of the population after the war, with a heavy influx of Protestants. In the late 20th century the vast majority of the Bavarians were Roman Catholics, having bishoprics in Munich-Freising, Augsburg, Regensburg, Passau, Bamberg, Eichstätt, and Würzburg. A substantial proportion were of Evangelical Lutheran faith, with centres in Munich, Augsburg, Regensburg, Nürnberg, Bayreuth, and Ansbach. The proportion of the population engaged in farming declined steadily since 1882, from a majority of the work force to less than one-fifth in the late 20th century. Industry and service sectors employ the largest number of workers.

The economy. More than half of the state's gross output in the late 20th century consisted of industrial and handicraft products. Trade, transportation, and services accounted for less than half, and agriculture and forestry for less than one-tenth.

Farms have grown larger and employ fewer hands. There has been a trend to specialization in crops and to production for specific markets. Most farms are family-operated. Small units are common, and there are a few large landholdings manned by foreign workers. Rye, wheat, and barley take up about half of the farmland; potatoes, sugar beets, and other vegetables another one-fourth; and the rest is given to hay, hops, and vineyards.

The development of Bavarian industry was at first hampered by a lack of minerals and poor transportation. The natural disadvan-

tages have been overcome by the development of hydroelectric power and more recently by the use of oil piped in from the Mediterranean ports of Marseille, Genoa, and Trieste. Improved transportation has encouraged industries that manufacture and finish quality products.

After World War II the government made efforts to attract industries, with the result that Bavaria attained a higher rate of industrial growth than the rest of Germany. In the late 20th century the leading industries were electronics, machinery, chemicals, textiles, automobiles, clothing, and foodstuffs; the range of industrial effort was too broad to give any industry a unique predominance.

Trade and commerce resemble that of the rest of Germany, with the exception of the tourist trade, which has assumed particular importance in the Bavarian Alps. Bavaria has several hundred thousand hotel beds, and most of them are in the Alpine area.

Begun in 1835, the Bavarian railroad system was heavily developed in the second half of the 19th century. All main lines either are

largely the Bavarian State Library in Munich. The Bavarian radio (broadcasting both radio and television programs) is a public, state-controlled system with headquarters in Munich. Area 27,241 square miles (70,554 square km). Pop. (1991 est.) 11,448,823.

Bavarian Alps, German *BAYERISCHE ALPEN*, northeastern segment of the Central Alps along the German-Austrian border. The mountains extend east-northeastward for 70 miles (110 km) from the Lechtaler Alps to the bend of the Inn River near Kufstein, Austria. Zugspitze (*q.v.*; 9,718 feet [2,962 m]) is the highest point in the range and in Germany. Subranges include the Wetterstein Range, Karwendel Range, and Nord Chain; the Austrian portion is also known as the North Tirol Limestone Alps. To the south the range's steep wall overlooks the Inn River valley, whereas to the north its gentle slopes allow the grazing of cattle. The mountains hold lignite mines and petroleum deposits and are crossed at Scharnitz Pass (3,133 feet [955 m]) by road and railway and at Achen Pass (3,087 feet [941 m]) by road. Tourism and winter sports are the

Neuschwanstein castle in the Bavarian Alps, built in the late 19th century

electrified or use diesel engines. The most important waterway is the Main River, which is navigable as far as Bamberg. The Danube carries vessels as far upstream as Kelheim. Bavaria has major airports at Munich-Riem and Nürnberg.

Government and social conditions. Bavaria is divided into seven administrative districts. Under its constitution of 1946, it is a free state with democratic parliamentary institutions. The voters are represented directly in a lower house, the Landtag, elected every four years. The Landtag chooses a minister-president and a cabinet. There is also a Senate composed of representatives of economic, social, cultural, and religious organizations.

The predominant political party in Bavaria since 1957 has been the Christian-Social Union (CSU). The other major parties are the Social Democratic Party and the Free Democratic Party.

The state government operates a system of primary, secondary, and vocational schools. Universities include several in Munich and one each in Erlangen-Nürnberg, Würzburg, Regensburg, Bayreuth, Passau, and Augsburg.

Cultural life. Folk arts and culture remain important in Bavaria, and traditional crafts continue to be practiced. Popular festivals occur throughout the year, the best known being Munich's Oktoberfest. Bavaria is also well known for its music and theatre. The annual Bayreuth Festival features the music of Richard Wagner. There are theatres in all the larger cities (including three state theatres in Munich alone), as well as numerous orchestras, opera companies, museums, and art galleries. The libraries are excellent, particu-

region's main activities. A large national park preserves the original Alpine landscape, plants, and animals from the steady encroachment of urbanization.

Bavarian cream, custard enriched with whipped cream and solidified with gelatin. Bavarian creams can be flavoured with chocolate, coffee, fruits, and the like and are usually molded in fancy shapes and garnished with fruits and sweet sauces. Its country of origin is either Bavaria or France.

Bavarian Forest, German *BAYERISCHER WALD*, mountain region in east-central Bavaria *Land* (state), southeastern Germany. The Bavarian Forest occupies the highlands between the Danube River valley and the Bohemian Forest along Bavaria's eastern frontier with the Czech Republic. Located largely in the *Regierungsbezirk* (administrative district) of Niederbayern (Lower Bavaria), the highlands parallel the southeasterly flowing Danube for about 90 miles (145 km) from the Cham and lower Regen rivers to the Austrian border east of Passau.

The Bavarian Forest, occupying mainly granite and gneiss hills, is divided into two sections by a sharp quartz ridge known as the Pfahl. The ridge runs roughly along the Regen valley and ranges from 65 to 100 feet (20 to 30 m) in height. The Vorderer Forest, or Danube Hills, a rolling plateau situated to the southwest between the Danube and the Pfahl, seldom rises more than 3,300 feet (1,000 m) above sea level. Meadow, isolated farmsteads, and small hamlets dominate the landscape; only the higher and steeper slopes are still wooded. Northeast of the Pfahl is the

Hinterer Forest, a higher and almost continuously forested mountain region where human settlement is confined to a few longitudinal valleys. Its highest peaks include the Grosser Arber, with an elevation of 4,777 feet (1,456 m), and the Rachel, Lusen, Dreisselberg, and Grosser Falkenstein.

The climate of the highlands is severe and wet, supporting only modest yields of rye, oats, and potatoes produced on small valley farms. Coniferous forest predominates, with spruce the main species at higher altitudes and a mixed woodland of spruce, silver fir, and beech found at lower levels. Lumbering, woodworking, and glass grinding are the principal industries. The tourist trade is expanding as the reputation of the Bavarian Forest as a beautiful and uncrowded holiday resort area spreads. Each year many visitors explore the Bavarian Forest National Park, where more than 98 percent of the park's 50.5-square-mile (130.8-square-kilometre) area is tree-covered and many species of plants, birds, and small animals thrive. Principal towns of the mountain region are Regen, Zwiesel, Waldkirchen, and Grafenau.

Bavarian State Picture Galleries, German *BAYERISCHE STAATSGEMÄLDESAMMLUNGEN*, in Munich, museum composed of several collections, the major ones being the Neue Pinakothek, the Alte Pinakothek, and the Schack Gallery. It also embraces, however, the State Gallery of Modern Art, the Olaf Gulbransson Museum in Kurpark, the State Gallery in Neuen Schloss Schleissheim bei München, the Division for Restoration and Scientific Research, and subsidiary galleries in a dozen cities throughout Germany.

The Neue Pinakothek (New Pinakothek), based on private picture collections of the Bavarian kings, is a collection noted for its works of European painting from the 18th through the 20th century and for its sculpture of the 19th–20th centuries. It is housed with the New State Gallery in the House of Art, which was built in 1933–37.

The Alte Pinakothek (Old Pinakothek) is a museum specializing in European painting from the Middle Ages through the late 18th century. Its collection derives from accumulations made by several early electors palatine of Bavaria. The building in which it is now housed is a reconstruction of the 19th-century gallery, by Leo von Klenze, which was destroyed in World War II. It opened in 1957.

The Schack Gallery collection of 19th-century, late Romantic German painting was acquired by the state in 1940 and represents the private collection of Count Adolf Friedrich von Schack. It is housed in the former Prussian Embassy, built in 1907–09.

Bavarian Succession, War of the (1778–79), conflict in which Frederick II the Great of Prussia blocked an attempt by Joseph II of Austria to acquire Bavaria.

After losing Silesia to the Prussians, the Austrian emperor Joseph II and his chancellor Wenzel Anton, Prince von Kaunitz, wished to acquire Bavaria in order to restore Austria's position in Germany. When the Bavarian electoral line of the Wittelsbachs failed on the death of Maximilian Joseph on Dec. 30, 1777, a treaty was signed with his successor, Charles Theodore, the elector palatine, ceding Lower Bavaria and the lordship of Mindelheim to Austria. However, Frederick II of Prussia declared war on July 3, 1778, in support of the claims to Bavaria made by Charles, duke of Zweibrücken. Austria's ally France refused to give aid, and Frederick with Saxony as his ally entered Bohemia, where he was opposed by an imperial army led by the emperor himself. There was little fighting, be-

cause each force was concerned with cutting its opponent's communications and denying it supplies. Hence contemporaries nicknamed the war the "potato war" (*Kartoffelkrieg*).

Maria Theresa, whose consent to the occupation of Bavaria had been given very unwillingly, made peace proposals to Frederick II against Joseph II's wishes. With France and Russia acting as intermediaries between Austria and Prussia, the representatives of the two powers met at Teschen on March 10, 1779. On May 13, 1779, they reached an agreement whereby Austria was to receive the Inn district, a fraction of the territory originally occupied.

Bavel (city): see *Babylon*.

Bävend DYNASTY: see *Bävand dynasty*.

Bavli, David ha-: see *Mukammas, David al-*.

bawu, Chinese single free-reed wind instrument, an aerophone particularly popular in southwestern China. It is played in a manner similar to that of playing the flute except that all the air passes through a single, pointed reed at the mouth hole. The tone produced is a result of the coupling between the reed and the air column. The common F *bawu* has the lowest pitch and spans a compass of more than two octaves.

Bawu performance is characterized by colourful tonal contrast, glissandos, various tonguing and fingering techniques, and circular breathing.

Bax, Sir Arnold (Edward Trevor) (b. Nov. 8, 1883, London—d. Oct. 3, 1953, Cork, County Cork, Ire.), British composer whose work is representative of the neoromantic trend in music that occurred between World Wars I and II.

In 1900 he entered the Royal Academy of Music where he studied the piano. Influenced by the Celtic Revival and Irish poetry, he wrote in 1909 the symphonic poem *In the Faëry Hills*. He spent the year 1910 in Russia. During the following years, under the pseudonym Dermot O'Byrne he published

Bax, pen-and-ink drawing by P. Evans; in the National Portrait Gallery, London

short stories and poems in Ireland, where he spent much time. In 1916 and 1917 he wrote three symphonic poems, *The Garden of Fand*, *Tintagel*, and *November Woods*, which established his reputation. His ballet, *The Truth About the Russian Dancers*, on a scenario by the playwright J.M. Barrie, was produced by Sergey Diaghilev in 1920. Between 1921 and 1939 he wrote seven symphonies dedicated to the musicians he admired, among them John Ireland and Jean Sibelius. He also wrote numerous piano and chamber works, including a sonata for viola and harp (1928) and a nonet for winds, strings, and harp (1931). Living for long periods on the coasts of Ireland and Scotland, he wrote music that was romantically evocative and richly orchestrated. He was knighted in 1937 and in 1941 was appointed Master of the King's Musick.

Baxter, Andrew (b. 1686/87, Aberdeen, Scot.—d. April 23, 1750, Whittinghame,

East Lothian), Scottish metaphysical rationalist who maintained the essential distinction between matter and spirit, resisting the more advanced British epistemology of his century.

Having gone to Utrecht in the Netherlands as tutor to two young gentlemen in 1741, he went on an excursion to Spain in 1745 and there met the English political radical John Wilkes, for whose intellect he conceived a fervent admiration subsequently expressed in a number of letters.

Baxter published anonymously *An Enquiry Into the Nature of the Human Soul* (1733; 3rd ed., 1745; Appendix, 1750) and *Matho, sive cosmotheoria puerilis* (1738), a compendium of scientific knowledge. *The Evidence of Reason in Proof of the Immortality of the Soul* (1779) was edited from his papers by John Duncan.

Baxter, George (b. July 31, 1804, Lewes, Sussex, Eng.—d. Jan. 11, 1867, Sydenham, Kent), English engraver and printer who invented a process (patented 1835) of colour printing that made reproductions of paintings available on a mass scale.

George Baxter, detail of a pencil drawing by an unknown artist

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co Ltd

He was the son of John Baxter (1781–1858), printer and publisher at Lewes, who issued the popular illustrated "Baxter" Bible. George Baxter went to London in 1827. There he supplied colour illustrations to the publisher George Mudie and produced prints for the London Missionary Society. Although he sold his work to several highborn clients and was even summoned to visit Queen Victoria, he had little business sense and did not profit greatly from his invention, partly because he encountered competition from cheap coloured lithographs. Baxter used carefully etched plates, a handpress, a system of register points, and the finest colours, oils, and paper. He mixed the colours himself but left no record of their composition.

Baxter, James K(eir) (b. June 29, 1926, Dunedin, N.Z.—d. Oct. 22, 1972, Auckland), poet whose mastery of versification and striking imagery made him a central figure among New Zealand writers after World War II.

Educated in New Zealand and England, he first published *Beyond the Palisade* (1944), which displayed youthful promise. *Blow, Wind of Fruitfulness* (1948), superficially a less attractive collection, was more profound. *Recent Trends in New Zealand Poetry* (1951) was his first critical work, its judgments revealing a maturity beyond his years. Later verse collections include *The Fallen House* (1953), the satirical *Iron Breadboard* (1957), and *Pig Island Letters* (1968). He also published *Aspects of Poetry in New Zealand* (1968).

Baxter, Richard (b. Nov. 12, 1615, Rowton, Shropshire, Eng.—d. Dec. 8, 1691, London), Puritan minister who influenced 17th-century English Protestantism. Known as a peace-

maker who sought unity among the clashing Protestant denominations, he was the centre of nearly every major controversy in England in his fractious age.

Baxter was ordained into the Church of England in 1638 after studying divinity. Within two years, however, he had allied himself with

Richard Baxter, detail from an oil painting after R. White, 1670; in the National Portrait Gallery, London

Puritans in opposition to the episcopacy established by his church. During his ministry at Kidderminster (1641–60) he made that Worcestershire town of handloom workers into a model parish. He preached in a church enlarged to accommodate the crowds that he drew. Pastoral counseling was as important to him as preaching, and his program for his parish came to serve as a pattern for many other ministers in the Church of England.

A believer in limited monarchy, Baxter attempted to play an ameliorative role during the English Civil Wars. He served briefly as a chaplain in the parliamentary army but then helped to bring about the restoration of the king (1660). After the monarchy was reestablished, he fought for toleration of moderate dissent within the Church of England. He was persecuted for his views for more than 20 years and was imprisoned (1685) for 18 months. The Revolution of 1688, replacing James II with William and Mary, brought in its wake an Act of Toleration that freed Baxter from most of the encumbrances he suffered for his opinions.

Among his more than 200 works are devotional manuals, pastoral handbooks, and such highly controversial doctrinal writings as *Aphorismes of Justification* (1649). His best-known works are *The Saints' Everlasting Rest* (1650) and *The Reformed Pastor* (1656). His autobiographical *Reliquiae Baxterianae, or Mr. Richard Baxter's Narrative of the Most Memorable Passages of His Life and Times* (1696), still of interest, gives an account of his inner spiritual struggles.

bay (title): see *bay*.

bay, concavity of a coastline or reentrant of the sea, formed by the movements of either the sea or a lake. The difference between a bay and a gulf is not clearly defined, but the term bay usually refers to a body of water somewhat smaller than a gulf. Numerous exceptions, however, are found throughout the world, such as the Bay of Bengal, larger than the Gulf of Mexico and about the same size as the Arabian Sea.

A brief treatment of bays follows. For full treatment, see *MACROPAEDIA: Oceans*.

A bay is usually located where more easily eroded rocks, such as clays and sandstones, are bounded by harder and more resistant formations made from igneous rocks, such as granite, or hard calcareous rocks, such as massive limestones, which are more resistant to the erosional forces of the land and sea

or lake. The harder rocks therefore stand out as promontories projecting out to sea, often with caves that may in some cases link the two sides of the promontory, thus creating an island, perhaps with a natural bridge to the mainland. This bridge will later fall as a result of erosion and weathering and leave an island completely separated from the mainland.

The softer rocks between the promontories are subjected to more rapid erosion as lines of waves, originally moving at an angle to the coastline, are turned more parallel to the coast by the shallower waters immediately offshore, so that the end of the line of waves closest to shore moves forward more slowly than the end farther out to sea. In this way the lines of waves gradually turn as they move around the windward headland to sweep directly onshore in the bay. The erosion of the soft rocks of the bay is most rapid during storms, when material eroded just behind the line of breakers is thrown by the waves farther up the beach; in this way a series of ridges may mark a succession of storms, particularly where the beach material is mainly pebbles. The wind may then carry the finest beach material inland beyond the high-water mark, where it may be deposited in a zone of sand dunes. These may, if uncontrolled, move miles inland. The most common method of dune stabilization is the encouragement of deep-rooted marram grass.

There are no defined dimensions for bays. Smaller bays may be only a few hundred metres wide, while others, such as the Bay of Biscay off Spain and France and Hudson Bay in Canada, are several hundred kilometres from side to side. Some of these larger bays may represent depressions in the ground, formed by vertical earth movements or glacial erosion by ice sheets. Hudson Bay is of this type. All bays are semicircular or nearly circular in shape, which distinguishes them from estuaries, which are elongated and funnel-shaped with a river running along the centre line and with beaches mainly near the mouth of the estuary. Estuaries and some of the more enclosed and sheltered bays form excellent harbours, provided that the seabed is deep enough and well-scoured. They were popular sites for early settlements, and a number of the larger coastal cities today have their original cores around a bay that provided protection for ships at anchor.

bay, in architecture, any division of a building between vertical lines or planes, especially the entire space included between two adjacent supports; thus, the space between two columns, or pilasters, or from pier to pier in a

The area of a bay indicated in a reconstruction of a Gothic vault, from *Le Premier Tome de l'architecture de Philibert de l'Orme* (1567), by Philibert Delorme

church, including that part of the vaulting or ceiling between them, is known as a bay.

Bay, Laguna de, lake, the largest inland body of water in the Philippines, on Luzon just southeast of Manila. Probably a former arm or extension of Manila Bay cut off by volcanism, Laguna de Bay (Spanish: "Lake of the Bay") has a normal area of about 356 square miles (922 square km) and is about 32 miles (51 km) long. Its shallow, crescent-shaped basin is poorly drained by many small streams, and the surrounding low-lying plains are inundated during seasons of heavy rainfall. The Pasig River is the lake's outlet to Manila Bay, 10 miles (16 km) northwest. An important fishing area, with productive wet margins (rice), Laguna de Bay is broken by two peninsulas in the north and dotted by islands; densely settled Talim (9 miles [14 km] long) is the largest. Santa Cruz, Biñan, and Calamba are towns on the lake's southern shore.

Bay, Michel de: see *Baius, Michael*.

Bay Bridge, in full *SAN FRANCISCO-OAKLAND BAY BRIDGE*, complex crossing that spans San Francisco Bay from the city of San Francisco to Oakland via Yerba Buena Island. One of the preeminent engineering feats of the 20th century, it was built during the 1930s under the direction of C.H. Purcell. The double-deck crossing extends 8 miles (13 km) and consists of two end-to-end suspension bridges of 2,310-foot (704-metre) main spans and 1,160-foot (354-metre) side spans; an exceptionally large-bore tunnel through Yerba Buena Island that extends about 0.5 mile (about 800 m); a cantilever bridge with a

Bay Bridge with San Francisco skyline

Ewing Galloway

main span of 1,400 feet (427 m); and a long viaduct to the Oakland shore. The greatest challenge in the construction of Bay Bridge was the sinking to bedrock (some 265 feet [81 m]) of the central anchorage for the two suspension bridges. This feat was accomplished by use of a multiple-dome caisson invented by Daniel Moran. A section of the Bay Bridge's upper deck collapsed during an earthquake that struck the San Francisco area on Oct. 17, 1989, requiring lengthy repair.

Bay City, city, seat (1857) of Bay county, east-central Michigan, U.S. It lies along the Saginaw River near the latter's juncture with Saginaw Bay (Lake Huron), 13 miles (21 km) north of Saginaw. Settled in the 1830s, it was formed in 1857 after a series of consolidations of five villages, culminating in 1905 with the union of Bay City and West Bay City. The community thrived during the Michigan lumber boom (1850–90); but, when the local pine forests were depleted and the mills closed, it turned to soft-coal mining, commercial fishing, and beet-sugar refining. The city's economy is now geared toward both agriculture (potatoes, melons, and beets) and industry (notably the manufacture of power shovels, cement, auto and aircraft equipment, and petrochemicals). Shipbuilding is also important. With deepwater harbour facilities, it is a port for Great Lakes and ocean shipping. The city has several riverside parks, and along the bay shore lies amusement parks, bathing

beaches, and summer cottages. There are boating and fishing on the river and bay. Bay City State Park is 5 miles (8 km) north of the city. Inc. city, 1865. Pop. (2004 est.) 35,317; Bay City MSA, 109,480.

Bay Islands, Spanish *ISLAS DE LA BAHÍA*, group of small islands of northern Honduras. They have an area of 101 square miles (261 square km) and lie about 35 miles (56 km) offshore in the Caribbean Sea. The main islands were first sighted by Christopher Columbus in 1502 and were settled in 1642 by English buccaneers. Between 1650 and 1850 Spain, Honduras, and England intermittently contested the islands, and Carib Indians from St. Vincent in the Leeward Islands were deported to a penal colony on Roatán. The islands were annexed to Great Britain in 1852 but were ceded to Honduras in 1859. Roatán (*q.v.*), the chief settlement, is located on Roatán island. The chief activities are raising bananas, cassava, coconuts, sweet potatoes, and livestock and fishing. English-speaking Protestants constituted the majority of the islands' population until the late 20th century, when Spanish-speaking mainland Hondurans began settling there. Pop. (2001 prelim.) 38,073.

bay leaf, also called *LAUREL LEAF*, leaf of the sweet bay tree, *Laurus nobilis*, an evergreen of the family Lauraceae, indigenous to countries bordering the Mediterranean. A popular herb used in pickling and marinating and to flavour stews, stuffings, and fish, bay leaves are delicately fragrant but have a bitter taste. They contain approximately 2 percent essential oil, the principal component of which is cineole. The smooth and lustrous dried bay leaves are usually used whole and then removed from the dish after cooking; they are sometimes marketed in powdered form. Bay has been cultivated from ancient times; its leaves constituted the wreaths of laurel that crowned victorious athletes in ancient Greece. During the European Middle Ages bay leaves were used medicinally.

bay lynx: see bobcat.

Bay of ——— : see under substantive word (*e.g.*, Biscay, Bay of), except as below.

Bay of Pigs invasion (April 17, 1961), abortive invasion of Cuba at the Bay of Pigs (Bahía de los Cochinos), on the southwestern coast by some 1,500 Cuban exiles opposed to Fidel Castro. The invasion was financed and directed by the U.S. government.

Within six months of Castro's overthrow of Fulgencio Batista's dictatorship in Cuba (January 1959), relations between Castro's government and the United States began to deteriorate. The new Cuban government confiscated private property (much of it owned by North American interests), sent agents to initiate revolutions in several Latin-American countries, and established diplomatic and economic ties with leading socialist powers. Castro himself often and vociferously accused the United States of trying to undermine his government. Several U.S. congressmen and senators, from early 1960, denounced Castro; and by June the Congress had passed legislation enabling President Dwight D. Eisenhower to take retaliatory steps: the United States cut off sugar purchases from Cuba and soon thereafter placed an embargo on all exports to Cuba except food and medicine. In January 1961, Eisenhower, in one of the final acts of his administration, broke diplomatic ties with Cuba.

An invasion of Cuba had been planned by the U.S. Central Intelligence Agency (CIA) since May 1960. The wisdom of proceeding with the invasion had been debated within the newly inaugurated administration of President John F. Kennedy before it was finally approved and carried out.

On April 15, 1961, three U.S.-made airplanes

piloted by Cubans bombed Cuban air bases. Two days later the Cubans trained by the United States and using U.S. equipment landed at several sites. The principal landing took place at the Bay of Pigs on the south-central coast. The invasion force was unequal to the strength of Castro's troops, and by April 19 its last stronghold had been captured, along with more than 1,100 men. In the aftermath of the invasion, critics charged the CIA with supplying faulty information to the new president and also noted that, in spite of Kennedy's orders, supporters of Batista were included in the invasion force, whereas members of the non-communist People's Revolutionary Movement, considered the most capable anti-Castro group, were excluded.

The captured members of the invasion force were imprisoned. From May 1961 the Kennedy administration unofficially backed attempts to ransom the prisoners, but the efforts of the Tractors for Freedom Committee, headed by Eleanor Roosevelt, failed to raise the \$28,000,000 needed for heavy-construction equipment demanded by Castro as reparations. The conditions for the ransom changed several times during the next several months; after painstaking negotiations by James B. Donovan, Castro finally agreed to release the prisoners in exchange for \$53,000,000 worth of food and medicine. Between December 1962 and July 1965 the survivors were returned to the United States. Some critics thought that the United States had not been aggressive enough in its support of the Bay of Pigs invasion and had left an impression of irresolution. The incident was crucial to the development of the Cuban missile crisis of October 1962.

Bay of Plenty, local government region, eastern North Island, New Zealand. It encompasses the narrow 100-mile- (160-kilometre-) long lowlands fronting the Bay of Plenty and extends from Matakana Island eastward to Cape Runaway. The Rangitaiki, Whakatane, and Motu rivers drain northward into the bay. The local government region also extends inland (south) from the bay as much as 40 miles (64 km) to include much of the Volcanic Plateau that is the heart of North Island's thermal belt. The city of Rotorua, about 30 miles (48 km) inland on the Volcanic Plateau, is noted for the geysers, fumaroles, boiling mud, and warm mineral bathing pools in its vicinity. Other principal settlements in the region include Mount Maunganui, Tauranga, Make-tu, Matata, Whakatane, and Te Puke. Dairy and sheep farming predominate. Pop. (2005 est.) 260,300.

bay owl (species *Phodilus badius*), uncommon and atypical Asian owl of the family Phodilidae (order Strigiformes) with a heart-

Bay owl (*Phodilus badius*)

Kenneth W. Fink—Photo Researchers, Inc.

shaped facial disk having two earlike extensions dorsally that aid sound reception. Bay owls are sometimes classified with the barn owls (Tytonidae) and sometimes with the typical owls (Strigidae). The bay owl, which is found in Southeast Asia, is entirely nocturnal and retiring. The Congo bay owl of Africa, which is sometimes classified as a separate species, is even less well known. Bay owls eat insects, lizards, frogs, and small mammals and birds.

Bay Psalm Book, byname of *THE WHOLE BOOKE OF PSALMES FAITHFULLY TRANSLATED INTO ENGLISH METRE* (1640), perhaps the oldest book now in existence that was published in British North America. It was prepared by Puritan leaders of the Massachusetts Bay Colony. Printed in Cambridge, Mass., on a press set up by Stephen Day (*q.v.*), it included a dissertation on the lawfulness and necessity of singing psalms in church.

Bay Saint Louis, city, seat (1860) of Hancock county, south-central Mississippi, U.S. It lies along the Mississippi Sound at the entrance to St. Louis Bay, 58 miles (93 km) northeast of New Orleans. The site was part of a 1789 Spanish land grant to Thomas Shields. The village soon became a resort for wealthy planters and, later, for tourists who arrived after the New Orleans, Mobile and Chattanooga Railroad was completed in 1869.

The town was incorporated as Shieldsborough in 1818 and as the city of Bay Saint Louis in 1882. During the War of 1812, the bay was the scene (1814) of the naval engagement known as the Battle of Pass Christian. In the late 20th century, casino gambling and tourism fueled the city's growth. Bay Saint Louis, along with most of Hancock county, sustained severe storm damage in 2005 from Hurricane Katrina; the neighbouring city of Waveland was virtually razed. The John C. Stennis Space Center is about 15 miles (24 km) west. Pop. (2004 est.) 8,293.

bay tree, any of several small trees with aromatic leaves, especially the sweet bay, or bay laurel (*Laurus nobilis*), source of the bay leaf (*q.v.*) used in cooking. The California laurel (*q.v.*; *Umbellularia californica*) is an ornamental tree also called the bay tree. The bay rum tree, or simply bay (*Pimenta racemosa*), has leaves and twigs that yield, when distilled, oil of bay, which is used in perfumery and in the preparation of bay rum.

bay window, window formed as the exterior expression of a bay within a structure, a bay in this context being an interior recess made by the outward projection of a wall. The purpose of a bay window is to admit more light than would a window flush with the wall line.

A bay window may be rectangular, polygonal, or arc-shaped. If the last, it may be called a bow window. There has been a continuing confusion between bay and bow windows. Bay window is the older term and has become the generic form. A bay window is also called an oriel, or oriel window, when it projects from an upper story and is supported by corbels.

Bay windows are associated historically with mansions of the early English Renaissance. They are characteristically employed at the end of a great hall opposite the entrance and behind the raised dais on which the lord of the manor was served. In modern architecture the bay window emerged as a prominent feature of the Chicago School. The utilitarian program of William Le Baron Jenney, one goal of which was maximum admission of natural light, resulted in the creation of the cellular wall and a new emphasis on bay windows. An interesting example is Jenney's Manhattan Building (Chicago, 1890), which displays both polygonal bay windows and bow windows.

Baya, also spelled GBAYA, or GBEYA, a people of southwestern Central African Republic, east-central Cameroon, northern Congo, and northwestern Zaïre. Numbering about 820,000 in the late 20th century, they speak a language of the Adamawa-Eastern subgroup of the Niger-Congo family that is related to those of their Banda and Nbandi neighbours.

Baya migrated southeastward from what is now the Hausa area of northern Nigeria early in the 19th century, fleeing the jihad (holy war) of Usman dan Fodio. The Baya, who were led by a war chief, Gazargamu, vanquished and assimilated or drove ahead of them the peoples that they encountered. Contemporary Baya subgroups, which include the Bokoto, Kara, Buli, Kaka, and Bwaka, reflect this integration of defeated peoples. The Baya, in turn, were attacked annually by Fulani slavers from what is now northern Cameroon.

The Baya resisted French forces throughout the colonial period. They revolted in the early 1920s because of the brutal impressment of Baya men and women as porters and labourers. In 1928 the Baya began what became a three-year revolt in response to conscription for the Congo-Ocean Railway; a French "nightmare campaign" decimated the rebellious Baya to an extent that was still evident for several decades.

The Baya observed patrilineal descent and traditionally had a stateless society. In the past, war chiefs were selected only in times of crisis and were divested of their powers thereafter. Baya village chiefs were arbiters and symbolic leaders, but they were later made into administrative magistrates by the French colonizers. Baya clans were the primary identity group within which marriage, religious ceremonies, and trade with outsiders (e.g., Arab caravaners) was regulated. Age groups called *labi* cut across clan identities and further assured solidarity in times of war; initiates received training in agricultural, social, and religious knowledge and skills.

Rural Baya grow corn (maize), cassava, yams, peanuts (groundnuts), and tobacco. They also hunt and fish. Coffee and rice, introduced by the French, are cash crops. The diamond rush of the late 1930s greatly disrupted traditional life of Baya in some regions; diamond prospecting continues to be economically important.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Bayamo, city, capital of Granma provincia, eastern Cuba. Lying on the Bayamo River, it was founded as San Salvador de Bayamo in 1513. In colonial times it was one of Cuba's most important cities, and it has been the scene of several uprisings, including the independence movement of 1895. It is now an important manufacturing, commercial, and transportation centre for the surrounding countryside, in which cattle raising is widespread and the dairy and tanning industries are well-developed; copper and manganese are mined in the area. Sugar, rice, coffee, and tobacco also are processed in the city, and tiles are manufactured. Bayamo is a railroad junction and lies on the central highway; it also has an airfield. Pop. (1986 est.) 105,302.

Bayamón, town, northeastern Puerto Rico, part of the metropolitan area of San Juan, 10 miles (16 km) northeast. Puerto Rico's first settlement, Caparra, was founded in the area in 1508 by the Spanish explorer Juan Ponce de León. Bayamón was established as a town in 1772. It manufactures clothing, furniture,

automotive parts, metal products, firearms, household goods, and food products. Bayamón Central University was founded in 1961, and the town has a regional college of the University of Puerto Rico. It is linked to San Juan by a freeway and is on the main highway to Arecibo. The statesman José Celso Barbosa (1857–1921) was born there. Pop. (1980) 185,087.

Bayan (fl. 14th century, China), powerful Mongol minister in the last years of the Yüan (Mongol) dynasty of China. His anti-Chinese policies heightened discontent among the Chinese, especially the educated, and resulted in widespread rebellion.

In the early years of the reign (1333–68) of the emperor Togön Temür (*q.v.*), Bayan assumed almost complete control of the government, the emperor being uninterested in affairs of state. Bayan's desire was to stop the absorption of the Mongols into Chinese culture and buttress their declining power within China. He suspended the civil service examinations and decreed that only Mongols could hold offices. He issued a number of other proscriptions making it illegal for Chinese to learn to read either Mongol or Arabic script, to wear certain colours, and to use certain ideographs, including those for "long life" and "happiness." Finally he proposed that all Chinese with the surnames Chang, Wang, Liu, Li, and Chao be executed. Since these were among the most common family names in China, the carrying out of this order would have caused the extermination of 90 percent of the population. Although this last proposal was not adopted, rebellions broke out repeatedly, and Bayan was finally deposed and banished by his nephew in 1339. It was possible to reverse his policies, but the deterioration of the dynasty had become irreversible. It was supplanted by the Ming in 1368.

Bayan Tumen (Mongolia): *see* Choybalsan.

Bayar, (Mahmud) Celâl (b. May 15, 1882/83, Umurbey, near Bursa, Ottoman Empire [now in Turkey]—d. Aug. 22, 1986, Istanbul), third president of the Turkish Republic (1950–60), who initiated etatism, or a state-directed economy, in Turkey in the 1930s and who after 1946, as the leader of the Democrat Party, advocated a policy of private enterprise.

The son of a mufti (Muslim jurist), Bayar attended a French school operated by the Alliance Israélite Universelle in Bursa, where he studied economics and finance. He then worked for the Bursa branch of the Deutsche Orient Bank. After the Young Turk Revolution of 1908, he became the secretary of the Smyrna branch of the Committee of Union and Progress directed against Sultan Abdülhamid's autocratic rule. Following the collapse of the Ottoman Empire at the end of World War I, he joined the movement of Mustafa Kemal (later Atatürk) to resist the Allied occupation of Anatolia, organizing the national forces in the Smyrna and Bursa regions in western Anatolia. In January 1920 he was elected to the last Ottoman Parliament as deputy for Smyrna; when the Parliament was suppressed and the British arrested the nationalists, he escaped to Ankara, where Mustafa Kemal had convened the Grand National Assembly (GNA). Bayar served as minister of economy (1921–22) in the government of the GNA and for a time (1922–24) as minister of reconstruction and settlement for the new Turkish Republic. He resigned to form the İş (Work) Bank.

In 1932 Bayar, an exponent of a state-operated economy, became the minister of economy and contributed to the development of Turkey's industries and mines. In 1937 he became prime minister but resigned in January 1939 after Atatürk's death.

In 1945 Bayar resigned from Parliament and also from the Republican People's Party

of Atatürk. In January 1946, with Adnan Menderes, Mehmed Fuad Köprülü, and Refik Koraltan, he helped organize the opposition Democrat Party, which won 62 seats in the general election of July 1946. Under Bayar's leadership the party won an overwhelming victory at the election of May 14, 1950, and he was elected president by the new Parliament. He was twice reelected (1954, 1957). Bayar was the architect of the government's economic policy, which gave priority to private enterprise and limited the state's functions to regulating and coordinating the forces participating in the economy.

Arrested during the military coup d'état of May 27, 1960, he was subsequently tried, along with other leaders of the Democrat Party, on dubious charges of crimes against the state and was sentenced to death (September 1961). Because of his advanced age, however, the sentence was commuted to life imprisonment. Released for reasons of health in 1964, he began publication of his memoirs, entitled *Ben de yazdım* ("I, Too, Have Written"). He was pardoned in 1966.

Bayard, Pierre Terrail, seigneur de (lord of) (b. c. 1473, Château Bayard, near Pontcharra, Fr.—d. April 30, 1524, Italy), French soldier known as *le chevalier sans peur et sans reproche* ("the knight without fear and without reproach").

The chevalier Bayard, engraving by P. Mariette, 16th century

By courtesy of the Bibliotheque Nationale, Paris

Bayard was born into a noble family, nearly every head of which for two centuries past had fallen in battle. He accompanied King Charles VIII of France into Italy in 1494 and was knighted after the Battle of Fornovo (1495). In Louis XII's wars he was the hero of numerous combats; he was wounded at the assault on Canossa and was the hero of a celebrated combat of 11 French knights against an equal number of Spanish ones. On one occasion he is said to have defended a bridge over the Garigliano single-handed against about 200 Spanish troops, an exploit that brought him such renown that Pope Julius II sought unsuccessfully to entice him into the papal service. In 1508 he distinguished himself again at the siege of Genoa and, later, at the siege of Padua. Severely wounded at Brescia, he nevertheless hurried to join the Battle of Ravenna (1512).

On the accession of Francis I in 1515, Bayard was made lieutenant general of Dauphiné. When war broke out again between Francis I and the Holy Roman emperor Charles V, Bayard, with 1,000 men, held Mézières against an army of 35,000, and after six weeks he compelled the imperial generals to raise the siege. This stubborn resistance saved central France from invasion and gave Francis time

to collect the army that drove out the invaders (1521). In 1523 Bayard was sent to Italy with Guillaume de Bonnavet. The latter, who was defeated at Robecco and wounded during his retreat, implored Bayard to assume command. Guarding the rear at the passage of the Sesia, Bayard was mortally wounded by a harquebus ball. He died in the midst of the enemy. His body was restored to his friends and interred at Grenoble.

Bayard was one of the most skillful and professional commanders of the 16th century in Europe. He obtained complete information about the enemy's position and plans by reconnaissance and espionage, and in the midst of mercenary armies he remained absolutely disinterested in plunder. To his contemporaries he was the faultless knight—heroic, devout, generous, and kindly.

Bayard, Thomas Francis (b. Oct. 29, 1828, Wilmington, Del., U.S.—d. Sept. 28, 1898, Dedham, Mass.), American statesman, diplomat, and lawyer.

Bayard was a member of a distinguished family. He was directly descended from the French hero the Seigneur de Bayard and from Ann Bayard, a sister of the Dutch governor of New Amsterdam (New York) Peter Stuyvesant. His great-grandfather Richard Bassett (1745–1815) was governor of Delaware; his grandfather James Asheton Bayard (1767–1815) was a prominent Federalist congressman from Delaware and one of the U.S. commissioners who negotiated the Treaty of Ghent with Great Britain that ended the War of 1812; his uncle Richard Henry Bayard (1796–1868) was chief justice of Delaware; and his father, James Asheton Bayard (1799–1880), was a well-known constitutional lawyer. All of the foregoing represented Delaware in the U.S. Senate.

Bayard's formal education was limited to a few years in an academy in Flushing, N.Y. He did not attend college but in 1848 began the study of law in the office of his father and was admitted to the bar in 1851. He practiced chiefly in Wilmington and served for one year (1853–54) as U.S. attorney for Delaware, an office that his father had held some years earlier. During the sectional crisis of 1860–61 he was instrumental in keeping Delaware in the Union. He served in the U.S. Senate (1869–85), succeeding his father, and was secretary of state in the first administration of President Grover Cleveland (1885–89).

In 1893 Bayard was appointed ambassador to Great Britain, the first U.S. representative to Great Britain to hold that rank. As a champion of arbitration, he was critical of the aggressive position taken by Cleveland in the dispute with Great Britain over the Venezuelan boundary (1895). His critics thought him too pro-British, and he was censured by the U.S. House of Representatives.

Because of failing health, Bayard left London in 1897. His son, Thomas Francis Bayard (1868–1942), represented Delaware in the U.S. Senate in the 1920s.

Baybars I, in full AL-MALIK AẒ-ZĀHIR RUKN AD-DĪN BAYBARS AL-BUNDUQDĀRĪ, or AẒ-ŞĀLIḤĪ, Baybars also spelled BAIBARS (b. 1223, north of the Black Sea—d. July 1, 1277, Damascus, Syria), most eminent of the Mamlūk sultans of Egypt and Syria, which he ruled from 1260 to 1277. He is noted both for his military campaigns against Mongols and crusaders and for his internal administrative reforms. The *Sirat Baybars*, a folk account purporting to be his life story, is still popular in the Arabic-speaking world.

Baybars was born in the country of the Kipchak Turks on the northern shores of the Black Sea. After the Mongol invasion of their country in about 1242, Baybars was one of a number of Kipchak Turks sold as slaves. Turkish-speaking slaves, who had become the military backbone of most Islāmic states, were

highly prized, and eventually Baybars came into the possession of Sultan aṣ-Şāliḥ Najm ad-Dīn Ayyūb of the Ayyūbid dynasty of Egypt. Sent, like all the sultan's newly acquired slaves, for military training to an island in the Nile, Baybars demonstrated outstanding military abilities. Upon his graduation and emancipation, he was appointed commander of a group of the sultan's bodyguard.

Baybars gained his first major military victory as commander of the Ayyūbid army at the city of al-Manṣūrah in February 1250 against the crusaders' army led by Louis IX of France, who was captured and later released for a large ransom. Filled with a sense of their military strength and growing importance in Egypt, a group of Mamlūk officers, led by Baybars, in the same year murdered the new sultan, Tūrān Shāh. The death of the last Ayyūbid sultan was followed by a period of confusion that continued throughout the first years of the Mamlūk sultanate.

Having angered the first Mamlūk sultan, Aybak, Baybars fled with other Mamlūk leaders to Syria and stayed there until 1260, when they were welcomed back to Egypt by the third sultan, al-Muẓaffar Sayf ad-Dīn Quṭuz. He restored them to their place in the army and conferred a village upon Baybars.

Within a few months of Baybars' arrival, in September 1260, the Mamlūk troops defeated a Mongol army near Nābulus in Palestine. Baybars distinguished himself as the leader of the vanguard, and many Mongol leaders were slain on the field.

For his military achievement, Baybars expected to be rewarded with the town of Aleppo; but Sultan Quṭuz disappointed him. On the way home through Syria, Baybars approached Quṭuz and asked him for the gift of a captive Mongol girl. The sultan agreed, and Baybars kissed his hand. On this prearranged signal the Mamlūks fell upon Quṭuz, while Baybars stabbed him in the neck with a sword. Baybars seized the throne to become the fourth Mamlūk sultan.

Baybars' ambition was to emulate Saladin, the founder of the Ayyūbid dynasty, in the holy war against the crusaders in Syria. As soon as he was acknowledged as sultan, Baybars set about consolidating and strengthening his military position. He rebuilt all the Syrian citadels and fortresses that had been destroyed by the Mongols and built new arsenals, warships, and cargo vessels. To achieve unity of command against the crusaders, Baybars united Muslim Syria and Egypt into a single state. He seized three important towns from the Ayyūbid princes, thus ending their rule in Syria. From 1265 to 1271, Baybars conducted almost annual raids against the crusaders. In 1265 he received the surrender of Arsūf from the Knights Hospitalers. He occupied 'Atlit and Haifa, and in July 1266 he received the town of Safed from the Knights Templar garrison after a heavy siege. Two years later, Baybars turned toward Jaffa, which he captured without resistance. The most important town taken by Baybars was Antioch (May 1268). His seizure of additional strongholds in 1271 sealed the crusaders' fate; they were never able to recover from their territorial losses. Baybars' campaigns made possible the final victories won by his successors.

Baybars' permanent goal was to contain the continued Mongol attacks on Syria from both north and east that threatened the very heart of the Islāmic East. During the 17 years of his reign, he engaged the Mongols of Persia in nine battles. Within Syria, Baybars dealt with the Assassins, a fanatical Islāmic sect. After seizing their major strongholds between 1271 and 1273, he wiped out the Syrian members of the group.

Baybars also took the offensive against the Christian Armenians (who were allies of the Mongols), devastating their lands and plundering their major cities. In 1276, having

defeated the Seljuq troops and their Mongol allies, he personally seized Caesarea (modern Kayseri in Turkey) in Cappadocia. To secure Egypt on the south and west, Baybars sent military expeditions into Nubia and Libya, taking personal command in 15 campaigns and often endangering his life.

In the interest of good diplomatic relations with the Byzantine Empire, Baybars sent envoys to the court of Michael VIII Palaeologus in Constantinople. The Byzantine sovereign thereupon ordered the restoration of the ancient mosque and permitted the Egyptian merchants and ambassadors to sail through the Hellespont and Bosphorus. One of Baybars' principal goals during his reign was to acquire more Turkish slaves to be used in the Mamlūk army; another was to contract an alliance with the Mongols of the Golden Horde in South Russia against the Mongols of Persia. In 1261 Baybars sent an ambassador to the Sicilian king Manfred. Other embassies to Italy followed, and in 1264 Charles of Anjou, later king of Naples and Sicily, sent an embassy with letters and gifts to Cairo, a remarkable testimony to Baybars' strength and influence. Baybars was also able to sign commercial treaties with such distant sovereigns as James I of Aragon and Alfonso X of León and Castile.

In a brilliant political move Baybars invited a fugitive descendant of the 'Abbāsīd dynasty of Baghdad to Cairo and established him as caliph—head of the Muslim community—in 1261. Baybars wished to legitimize his sultanate and to give preeminence to his rule in the Muslim world. The 'Abbāsīd caliphs in Cairo had no practical power in the Mamlūk state, however.

Baybars was, moreover, more than a military leader or a diplomatic politician. He built canals, improved harbours, and established a regular and fast postal service between Cairo and Damascus, one that required only four days. He built the great mosque and the school bearing his name in Cairo. He was also the first ruler in Egypt to appoint chief justices representing the four main schools of Islāmic law.

A sportsman as well as a warrior, Baybars was fond of hunting, polo, jousting, and archery. He was also a strict Muslim, a generous almsgiver, and watchful of the morals of his subjects—he issued a prohibition against the use of wine in 1271.

He died in Damascus after drinking a cup of poison intended for someone else and was buried in Damascus under the dome of the present az-Zāhirīyah Library, which he had established. (H.Ra.)

BIBLIOGRAPHY. A short account of the life of Baybars by Ibn 'Abd al-Zāhir is included in Syedah F. Sadeque (ed.), *Baybars I of Egypt* (1956, reprinted 1980). See also S. Lane-Poole, *A History of Egypt in the Middle Ages*, pp. 242–275 (1901, reprinted 1968); and Abdul-Aziz Khawater, *Baibars the First: His Endeavours and Achievements* (1978).

bayberry, any of several aromatic shrubs and small trees of the genus *Myrica* in the bayberry family (Myricaceae), but especially *M. pennsylvanica*, also called candleberry, whose grayish waxy berries, upon boiling, yield the wax used in making bayberry candles. The California bayberry, or California wax myrtle (*M. californica*), is used as an ornamental on sandy soils in warm climates.

Bayḍā', Al-, also spelled BEIDHA, or BEIDA, town, in south-central Yemen. It is situated on a high plateau and, until the unification of the two Yemen states in 1990, was part of North Yemen (Ṣan'ā'), though it lay near the disputed frontier with South Yemen (Aden).

The town, formerly known as Bayḥān Umm Rusās, was the historic capital of the sultanate

of Bayhān (Beihan), which ruled over a wide area from the lifetime of Muḥammad (7th century AD) to the 16th century. In modern times, before delimitation of the frontier between North Yemen and South Yemen, the town and environs were considered to be part of the former British-controlled Aden Protectorate. On behalf of the protectorate, the British concluded a treaty (1934) with North Yemen, which provided that the frontier at the time of its signing should be accepted for a period of 40 years. Under the terms of this treaty, Al-Bayḍā' became part of North Yemen. There were frequent incursions from Al-Bayḍā' into territory claimed by successive governments based at Aden, because the status quo line had never been demarcated on the ground.

The area was not a traditional province of Yemen but was set up in 1949, primarily for political reasons. Teff, a cereal grain introduced into southern Arabia from Ethiopia, is produced in the area and marketed in the town; Al-Bayḍā' is also a horse-breeding centre. A road from Ṣan'ā' to Al-Bayḍā' was completed in 1979. Pop. (1994) 19,294.

Bayer, Friedrich (b. June 6, 1825, Barmen, Rhine province, Prussia [Germany]—d. May 6, 1880, Würzburg, Ger.), German businessman who founded the chemical firm that became the world-famous Bayer AG (*q.v.*).

Bayer served an apprenticeship with a firm dealing in chemical products, and he quickly advanced to become the deputy of the owner. He soon established his own business dealing in chemicals and dyewoods and took up the manufacture of dye extracts and dyestuffs. In 1863, together with Friedrich Weskott, Bayer founded a new firm producing triphenylmethane and azo dyestuffs and later also alizarin dyestuffs. At the time of his death, his business supplied chemicals and dyestuffs to textile firms throughout the world, and the foundation for Bayer AG was already laid. After his death the management of the firm was taken over by his son, Friedrich Bayer (1851–1920), and H.T. von Böttinger.

Bayer, Gizi: *see* Bajor, Gizi.

Bayer, Herbert (b. April 5, 1900, Haag, Austria—d. Sept. 30, 1985, Montecito, Calif., U.S.), German-American graphic artist, painter, and architect, influential in spreading European principles of advertising in the United States.

Bayer was first trained as an architect, but from 1921 to 1923 he studied typography and mural painting at the Bauhaus, then Germany's most advanced school of design. After

Herbert Bayer in his studio, 1969

Hans Graff Photo

spending a year (1923) as a house painter, he became a master of typography and advertising at the Bauhaus and simultaneously was an art director with *Vogue*, an American fashion magazine. In 1928 he moved to Berlin, where he worked in advertising, painting, exhibition design, typography, and photography until 1938, when he moved to New York City

and concentrated on advertising design. He became an American citizen in 1943.

In 1946 Bayer became chairman of the department of design of the Container Corporation of America and design consultant for Aspen Development, a corporation that stages an annual festival of the arts in Aspen, Colo. In the latter capacity he designed many architectural projects, such as the Aspen Institute for Humanistic Studies (1962) and the Music Tent (1965) used during the annual festival. He also experimented in environmental sculpture (*e.g.*, "Marble Garden" [1955] and "Beyond the Wall" [1976]) while continuing his work in painting ("White Moon and Structure" [1959]) and the graphic arts. He received a gold medal from the American Institute of Graphic Arts in 1970.

Bayer, Johann (b. 1572, Rain, Bavaria [Germany]—d. March 7, 1625, Augsburg [Germany]), German astronomer whose book *Uranometria* (1603) promulgated a system of identifying all stars visible to the naked eye.

Bayer entered Ingolstadt University in 1592 to study philosophy and later moved to Augsburg. He became a lawyer by profession but, like many of his time, took a curious interest in the new advances in astronomy, leading to his publication of *Uranometria*, a popular guide to the constellations. In 1612 he was appointed legal adviser to the city council of Augsburg.

Before Bayer's work, star charts were based on Ptolemy's star catalog, which was incomplete and ambiguous. Bayer updated Ptolemy's list of 48 constellations, adding 12 constellations newly recognized in the Southern Hemisphere. Based upon Tycho Brahe's determinations of stellar positions and magnitudes, Bayer assigned each visible star in a constellation one of the 24 Greek letters. For constellations with more than 24 visible stars, Bayer completed his listing with Latin letters. The nomenclature that Bayer developed is still used today and has been extended to apply to about 1,300 stars.

Bayer AG, German chemical and pharmaceutical company founded in 1863 by a chemical salesman, Friedrich Bayer (1825–80), and Johann Friedrich Weskott (1821–76), who owned a dye company. Company headquarters, originally in Barmen (now Wuppertal), have been in Leverkusen, Ger., north of Cologne, since 1912.

The company was originally called Friedr. Bayer et comp., and it manufactured dyestuffs; in 1881 it was incorporated as Farbenfabriken vormals Friedr. Bayer & Co. In 1899 the company introduced aspirin, which was the chance invention of Bayer chemist Felix Hoffmann (1868–1946). In 1912 Carl Duisberg (1861–1935), a chemist, became Bayer's general director and soon was a leading force in the movement that by 1925 resulted in the consolidation of Germany's chemical industries as IG Farben; Duisberg became IG Farben's first chairman, and Bayer remained within the cartel until it was dissolved by the Allies in 1945 following World War II. In 1951 an independent Bayer was reestablished as Farbenfabriken Bayer Aktiengesellschaft; the company's current name was adopted in 1972.

The company's trademark, the Bayer cross, is internationally recognized. Scores of pharmaceuticals, dyes, acetates, synthetic rubbers, plastics, fibres, insecticides, and other chemicals were first developed by Bayer. In addition to being the originator and marketer of aspirin (1899), Bayer also introduced the first sulfa drug, Prontosil (1935), and polyurethane (1937), a base material for synthetic foams, paints, adhesives, fibres, and other goods.

Bayerische Motoren Werke AG (BMW), German automaker noted for quality sports sedans and motorcycles. It originated in 1916 as Bayerische Flugzeug-Werke, a builder of aircraft engines, but assumed the name Bayerische Motoren Werke in July 1917 and began producing motorcycles in the 1920s. BMW entered the automobile business in 1928.

The company introduced new car models in the 1930s but became increasingly involved in Germany's defense industry, building the world's first jet airplane engines during World War II. After the war the company met with failures in the consumer market—first in automobiles and next in motorcycles. By 1959, with BMW on the verge of bankruptcy and its managers planning to sell the firm to Daimler Benz, German entrepreneur Herbert Quandt intervened by purchasing a large stake in the company. BMW's fortunes improved with the rollout of the 700 series in August 1959.

Although it lost billions through the Rover Group (acquired 1994; sold 2000), BMW experienced great success with the relaunch of the British Mini in 2001. Another British brand, Rolls-Royce, became part of BMW in 2003. Members of the Quandt family continued to hold a significant stake in the company.

Bayes, Nora, original name DORA GOLDBERG (b. 1880, Joliet, Ill., U.S.—d. March 19, 1928, Brooklyn, N.Y.), American singer in vogue in the early 1900s in musical revues, notably the *Ziegfeld Follies*.

Bayes began her career in Chicago in 1899 and made her Broadway debut in 1901. She was identified with the songs "Down Where the Wurzbürger Flows" (1902) and "Shine on, Harvest Moon" (1908), which were written by her husband, Jack Norworth, who was her singing partner during their marriage (1908–13). During World War I Bayes introduced George M. Cohan's famous "Over There." In 1919 a New York theatre was named for her.

Bayes, Thomas (b. 1702, London, Eng.—d. April 17, 1761, Tunbridge Wells, Kent), English theologian and mathematician who was the first to use probability inductively and who established a mathematical basis for probability inference (a means of calculating, from the frequency with which an event has occurred in prior trials, the probability that it will occur in future trials).

Bayes set down his findings on probability in "Essay Towards Solving a Problem in the Doctrine of Chances" (1763), published posthumously. That work became the basis of a statistical technique, now called Bayesian estimation, for calculating the probability of the validity of a proposition on the basis of a prior estimate of its probability and new relevant evidence. Disadvantages of the method—pointed out by later statisticians—include the different ways of assigning prior distributions of parameters and the possible sensitivity of conclusions to the choice of distributions.

The only works Bayes is known to have published in his lifetime are *Divine Benevolence, or an Attempt to Prove That the Principal End of the Divine Providence and Government Is the Happiness of His Creatures* (1731) and *An Introduction to the Doctrine of Fluxions, and a Defence of the Mathematicians Against the Objections of the Author of The Analyst* (1736), which countered the attacks by Bishop George Berkeley on the logical foundations of Isaac Newton's calculus.
